efficacious images

EFFICACIOUS IMAGES

As odd or superstitious as it may appear to a scientific, secular view of nature, many religious images and objects are capable of great efficacy and able to protect against evil or misfortune, promote prosperity, heal illness, prompt fecundity, communicate favorably with the dead, or secure divine blessing. In fact, it may even be that such purposes constitute the greatest occasion for images in religious life. The reasons for attributing this kind of power to images or sculptures are as diverse as the psychological and sociological models for explaining their appeal. To those engaged in the visual practices of efficacious images, the reason is probably straightforward: properly crafted and consecrated, images are connected by virtue of tradition, ritual, and likeness to the realities to which they refer. They direct devotion, petition, and desire toward their intended end. And when that end is not achieved, it is not due to the failure of the image as a metaphysical device, but to the inappropriate ritual preparation of the image or the petitioner, or to the intervention of another will, human or divine. Even failure affirms the cultural system of efficacy—in the same way that a failed bridge does not move people in an industrial society to scrap bridge-making, but to reapply the principles of engineering and the methods of construction to create a more reliable bridge.

The horrific appearance of the Hindu goddess Kālī in the sculptural relief shown here (a) does not generate fear or revulsion toward the goddess among the faithful who bring their petitions and children before the image. Her fearsome countenance and brutal disemboweling of a figure actually suggest her vicious treatment of the evil afflicting those brought to her for healing, who will

The horrific appearance of the Hindu goddess Kālī in the sculptural relief shown here (a) does not generate fear or revulsion toward the goddess among the faithful who bring their petitions and children before the image. Her fearsome countenance and brutal disemboweling of a figure actually suggest her vicious treatment of the evil afflicting those brought to her for healing, who will

receive from her the strength she expends against the violated figure of evil upon which she stands. Likewise, the angry intensity of a wooden figure placed on the gable of a home in New Zealand **(b)** was not meant to deter family or friends from entering the home, but malicious spirits. Images charged with such tasks do so by communicating their intention and function to their human users in a routine of efficacy in which intention performs an important role. The medium of their efficacy is thought and feeling. Their very presence affirms the cultural logic of an entire way of life as the objects are viewed daily by their users and their neighbors.

Images are used for a great variety of purposes. Neolithic peoples in northern Europe probably used hand-held fertility figures like the so-called Venus of Willendorf **(c)** to enhance fecundity or secure safe child-

(b) LEFT. Gable figure used to thwart malicious spirits and protect inhabitants of the house, c. eighteenth century, carved wood, shell, human teeth, traces of red pigment, New Zealand. [*Masco Collection; photograph by Dirk Baker*] **(c) BELOW.** Venus of Willendorf, a hand-held female fertility figure, c. 28,000–25,000 BCE, carved limestone. Willendorf, Austria. [*Archivo Iconografico, S.A./Corbis*]

birth. Ancient Egyptians had themselves buried with small ceramic or wooden figures called *shawabtis* (d), which in the afterlife provided necessary service with food production and preparation. They were incised with magical formulae and hieroglyphics that identified their purpose and ownership. Some Jews and Muslims use the emblematic figure of a hand—called *hamsa* in Hebrew (e) and Arabic for “five,” often with scriptural texts inscribed on them—to shield them from the pernicious gaze of the evil eye. The origin of the *hamsa* pre-

dates both Judaism and Islam. In Hawai'i, figures were erected in male lodges for the purpose of protection (f).

Other images operate primarily as the means of directing petitions to divine forces or ancestors. For example, throughout India and among Hindus around the world, Gaṇeśa (g) is a favorite resource for overcoming obstacles associated with any aspect of life. In a like manner, practitioners of Santería create altars to the *orishas*, or deities whom they worship, such as the one shown here (h). Roman Catholics direct their petitions to Saint Jude. Buddhists in Thailand and elsewhere apply gold leaf to sculptures of the Buddha (i) as acts of personal devotion and prayer that can solicit a portion of the Buddha's merit. Thai Buddhists hope that such a favorable karmic act will generate a beneficial consequence in this life or higher

rebirth in the next. Tibetan Buddhists make use of prayer wheels (**j**), which generate prayers at a multiplied rate as they are spun by the faithful. In addition to these uses, images serve as devices for directing influence (malicious or benevolent) toward another. A Congolese charm or spirit container (**k**), for example, is a receptacle invested with items belonging to a petitioner or those of a targeted party and charged with the task of exerting influence.

Images are often made and used to assist with burial, memorial, and grief. Nineteenth-century American parents often had postmortem photographs made of their children. One of these is paired here with a photograph

(**j**) ABOVE. Buddhist pilgrims in Lhasa, Tibet, spin prayer wheels, which generate prayers at a multiplied rate. [©Galen Rowell/Corbis] (**k**) LEFT. A nineteenth-century African Bakongo sculpture of a male figure, made from wood, glass, fiber, nails, and bone. The figure includes a spirit container (*nkisí*) used to instruct or admonish spirits. [©Burstein Collection/Corbis]

of the child taken during life **(l)**. The image on the left is the deceased, whose horizontal position in death has been changed to appear vertical, as if the child has not died, but poses peacefully asleep. Such imagery may have denied the death for grieving parents, or may have mitigated it to a peaceful slumber. If such images bring to mind the carefully prepared image of the corpse and in some vitally therapeutic manner replace the dead body and lost person with a memory image, traditional inhabitants of the Melanesian island of New Ireland used elaborate mortuary masks **(m)** to remove the spiritual traces of the deceased from his or her household. Dancers wearing such masks

(l) ABOVE. Paired photographs of a young girl who lived in the United States during the nineteenth century. The photograph on the left was taken shortly after her death. [Courtesy of Jay Ruby, Center for Visual Communication] **(m)** RIGHT. A Murua mask from New Ireland in Papua New Guinea, made from carved wood, sea sponge, and snail opercula. Such mortuary masks were used to remove traces of deceased relatives from the home.

appeared at the home of the deceased in order to cleanse it of taboos by attracting any aspect of the dead away from the home to the site where the body had been cremated.

Perhaps the most common use of imagery is among rites of passage, when members of a society undergo crucial transpositions from one status or age to another. Images often serve to commemorate the event or to assist in the metaphysics of change. In the case of Papuan peoples, ancestors must be engaged to bless and guide the passage, to confer the new status, and to legitimate the change by bringing the initiate into the presence of the extended clan, represented by the totemic figures often included with such figures as the one reproduced here (n).

AN OVERVIEW
FEMINIST PERSPECTIVES

MARY: AN OVERVIEW

The New Testament description of Maria, or Mariam, includes Mary's virginal conception of Jesus. Preeminent among the saints, the Virgin Mary later became the object of piety and cult and, especially in the Roman Catholic church, of dogmas such as the immaculate conception and the assumption. Protestant treatment of her as a biblical saint varies. She is honored in the Qur'ān (*sūras* 3 and 19), Shī'ah speculation, and Ṣūfī mystical traditions (see Tavard 32–45, Pelikan 67–79). There is some Jewish interest in Mary as a Jewish mother and link to the people of Israel (Flusser).

Traditionally, Mary has been presented by combining all the references to her in the Gospels and *Acts of the Apostles* and viewing them in the light of the infancy narratives (*Mt.* 1–2, *Lk.* 1–2), which have been taken as her memoirs revealed years later to an evangelist. These accounts have then been psychologized and interpreted in light of later Marian thought. Further, *Revelation* 12, which speaks about “a woman clothed with the sun, with the moon under her feet, and on her head a crown of twelve stars,” who gives birth to a male child who in turn is caught up to God after escaping a dragon on earth, has been regarded as a reference to Mary. Similarly, passages in the Hebrew scriptures have been said to refer to Mary; in *Genesis* 3:15 she (as the Vulgate reads) “shall bruise” the serpent's head; in *Isaiah* 7:14 (*Mt.* 1:23) a young girl (Septuagint, “virgin”) shall give birth to a son; in *Proverbs* 8 and other passages about Wisdom (personified as a woman); and in the female figure of the daughter of Zion (e.g., *Zep.* 3:14–20). On Old Testament typologies in patristic sources, see Pelikan 23–36, 41–45.

[©Archivo Iconografico, S.A./Corbis].

Modern scholarship finds differing pictures of Mary in each gospel. Earlier accounts can be ascertained from sources used by the gospel writers, and a “historical Mary” can be sought behind such sources. The concatenation of biblical images, together with evolving Marian piety and influences from other religions, led to post–New Testament developments that were initially connected with Christology, then with ecclesiology, but by the Middle Ages and certainly since the seventeenth century, Roman Catholic dogmatics were treated separately as Mariology. Pelikan treats her many titles like “the second Eve” and “black Madonna.”

MARY IN THE NEW TESTAMENT. The *Gospel of Mark* (written about 70 CE) describes Jesus’ mother and brothers on the edge of a crowd listening to him teach (*Mk.* 3:31–35). “His own” (3:20), likely “his family” (NRSV), have come to take him away because Jesus was, they thought, “out of his mind”; they are like the hostile scribes who claim that he is “possessed by Beelzebul” (3:22). In *Mark* 3:34–35, Jesus designates as “my mother and my brothers” those who do the will of God, thus contrasting his natural family, including Mary, with his “eschatological family” of disciples. The passage in *Mark* 6:1–6a, about the rejection of Jesus in his home synagogue, shows Mary and Jesus’ brothers sharing the unbelief of those of the surrounding countryside; 6:3, “son of Mary,” does not indicate either virgin birth or illegitimacy (contrast Schaberg). References to another Mary, in addition to Mary Magdalene, in 15:40, 15:47, and 16:1 do not denote Jesus’ mother. Hence the overall picture of Mary in *Mark* is a negative one. (For details, see Brown et al., 1978, pp. 51–72, 286–287.)

In the *Gospel of Matthew* (perhaps before 90 CE), a more positive view of Mary results, especially from the first two chapters about the birth and infancy of Jesus, the fruit of meditation upon the Hebrew scriptures within the Matthean community. The genealogy (*Mt.* 1:1–17), from Abraham through David to “Jesus who is called the Messiah,” mentions five women, including “Mary, of whom [fem.] Jesus was born” (1:16). This genealogy was probably designed to emphasize how God carried out his plan to save his people through Jesus the Messiah (1:21) in spite of “marital irregularities” in each of the cases of the five women. With Mary, the irregularity is that Joseph learns she is with child “from the Holy Spirit.” But this is in accord with God’s plan (*Mt.* 1:21–22). That the women were “threats” but “vulnerable” is stressed by Gaventa 32–46. The evangelist cites *Isaiah* 7:14 (Septuagint) to verify that a virgin has conceived and that the child will be “God with us” (*Mt.* 1:23).

Matthew’s portrait of Mary during the ministry of Jesus is also ameliorated by other details. In the scene of Jesus’ eschatological family (*Mt.* 12:46–50) no reference is made to Jesus’ natural family coming to take custody of him. In the synagogue scene at Nazareth (*Mt.* 13:53–58), Matthew drops out the Marcan reference to “his own kin” in what Jesus says (13:57; cf. *Mk.* 6:4).

The most positive synoptic portrayal of Mary comes in the *Gospel of Luke* plus *Acts* (perhaps after 90 CE). In *Acts* 1:14, Mary is a member of the Jerusalem church. In *Luke* 1–2, Mary is described as Joseph’s “betrothed” (*Luke* 2:1–20, where, however, a virgin birth is not mentioned). More striking are (1) the scene where the angel Gabriel tells Mary that she will bear “the Son of the Most High” and “The Holy Spirit will come upon you, and the power of the Most High will overshadow you” (God’s creative activity, *Acts* 1:8; *Gen.* 1), and Mary responds, “Let it be with me according to your word” (*Lk.* 1:26–38, Mary’s faith); (2) the story of Mary’s visit to Elizabeth (*Lk.* 1:39–56) and Mary’s song, the Magnificat (1:46–55, Mary as prophetess), in particular, the words about her blessedness (esp. 1:42 and 1:48); (3) the account of Mary in the Jerusalem Temple where she comes for purification after childbirth and where Jesus is presented to the Lord (*Lk.* 2:21–40); and (4) the story of Jesus in the Temple as a twelve-year-old (*Lk.* 2:41–52). These accounts show Mary’s faith in God (*Lk.* 1:38, 1:45); tell of the virginal conception (*Lk.* 1:31–34, cf. 3:23) and of Mary’s status as a “favored one” (*Lk.* 1:28; Vulgate, *gratia plena*), employing the term *hail* (*ave*); and relate Simeon’s prophecy to Mary: “A sword will pierce your own soul too” (*Luke* 2:35; Mary, also, must transcend the natural bonds of family and come to faith in Jesus). This she does, for Jesus declares blessed not the womb that bore him but those who hear and keep God’s word (*Lk.* 11:27–28). The rejection scene at Nazareth (*Lk.* 4:16–30) is presented very differently, and the saying about Jesus’ eschatological family (*Lk.* 8:19–21) lacks any contrast with his natural family. In *Luke* 2:19 and 2:51, Mary ponders over Jesus’ birth and thus grows in faith and discipleship.

The *Gospel of John* (c. 90) contains no reference to the virgin birth, in part because the preexistence and incarnation of the Word are emphasized (*Jn.* 1:1–18). The scenes involving “the mother of Jesus” (never “Mary”) during Jesus’ ministry are totally different from those in the Synoptic Gospels. In the story about a wedding feast at Cana (*Jn.* 2:1–11), his mother does not yet seem to have grasped that his “hour” does not parallel the wishes of his natural family. Although she accompanied Jesus to Capernaum (*Jn.* 2:12), perhaps this was because she was seeking to bring him home (cf. *Mk.* 3:20–35). The mother of Jesus appears in one other Johannine scene (*Jn.* 19:25–27), standing at the foot of the cross with the Beloved Disciple. This *stabat mater* reference occurs only in *John*, among all the Gospels.

Earlier New Testament writings, like Paul’s letters (c. 50–60, *Gal.* 4:4, antidocetist), make no reference to Mary, nor does the Q source, a reconstructed collection of Jesus’ sayings, presumed to have been used by Matthew and Luke. A pre-gospel tradition could be behind *John* 2:1–11, or a common source could be the basis of the Matthean-Lukan stories of Mary’s conceiving and the genealogy. More likely these are deductions of post-Easter Christology, theologoumena, dramatizing the divine origins of Jesus.

Regardless of the backgrounds and symbolism of the scene in *Revelation* 12 that are suggested by scholarship in the history of religions, the passage is intended to assert God's triumph in Christ over Satan's attacks. The woman who gives birth to the Messiah is Israel and the church, Christ's suffering people. Marian applications to the passage developed only in the fourth century.

MARIAN PIETY AND MARIOLOGY. In the second century, references to Mary are rare, found chiefly in the letters of Ignatius of Antioch about the "mystery" of Jesus' birth (e.g., *Ephesians* 19.1) and in Justin Martyr (*Dialogue with Trypho* 100). Justin typologically compares Eve and Mary, a theme developed by Irenaeus (*Against Heresies* 3.21.10). The New Testament Apocrypha and gnostic documents from Nag Hammadi expand references to Mary (see Tavard 17–31). The *Protevangelium of James* (an infancy gospel and life of Mary, written mid-second century), with its hagiographic details, was to have great influence. It said that Mary remained a virgin while delivering her son (*in partu*) as well as after Jesus' birth (*virginitas post partum*). Growing Christian emphasis on asceticism, with Mary as virgin model, and contacts with "mother goddesses" in other religions, especially in Asia Minor, encouraged Marian themes. But even in the third century there is no trace of belief in Mary's assumption into heaven (Brown et al., 1978, pp. 241–282).

Popular piety concerning Mary usually developed first in the East, often involving icons (see Tavard 67–73) and in a liturgical context, sometimes involving groups deemed heretical. The West was often more sober in its piety (see Tavard 65–100). The prayer in the Byzantine liturgy *Sub tuum praesidium confugimus* ("Under your mercy we take refuge, O Theotokos . . .") has been traced back to the fourth century or earlier (for details, see O'Carroll, 1983). In the *Refutation of All Heresies* 78–79 (c. 375), Epiphanius, bishop of Cyprus, refers both to "opponents of Mary" who denied that she was perpetually a virgin (Gr., *aeiparthenos*; Lat., *semper virgo*), and to the Collyridians, women who offered cakes (*kollyrides*) to the Virgin as a goddess (cf. *Jer.* 7:18, 44:15–28). At the Second Council of Nicaea (787) clear distinctions were made: *latr(e)ia* ("worship") is for God alone; *d(o)ul(e)ia* ("reverence"), for the saints; and *huperdouleia* ("more than reverence"), for Mary.

In the Christological controversies of the fifth century, Mary took on more and more of the status of her Son. While Nestorius (d. 451) was willing to call Mary *christotokos* ("the one who bore Christ"), he boggled at the term *theotokos*, "God-bearer." This term became the rallying cry of Cyril of Alexandria (d. 444) and was proclaimed as a title for Mary at the councils of Ephesus (431) and Chalcedon (451). The intent was to assert that he whom Mary bore was, while "truly man," also "truly God." Use of the term *theotokos* also led to emphasis on Mary not simply as *Dei genitrix* ("she who gives birth to God") but also as *mater Dei*, the "mother of God" (see Tavard 49–64; Pelikan 55–65).

Marian festivals generally developed in the East and then spread elsewhere. They multiplied in number. Some had biblical roots, for example, the Annunciation on March 25 (*Lk.* 1:26–38) and the Purification on February 2 (*Lk.* 2:21–39, cf. *Lv.* 12). Others, like the Nativity of the Blessed Virgin Mary (September 8) and her Presentation in the Temple (November 21), have their roots in the *Protevangelium of James*. The fifteenth of August became the date for the Dormition, or "falling asleep" of the Virgin. Later there arose accounts of Mary's bodily assumption into heaven, paralleling Jesus' exaltation. Mary was regarded as now reigning with her Son, and thus she could be intercessor, or mediatrix, with Christ and God. A legend about Theophilus, who made a pact with the devil but obtained forgiveness through Mary, was an indication of her power to intervene. The Feast of the Immaculate Conception of Mary (December 8 or 9) arose around the theme of her sinlessness from the time of her birth (cf. *Protevangelium of James* 4). However, in the West there was a long debate over Mary's sinlessness in light of the Augustinian doctrine of original sin; the Franciscans promoted the feast, while the Dominicans (including Thomas Aquinas) opposed it.

Celebration of Mary had now moved from the realm of Christology to that of ecclesiology. Mary was Mater Ecclesiae ("mother of the church"), for she had brought forth Christ, the head of the church. One principle at work was "*potuit, deuit, fecit*": God *could* do a thing, it *was fitting* that God should, and therefore God *did* it—for example, God saw to it that Mary was born or exalted much like her Son. Other principles were exhibited by Bernard of Clairvaux's dictum "Everything through Mary" and the widespread medieval belief that one can never say too much about Mary. Reflections of this cascading piety can be seen in the Akathistos, a Greek hymn of the fifth or sixth century that has elaborate epithets for Mary, or in Western antiphons like *Alma redemptoris mater* (Sweet Mother of the Redeemer), or in the Ave Maria prayer ("Hail, Mary," *Luke* 1:28 and 1:48, with the later addition of "Pray for us sinners . . ."). Poetry, often outside the churches, e.g., by the English Romantics and pre-Raphaelites, and literature sometimes hailed Mary (see Tavard 153–167; Pelikan 165–175).

Some of the Protestant reformers (see Pelikan 153–163), including Ulrich Zwingli (see Tavard 104–109), grew up under the high Mariology of the late Middle Ages and its piety. Luther seems at times to have affirmed Mary's immaculate conception and even her bodily assumption and retained some Marian festivals, but with a Christological emphasis. More revealing is Luther's 1521 exposition of the Magnificat (*Works*, Saint Louis, 1956, vol. 21, pp. 297–358), where Mary is "the foremost example" of God's grace and of proper humility. The Lutheran confessions simply assume the virgin birth of Jesus Christ and even use stock phrases like *semper virgo*. But Calvin, who praised Mary as "holy virgin," expressed misgivings about calling her "mother of God." Protestant reaction to the post-Tridentine

emphases in Roman Catholicism gave Mary less and less place (see Tavard 117–130; Dawe). Anglicanism often shares in (Roman) Catholic tradition about Mary, though not in the papal magisterium seen in the dogmas of 1854 and 1950 (see below; Tavard 134–152).

Eastern Orthodox regard for Mary has continued as living piety, but without the emphasis on dogmatic articulation found in Roman Catholicism (see Nikos Nissiotis, in *Concilium* 168, 1983, pp. 25–39, with bibliography). “Sophiology,” Mary as created Wisdom (Sophia), developed especially in nineteenth-century Russian Orthodoxy (see Tavard 78–79; O’Carroll, *Theotokos* 332 and 90–92 on Sergius Bulgakov, 1817–1944). For Roman Catholic theology, the seventeenth and eighteenth centuries brought new developments in spirituality having to do with Mary (for example, the devotion to the Immaculate Heart of Mary promoted by Jean Eudes, 1601–1680). In Italy, Alfonso Liguori (1696–1787) gathered stories about the Virgin in his book *The Glories of Mary*. Emphasis on Mary was encouraged by reported visions and appearances (Pelikan 178–187), for example, at Lourdes in 1858, with the announcement, “I am the Immaculate Conception,” at Fatima, Portugal in 1917, and Medjugorje in Bosnia-Herzegovina, beginning in 1981 (appearances have been claimed more frequently in the twentieth century than any previous time, so Tavard 186); also by international Marian congresses; by Marian years proclaimed by the pope; and by pilgrimages (for example to Czestochowa in Poland, Guadalupe, Mexico).

Reflective of such popular piety was Pius IX’s 1854 definition of the immaculate conception as dogma for Roman Catholics in *Ineffabilis Deus*: “The most blessed Virgin Mary . . . was preserved free from all stain of original sin.” In 1950, Pius XII defined the assumption of the Blessed Virgin Mary as a dogma in the apostolic constitution *Munificentissimus Deus*: “The Immaculate Mother of God, the ever Virgin Mary . . . was assumed body and soul to heavenly glory.” Protestant reaction was negative. The Orthodox reacted against the 1854 dogma because of their belief that everyone, Mary included, is afflicted with sin in the sense of human infirmity, but in 1950 they reacted only against papal claims of authority inherent in the proclamation (see Pelikan 189–213). Some Catholics have called for ecumenical rewriting of these dogmas (see Tavard 200).

Although some Catholic “maximalists” on Mary hoped that the Second Vatican Council would declare her coredemptrix with Christ, the council did not make such a statement. In fact, it voted in 1963 to include the material on Mary as chapter 8 of the Constitution on the Church, *Lumen gentium*, rather than to treat it as a separate schema. The dogmatic constitution treats her role in the economy of salvation, as Mother of God and of the Redeemer, as a model for the church, and as a sign of hope and solace for God’s people in pilgrimage. There are also paragraphs on devotion to the Blessed Virgin, warning against exaggeration. However, the speech by Paul VI in 1964, promulgating *Lumen gentium*,

proclaimed Mary as Mater Ecclesiae, and his apostolic exhortation in 1974, *Marialis cultus*, sought for renewal in devotion to Mary and called her “our sister.” John Paul II has spoken frequently in traditional Marian terms, often devotionally (*Redemptoris mater*, 1987, announcing a Marian jubilee for 1987–1988, leading toward the bimillennium in 2000 of Jesus’ birth). The net effect since Vatican II has generally been a greater restraint and balance in Roman Catholic Mariology and in Catholic devotional life. Some statements have suggested that Mary provides “the model of all real feminine freedom” (U.S. Catholic Bishops, *Behold Your Mother*, 1974). But for many feminists, Mariology, certainly in the church writers of the early centuries, has been all too androcentric (cf. Borrensens, Halkes, and Moltmann-Wendel, in *Concilium*, 168, 1983; contrast at points Tavard 49–57, 221–266). In ecumenical dialogues the fullest treatment has come in the United States “Lutherans and Catholics in Dialogue VIII,” *The One Mediator, the Saints, and Mary*, ed. H. George Anderson, J. Francis Stafford, and Joseph A. Burgess (Minneapolis, 1992); “saints” and prayers for and to deceased saints proved more divisive than did Mary.

JOHN REUMANN (1987 AND 2005)

MARY: FEMINIST PERSPECTIVES

The Virgin Mary has been a central figure in Catholic and Orthodox Christianity since the time of the early church. Although Marian devotion often has been aligned with papal power and Catholic imperialism, Mary also has been a focal point for popular devotional practices, legends, and folklore in Catholic culture, including those which express women’s concerns with childbirth, motherhood, marriage, and religious life. Mary is a complex topic for feminist analysis, since the priorities and perspectives of a Western-educated feminist are likely to be different from those of a poor, illiterate Catholic woman, for whom the Virgin Mary nevertheless may be a potent source of inspiration and consolation.

FEMINIST PERSPECTIVES. The most common feminist critique of the Marian tradition focuses on the association between Mary and Eve, which is perceived as a destructive form of dualism that informs Christian concepts of womanhood. As the new Eve, Mary has been represented as the faithful, obedient virgin who brought life to the human race through her motherhood of Christ, whereas Eve has signified the disobedient virgin, the sexual temptress who brought death to the human race by eating the forbidden fruit and enticing Adam to eat it.

In parallel with the denigration of female sexuality in Eve’s association with temptation, sin, and death, Mary’s virginal motherhood is seen by feminist critics as representing an impossible ideal for women. The Christian understanding of female virtue has been constructed to a large extent around the contrast between Mary’s virginal obedience, passivity, and modesty before God and Eve’s disobedience, sexual incontinence, and susceptibility to temptation. This contrast has been exacerbated in the Roman Catholic tradition by the valuing of celibacy over marriage; as a result women have been identified with Eve as posing the ultimate threat to the spiritual and moral well-being of the celibate male.

CONTEMPORARY WRITINGS ON MARY. Although there is a long tradition of women’s writings on Mary, contemporary feminist interpretations must be understood in the context

of the Second Vatican Council (1962–1965). The question of Mary’s place in the church generated some of the most heated debates in Vatican II (at which no women were present), and the council’s teachings on Mary eventually were incorporated into Chapter 8 of the document on the church, *Lumen Gentium*. Although *Lumen Gentium* emphasizes the unique dignity and privilege of Mary in her role as Mother of God, it also portrays her as the model of Christian discipleship and prayer.

After Vatican II, Catholic interest in Mary declined dramatically, and thus it is not surprising that she attracted relatively little attention from early feminist theologians. Those who did write about Mary tended to follow the trend of Vatican II, emphasizing her biblical persona as the poor woman of Nazareth and an exemplary disciple rather than her transcendent mystical significance as the Mother of God or her cultic role in popular devotions and feasts (Ruether, 1993). Feminist liberationist theologians saw Mary as a source of inspiration for the struggles of the poor and the oppressed, identifying her with the words of the Magnificat attributed to her in Luke’s gospel (1:46–55). The Brazilian theologians Ivone Gebara and Maria Clara Bingemer (1989) proposed a feminist liberationist understanding of Mary that seeks to reconcile her human significance as Mary of Nazareth and her transcendent universality as the Mother of God.

Alongside these liberal and liberationist perspectives, some feminist thinkers have attempted to reclaim Mary’s significance as the unacknowledged goddess of the Christian tradition (Baring and Cashford, 1993). From this perspective, the early church only partially defeated the goddess religions of the ancient world. Those religions were subsumed and incorporated into Christianity in the status and devotion accorded to the Virgin Mary while being divested of their potent matriarchal significance in the context of a patriarchal religious culture.

This is one of the ideas explored by Marina Warner (2000) in her feminist analysis of the development of Marian devotion and doctrine. Warner presents the Marian tradition as historically significant but anachronistic in terms of the aspirations, values, and questions of contemporary secular society, although in more recent editions of her work she has modified this stance by acknowledging the enduring capacity of Mary to meet the religious need for a mother goddess figure. Others, such as Charlene Spretnak (2004), offer a more positive affirmation of the need to recognize Mary’s potential in terms of a maternal feminine divine presence in the Catholic tradition. Spretnak criticizes the Second Vatican Council for divesting the Marian tradition of much of its power and argues for the rediscovery of Marian devotion as an important aspect of feminist spirituality.

Mary is also a significant figure in the writings of the psycholinguistic theorists Luce Irigaray and Julia Kristeva. For Irigaray she represents the missing feminine dimension of the Incarnation. Irigaray (1991) argues that the fertile, corporeal, and maternal aspects of the Christian story have

been neglected in favor of a life-denying religion based on the patriarchal and sacrificial relationship between a Father God and his crucified Son. Kristeva (1987), drawing on the insights of psychoanalysis, sees the cult of the Virgin Mary as contributing to the sublimation rather than the repression of the maternal relationship in Catholic Christianity, including its associations with the body, desire, and death.

These theoretical insights have informed feminist Mariology, particularly in the work of Tina Beattie (2002). A different critical perspective is offered by Sarah Jane Boss (2000). Drawing on the critical theory of the Frankfurt school in her reading of the Marian tradition, Boss argues that the increasing trend toward the domination of nature and the female body is reflected in changing attitudes toward the Virgin Mary in Western culture.

As a visible and ubiquitous symbol of maternal femininity in the Christian tradition the Virgin Mary is a vast cultural presence and historical influence whose significance has not been recognized fully by many secular feminists. The traditions, theories, and practices that surround her are too diverse and enigmatic to lend themselves to a straightforward feminist analysis or theory. However, it is hard to see how any feminist approach to questions of religion, history, and ethics in Western culture can ignore the extent to which the Marian tradition has shaped attitudes toward women in ways that extend beyond the doctrinal beliefs and devotional practices of Catholic Christianity.

BIBLIOGRAPHY

- Baring, Anne, and Jules Cashford. *The Myth of the Goddess: Evolution of an Image*. London and New York, 1993. In this extensive study of goddess religions the authors argue that Eve and Mary are the repressed goddess figures of the Jewish and Christian traditions.
- Beattie, Tina. *God's Mother, Eve's Advocate: A Marian Narrative of Women's Salvation*. London and New York, 2002. Beattie engages with French psycholinguistic theory in her reading of the Marian tradition. By comparing the symbolic significance of Eve and Mary in patristic theology with their representation in recent Catholic writings, she argues for the transformation of Marian symbolism through a feminist engagement with the beliefs of the early Church.
- Boss, Sarah Jane. *Empress and Handmaid: Nature and Gender in the Cult of the Virgin Mary*. London and New York, 2000. This analysis of the development of the Marian tradition draws on both theology and sociology. In light of the critical theory of the Frankfurt school and its critique of domination, the author argues that changing attitudes toward nature and the female body in Western culture are reflected in Marian doctrine and devotion.
- Gebara, Ivone, and María Clara Bingemer. *Mary: Mother of God, Mother of the Poor*. Tunbridge Wells, U.K., 1989. These Bra-

zilian theologians draw on the insights of feminist and liberationist theologies to offer a Mariology that encompasses both the human dimension of Mary as a woman in history and the transcendent significance of Mary as a universal symbol of liberation and redemption.

- Irigaray, Luce. *Marine Lover of Friedrich Nietzsche*. New York, 1991. The last chapter of this book, "Epistle to the Last Christians," offers the author's most sustained engagement with the Marian tradition, although references to the Virgin Mary are scattered widely throughout her work.
- Johnston, Elizabeth A. *Truly Our Sister: A Theology of Mary in the Communion of Saints*. London and New York, 2003. The author rejects the iconic status of Mary in order to emphasize her humanity as a woman who struggles in solidarity with other women.
- Kristeva, Julia. "Stabat Mater." In *Tales of Love*. New York, 1987 (first published in 1983). This lyrical essay, written as two sides of a dialogue, explores the relationship between the maternal body and Marian doctrine and devotion.
- Ruether, Rosemary Radford. *Sexism and God-Talk*. London: 1992 (first published in 1983). Chapter 6, "Mariology as Symbolic Ecclesiology: Repression or Liberation?" proposes a feminist liberationist Mariology based on the identification of Mary with the church.
- Spretnak, Charlene. *Missing Mary: The Queen of Heaven and Her Re-Emergence in the Modern Church*. Basingstoke, U.K., 2004. The author criticizes the Second Vatican Council for its minimalist approach to Mary and advocates a rediscovery of Marian devotion and mysticism as a potent expression of feminist spirituality.
- Warner, Marina. *Alone of All Her Sex: The Myth and Cult of the Virgin Mary*. London, 2000 (first published in 1976). This scholarly and wide-ranging evaluation of the Marian tradition remains one of the most influential feminist critiques.

TINA BEATTIE (2005)

MARY MAGDALENE. Mentioned by name in only fourteen verses in the New Testament, Mary Magdalene is nevertheless one of the most important and influential figures in the history of Christianity. Mary came from a prosperous town on the shores of the Sea of Galilee, which in the canonical gospels is called by its Aramaic name, Magdala. In Greek it is known as Tarichaeae. In antiquity the town had a reputation for exporting quality salt fish and fish oil. It is possible Mary herself was engaged in some business related to the fishing industry. This occupation is well attested for women in early Roman Palestine, and the Herodian court at nearby Tiberias regularly purchased goods from female suppliers. When Mary is introduced in *Luke* 8:2, she is in the company of Joanna, the wife of a Herodian official, suggesting Mary had contact with the court.

Luke presents Mary Magdalene as one who followed Jesus during his ministry in the Galilee. According to the third gospel, Jesus healed Mary of an unspecified disorder, which singles her out as the only close companion whom he

cures. *Luke* also records that Mary “ministered” (the Greek verb means “to care for” or “to provide”) to Jesus and his followers “out of [her] resources.” The verse may recall Mary’s patronage as a well-to-do businesswoman.

Whenever a group of women followers is listed in the canonical gospels, Mary is mentioned first, an indication of her preeminence. The gospels also relate that Mary is present at the crucifixion in Jerusalem. Finally, she is the only person to be named in all four gospels as a witness to the resurrection, subsequently qualifying her to receive the accolade of apostle.

MARY IN NON-CANONICAL LITERATURE. In the late nineteenth century fragments of an extra-canonical gospel written in the name of Mary Magdalene were found. The discovery of an incomplete Coptic manuscript was followed in the early twentieth century by the recovery of additional portions of the text in Greek. Scholars generally date its composition to the second century. The gospel portrays Mary as the recipient of a vision of Christ in which she is praised for her fidelity. Peter appears as an adversary, attacking Mary when she explains her vision. Peter asks incredulously whether Jesus really did “speak with a woman without our knowledge [and] not openly.”

The *Gospel of Thomas*, also a second-century text, depicts Peter’s attempt to discredit any authority Mary possesses among the disciples, attributing to him the declaration, “Let Mary leave us, because women are not worthy of life.” The risen Jesus refutes Peter’s dismissal, replying, “Look, I myself shall lead her so that I will make her male in order that she too may become a living spirit resembling you males. For every woman who makes herself male will enter the kingdom of heaven.”

A large corpus of Gnostic literature found at Nag Hammadi, Egypt, in 1945 was published in the 1970s. The texts include a number of extra-canonical manuscripts concerning Mary Magdalene, notably the third-century *Pistis Sophia*, the *Gospel of Philip*, and the *Dialogue of the Savior*. The *Sophia of Jesus Christ* was dated to the early fourth century, although some scholars argue that it exhibits features suggesting an earlier date of composition. These writings aroused new interest in Mary’s relationship with Jesus and in her authority among early Christians. They also indicate a wide diversity of teaching during the formative years of the new religious movement.

Mary is depicted in the Gnostic works as having a particularly intimate relationship with Jesus. She is praised as worthy of having received private teaching from him and she is presented as a leader within the Christian community. Of particular interest, the *Gospel of Philip* portrays Mary as the one whom Jesus loved more than the other disciples and as one whom he kissed frequently. The act of kissing as a greeting and sign of affection is well attested as a common practice among early Christians, as Paul’s epistles witness. Jesus’ kiss, therefore, does not necessarily imply a sexual relationship,

though some twentieth-century commentators have interpreted it that way.

Peter appears in the Gnostic texts consistently opposing Mary’s authority. As a result, some scholars suggest that the Gnostic writings reveal a struggle within the early church between a faction that recognizes in Mary a model for women’s authority and leadership, and a Petrine group that opposes women’s authority. Other scholars interpret Peter as representing the emerging orthodox position, while Mary stands for the Gnostic view.

“APOSTLE TO THE APOSTLES.” Writing in *Galatians* 1:11–17, Paul intimates that an apostle is one who receives an appearance of the risen Lord and one who is commissioned to proclaim his message. In the canonical gospels Mary is recorded as fulfilling both of these conditions. Hippolytus, a third-century bishop, is generally thought to be the first person to name her as an “apostle to the apostles.” Augustine of Hippo in the fourth century and John Chrysostom in the fifth also accord Mary this title. Some scholars argue that the appellation of apostle is honorific in Mary’s case. However, as she meets the criteria, there seems no need to assume the title was anything less than recognition of her apostleship. The persistence and survival of the epithet confirm Mary’s importance among early Christians.

In the sixth century Pope Gregory I (the Great) declared that Mary Magdalene was beloved of the savior and was the leader of a group of apostles. He also proclaimed that the Galilean Mary Magdalene, the Judean Mary of Bethany, and the other Mary were one and the same person, conflating three distinct women. In the West, pious myths arose based on the conflation. According to an eleventh-century tradition, Mary, now identified as the sister of Martha and Lazarus, introduced Christianity to France. In eastern Christianity the confusion did not arise, for the distinctions among the women were maintained.

MARY THE PENITENT. Mary’s reputation as an apostle, preacher, and leader declined as male authority increased in orthodox Christianity. Gregory I not only conflated three Marys, he also made Mary Magdalene into a prostitute, declaring her a redeemed whore in a sermon in 591. Mary was stigmatized as a prostitute through an association with the unnamed sinner mentioned in *Luke* 7:36–50, an erroneous identification that endured for fourteen hundred years. In church teaching and Christian art, Mary was portrayed as a model of repentance and was used as a propaganda tool. Her misrepresentation served the purposes of a church promoting asceticism, by making her into a moral paradigm: the unfaithful harlot forgiven and restored.

Scholarly consensus since the 1980s has returned Mary Magdalene to her position of authority and leadership in early Christianity. The identification of her as a prostitute has been exposed as mistaken and rejected for lack of evidence. Study of the noncanonical literature has revealed that Mary’s influence endured for at least six centuries prior to her conflation with Mary of Bethany and the so-called other

Mary. At the same time, the Gnostic literature has raised questions about early Christian teachings regarding the salvation of women. Mary's canonical role as a close associate of Jesus, a faithful disciple, and a witness to the resurrection, coupled with the noncanonical accounts of her as a preacher and missionary, have revised her memory as a role model for Christian women.

BIBLIOGRAPHY

- Boer, Esther de. *Mary Magdalene: Beyond the Myth*. Translated by John Bowden. Harrisburg, Pa., 1997. De Boer revisits the tradition of Mary Magdalene as a redeemed prostitute. She examines both the canonical literature and the *Gospel of Mary*, placing the accounts in their historical, social, cultural, and theological contexts within formative Christianity. De Boer's work concludes that Mary was not a penitent whore, but a courageous and persistent disciple.
- Brock, Ann Graham. *Mary Magdalene, the First Apostle: The Struggle for Authority*. Cambridge, Mass., 2003. This revised doctoral dissertation argues that the Magdalene fulfills the criteria of an apostle. Brock carefully and persuasively reexamines the canonical gospel portraits, particularly those of Luke and John, before turning to the Gnostic literature. Her treatment of a frequently hypothesized rivalry between proponents of the Magdalene and a Petrine group is especially instructive. Brock provides a comprehensive bibliography of the literature in French, German, Italian, and English.
- Haskins, Susan. *Mary Magdalen: Myth and Metaphor*. London, 1993. Haskins explores how the story of the Magdalene has been transmitted through Christian history not only by means of biblical and early Christian texts, but also through visual representations from the mid-third century through the last decade of the twentieth century. Haskins's analysis of the texts seems rudimentary compared to subsequent studies, but as one of the first scholarly works on Mary Magdalene, her book remains an important contribution. It is particularly valuable for its medieval representations.
- Jansen, Katherine Ludwig. "Maria Magdalena: *Apostolorum Apostola*." In *Women Preachers and Prophets through Two Millennia of Christianity*, edited by Beverly Mayne Kienzle and Pamela J. Walker, pp. 57–96. Berkeley, Calif., 1998. Jansen notes that between the eleventh and sixteenth centuries medieval preaching circulated the story of the Magdalene as *apostola*. She looks at examples that draw upon pious traditions presenting Mary as a model missionary.
- King, Karen. *The Gospel of Mary of Magdala: Jesus and the First Woman Apostle*. Santa Rosa, Calif., 2003. A scholar of Gnosticism, King argues the *Gospel of Mary* privileges inner spiritual knowledge over externally acquired knowledge. She examines the *Gospel's* teaching on various topics such as the body, women's authority, and visionary experiences, pointing out that the writing rejects Jesus' suffering and death as a path to eternal life.
- Marjanen, Antti. *The Woman Jesus Loved: Mary Magdalene in the Nag Hammadi Library and Related Documents*. Leiden, 1996. This study, a revised dissertation, evaluates the descriptions

of Mary Magdalene found in Gnostic literature. It concludes that she is presented as a prominent, even intimate, disciple of Jesus, who is a role model for women in early Christian communities. Marjanen observes a tension, however. Although Mary Magdalene is commended, the language subversively reflects a patriarchal culture that connects the male with the spiritual, perfect, and transcendent and the female with the sensual, incomplete, and mundane.

Robinson, James M., ed. *The Nag Hammadi Library in English*. Translated by members of the Coptic Gnostic Library Project of the Institute for Antiquity and Christianity. San Francisco, 1977.

Schaberg, Jane. *Resurrection of Mary Magdalene: The Legends, Apocrypha, and the Christian Testament*. New York, 2002. Drawing on canonical and extra-biblical literature, this feminist study approaches its subject through an analysis of legend, archaeology, and Gnostic traditions, employing Virginia Woolf's insights into structures of domination and communality.

DIANE TREACY-COLE (2005)

MASCULINE SACRALITY is the designation of some domain of the supernatural universe as masculine. It is a feature of numerous religious systems in human societies around the world. A comparison of such systems reveals three levels of expression for the masculine valuation of the sacred.

At one level, certain natural symbols recur in religious systems in the form of hierophanies or sacred manifestations of masculine higher being. These natural symbols include sky, peaks and mountains, thunder, rain, and certain horned beasts, as well as such creatures of flight as eagles. At a second level of expression, religious systems often attribute certain cosmic functions to masculine metaphysical entities and/or specifically male supernatural beings. Thus gods as opposed to goddesses tend to be credited with such cosmic functions as creation of the mundane universe, establishment of the moral code, invention of the elements of mortal subsistence, and the like. Finally, in many religious systems there is a belief in the masculine orientation of certain sacred values. These commonly include order, stability, permanence, and essentiality. This level of religious expression may be basic to the social ethic and organization of a community, and may furnish it with a model and sanction for the pursuit of distinctive life patterns on the part of men and women.

A masculine being or entity of a particular system may have reality at more than one of these levels of expression and possibly at all three simultaneously. A brief illustration may be furnished by Indra, one of the highest gods in the Vedic religion of ancient India. An atmospheric divinity, he is credited with the unleashing of rain and storms, expressive of the masculine fecundating force. In general, Indra personifies cosmic vitality: he fertilizes the earth and makes rivers, sap, and blood alike to circulate; his retinue is the winds. He is also sagacious and deceptive, given to fooling his adversaries

by changing his form. Finally, the power of Indra is sovereign: he is the chief of the heavenly council of gods, and in iconography he usually wears a crown.

As a figure of the Vedic religious universe, Indra exemplifies a particular set of conceptions about the masculine nature of the sacred. These are realized at the three levels of expression discussed above. At the level of natural symbols Indra is represented by lightning, his cosmic projectiles, and by the rainbow, whereby he dispatches those projectiles. At the level of cosmic functions, Indra is associated with fecundation and life-giving force. Finally, at the level of religious values, Indra has the meaning of sovereignty: he is the prototype of the ruler. He exemplifies the values pertaining to the proper relationship of ruler and ruled, for he is lauded and invoked more than any other deity in the oldest of Indian sacred texts, the *R̥gveda*. As a secondary value, Indra represents a force of mystery and delusion, since he is a cosmic magician, able to generate new aspects and shapes at will.

From Indra's example it should be apparent that the levels at which masculine sacrality is expressed in religious systems frequently interrelate. It is difficult to discuss natural symbols, cosmic functions, and religious values of the masculine in isolation from one another. Nevertheless, these levels of expression should be borne in mind in the following discussion of the basic attributes of masculine sacred being.

PRIMORDIALITY. In religious systems, a form of higher being anterior to and/or prerequisite to other varieties of being tends to be masculine. Thus if differentiated forms of being are said to arise from some primordial undifferentiated entity, the latter is frequently masculine. The Arapaho of North America, for instance, believe in a supreme god out of whom the entire manifest world originated. Their name for him is Spider, presumably because the spider weaves his web out of himself.

Alternatively, the being that first dwells in or emerges from the undifferentiated cosmic mass tends to be masculine. In world mythologies, masculine first beings are abundant. The supreme god of the Flathead of North America is Amotken ("the old one"). Similarly, the supreme god of the Yahgan of Tierra del Fuego is Watauniewa ("the old, eternal, unchangeable one"). Among the Hawaiians, the supreme male divinity is the god who dwells primordially, at the dawn of sacred time, in Pō, the world of obscurity or darkness. Again, for the inhabitants of the Gilbert Islands, the earliest being in the primordial void is a male divinity, Na Areau the Elder. In Australian religions, during the primordial time called the Dreaming, over the earth roamed the first beings called Great Men, who are fathers to the creatures of the present world.

In mythology, feminine being tends to be secondary to masculine being. Thus, in the Navajo creation myth, First Man is paired with First Woman; both of them emerged from the union of primordial mists, but the emergence of First Woman follows that of First Man. In general, where there occur masculine and feminine forms of primordial

being, the former tends to provide precedent for the latter: Eve emerges out of the body of Adam, not Adam out of Eve.

HEIGHT. Religious systems widely associate with masculine sacrality the attribute of height, as well as the corollaries of ascendancy and transcendence. Mircea Eliade points out in *Patterns in Comparative Religion* (1958) that belief in the celestuality of the divine being is nearly universal in religious systems. To this it may be no less validly appended that the highest entities and beings of religion and mythology overwhelmingly tend to be masculine. Moreover, the sky is the most fundamental of all natural symbols of masculine sacrality.

In cosmology, sky beings are preponderantly male as opposed to female. Io, meaning "raised up" or "on high," is the supreme god of the Maori, while the Yoruba of Africa call upon a god named Ọlọrun, "owner of the sky." In mythology, masculine first beings not infrequently represent sky divinities: Amotken, the previously mentioned first being of the Flathead, is also a celestial god, living in the crown of the cosmic tree.

In some mythologies, high gods originate elsewhere than in heaven, but journey there before the onset of profane time. This theme is particularly well attested in Australia. Bunjil, the god of the Wotjobaluk, for instance, lived on earth as a Great Man but later went to the sky. Among the Aranda, some earthborn first beings fell slumbering to the ground and reemerged into it, while others climbed sacred passages to the sky. The former are identified with totemic ancestors, the latter with high divinity—the sun, moon, and stars.

Because the nearly universal attribute of masculine sacrality is height—often expressed symbolically in terms of celestuality—the idea of access to godhood tends to be expressed through the imagery of ascent or, occasionally, of descent. In the Tantric tradition of southern Asia (India, Nepal, Tibet), the sublime is taken to be masculine; integration with it demands a technique of focusing and directing upward the feminine energies of the physiological microcosmos. In popular Hinduism, on the other hand, humans are said to approach the sublime at the god's instance, by his willful descent to the mundane world on a series of occasions called *avatāra*. Thus a popular myth cycle portrays the high god Viṣṇu mercifully descending upon earth to be born in a series of mortal forms: as a fish, as a boar, as King Rāma, as the rambunctious cowherd Kṛṣṇa, and so on. By contrast, while a mother goddess occurs in popular Hinduism and at times manifests herself on earth, she is not specifically credited with the capacity of *avatāra*, or divine descent.

As an attribute of masculine sacrality, height is fundamentally but not exclusively symbolized by sky and atmosphere. Height may also find expression in the symbolism of entities associated with loftiness. Sacred mountains are often the dwelling places of gods: the mythical Mount Meru of India and the Greek Olympus are well-known examples, as

are certain peaks in Japan and other parts of the world. In some religious systems, height as an attribute of masculine sacrality finds expression in the natural symbolism of sky-dwelling creatures. Fabulous birds, especially eagles, tend to be associated with godhood. The Bella Coola of the northwestern coast of America, for instance, believe in an *axis mundi*, or sacred pole connecting heaven and earth, that was erected by the highest god; it is topped by a seated eagle. Elsewhere in the religions of North America, and in parts of Siberia as well, an important position is held by a mythical creature of eagle-like appearance, the Thunderbird. The Thunderbird's association with the awesome and fecundating masculine force of the sky is underscored by the fact that he is said to cause wind and thunder by flapping his wings, and lightning by opening and closing his eyes.

EFFULGENCE. Along with loftiness and sublimity, effulgence is a common attribute of masculine sacrality suggested by the natural symbolism of the sky. Various religious systems characterize the supreme god as white or shining. The Khanty and the Mansi of the Asian Arctic, for instance, describe their supreme god Num-Türem as luminous, golden, and white. One of the most powerful gods of Hinduism—dwelling, incidentally, on mountains—is Śiva, the “shining one.” Devotional literature sometimes refers to him as “the lord white as jasmine.” In Hawaiian mythology, at the dawn of sacred time the first light in the universe was that of the original being and high god. Navajo mythology has it that First Man and First Woman arose in unparalleled radiance from the primordial mists of the sky, the former in the place of sunrise and the latter in the place of sunset. While each burned a fire to light the firmament, the light of First Man's fire was stronger.

In cultic practices, sacred objects associated with masculine divinities tend to be chosen for whiteness or luminosity. This is true, for instance, of the crystal stones used in some Australian rituals. (The supreme god Baiame of certain southeastern Australian tribes sits on a crystal throne.) Similarly, the First Man of Navajo legend burned crystal for his fire and was accompanied at his birth by white corn.

Fire, of course, is a common accompaniment to religious ritual. In Vedic India, not only was fire itself a god, but it served as the purifier and sacred conveyance of sacrificial oblations to the high gods in heaven.

PERVASIVENESS. The attribute of being immanent in the universe is widely associated with masculine sacred being. It is not without significance that the name of the Hindu god associated with *avatāra* or divine descent, Viṣṇu, means “pervader.” However, in relation to the concept of supreme godhood, the attribute of pervasiveness should be carefully qualified because sky gods, those quintessential exemplifications of masculine sacrality, are typically characterized as distant, remote, and inactive.

Accordingly, in many religious systems no special cult centers on the high being of the heavens. He may be left out of ritual and worship altogether, or be called upon only in

times of extraordinary crisis. Many mythologies speak of the sky god as having once been actively engaged in cosmic business, but as having withdrawn from direct intervention in the universe for all time.

As *deus otiosus*, or retired divinity, the sky god nevertheless often remains in touch with mundane affairs and manifests his presence indirectly. A particularly widely held belief is that thunder is a manifestation of such a god. For instance, people of the Andaman Islands believe that thunder is the voice of their supreme god Puluga, and the Kansa Indians similarly maintain that thunder is the voice of their high god Wakantanka, whom they have never seen. Conceived of as a masculine epiphany, the growling sound of thunder may be imitated in ritual to invoke the presence of the sublime. In Australian ritual one of the most sacred objects is the bull-roarer, a piece of wood with a string tied through a hole in one end. When swung around, this object makes a growling sound suggestive of a bull's bellowing or of thunder; it is particularly used in boys' initiation rites. Similarly, in religious rituals, particularly male initiation ceremonies, of the North American Southwest, an instrument called a bull-roarer or whiner is used to invoke and evoke the presence of the high god.

As a variant on the treatment of thunder as a masculine epiphany, the growling force of volcanoes is occasionally regarded as a sign of the immanence of sacred masculine being. In South America, for instance, the Puruhá tribesmen of La Montaña occasionally sacrificed humans to a volcanic mountain inhabited by a god who made his presence felt from time to time.

Another way in which the high god, as *deus otiosus*, maintains an immanent presence in the affairs of the universe is by delegating authority to lesser supernaturals. The high god is often credited with initiating creation, but not always with completing it. In many mythologies the completion of the work is delegated to other figures of the high god's designation. For instance, the supreme god Gicelamu'kaong of the Delaware delegates creation to the sun, the moon, the thunder gods, the four winds, the earth mother, and the master of animals. It is common in mythology for the *deus otiosus* to withdraw, leaving his own son behind to carry on his cosmic activities. One of the many instances of this is found in the creation myth of the Gilbert Islands, where the divine protagonist Na Areau the Younger inherits the task of creation from his progenitor, Na Areau the Elder, the primordial being.

As son and successor to the high god, a secondary celestial may acquire considerable preeminence over the original high divinity. This preeminence is graphically symbolized in some belief systems by treating the high god's offspring and successor as a solar deity. Thus among the Tiv of Africa, the sun is the male child of the supreme being Awondo. Similarly, among the Wiradjuri and the Kamilaroi of southeastern Australia, the sun is the creator god's son.

In many mythologies, a type of supernatural who mediates between a withdrawn cosmic father figure and the mundane sphere is called the culture hero. A culture hero is usually portrayed as being with the high god in primordial times, and his sacred activities are sometimes performed at the high god's instance. As a stand-in for higher divinity, the culture hero may play a role in mythology that is more important than that of the high god. Culture heroes are sometimes represented anthropomorphically, but just as frequently the culture hero has a theriomorphic representation: as a coyote among some southwestern North American peoples, and as a great hare on the eastern North American coast; as a wolf or a raven in eastern Siberia; as a bat among the Paresí of Bolivia; and as a tapir in the Amazon Basin. Whatever his representation, the culture hero invariably serves to keep terrestrial society in touch with godhood, and almost without exception is portrayed as a male.

The activities of the culture hero are varied. In some mythologies he assists in the work of creation. This holds of the earth diver, a culture hero widely revered in North America who, at the instance of the high god, brings up the first land from the primal waters. Another typical task of the culture hero is to provide the elements of culture and/or the basic tools of subsistence to the ancestors of modern men. Among the Northwest Coast people and in eastern Siberia, for instance, the culture hero Raven brings light and various elements of culture to the mundane world in primordial time.

Acting as he does as a kind of rival to the ethically sublime high god, the culture hero is often portrayed as a schemer or trickster. He may assist men at the expense of higher being, as, for example, by stealing water, sun, or subsistence materials from the other world or by releasing game enclosed in a cave or other place inaccessible to humans. This aspect of the culture hero's character is exemplified by the fire-giver Prometheus of Greek mythology.

Culture heroes are also frequently portrayed as sacred ancestors of human descent groups. In the case of theriomorphic culture heroes, such beliefs may find expression through totemistic cults like those common in Australia and North America. More generally, religious systems commonly embody a belief that sacred substance, as an immanent component and inheritance of human individuals, is masculine—that is, it is derived from a high god, is transmitted by supernatural males acting in sacred time as ancestors of men, and is passed along in profane time through the male descent line. Thus, according to Hindu social theory and law, men alone pass the sacred substance of their lineage to their descendants, whereas the sacred substance inherited by a woman is not immutable, being transformed to correspond to that of her husband at the time of marriage. According to Hindu doctrine, then, women transmit to their offspring no sacred substance of their own but only that of their husbands.

Finally, regarding pervasiveness, it should be mentioned that the natural symbolism of the sky overlaying and embracing the supine earth powerfully suggests the immanence of the masculine sacred principle. A sexual dichotomy is commonly featured in religious systems, the sky being associated with the masculine and the earth with the feminine. Earth goddesses are not infrequently paired with sky gods. Moreover, earth and sky together constitute the prototype of the cosmic pair. A common theme in world mythologies is that of the primordial separation of the mutually embracing sky and earth. The creatures responsible for forcing sky and earth apart are variously represented as culture heroes, ancestors of the present earth dwellers, and/or the divine offspring of sky and earth themselves.

Contact between the separated celestial and terrestrial realms is frequently achieved in sacred time (and, by that precedent, is renewable in present, profane time) by means of certain sacred paraphernalia or entities of a fairly obvious sexual symbolism. Apertures in rocks or clouds are commonly portrayed as sacred means of passage, as are fabulous pillars, trees, ladders, mountains, and the like. In other words, Sky the father and Earth the mother are mediated by sacred holes and poles. These devices, moreover, contrast somewhat in their orientation: the sacred holes tend to be earth-directed, and the sacred poles sky-directed. Thus in the creation myth of the Gilbert Islanders the culture hero Na Areau the Younger walks in sacred time upon the rocklike upper surface of the sky, then pokes a hole down through it to apprehend the earth. From the bowels of the earth Na Areau then enlists an eel that braces himself against the earth with his tail in order to lift the sky upward by his snout. Thus the once direct contact between earth and sky comes to be mediated by the phallic force of that cosmic uplifter, the divine eel.

The performance of rituals for reestablishing primordial contact between the mundane world and the sublime is fairly common in religious systems. Such rituals tend to embody the symbolism of ascent, and the implements used in them are often of a phallic appearance. Thus to symbolize the *axis mundi*—the sacred connector of heaven and earth—a pole, ladder, or tree is often used; it may be ascended by a ritual specialist, who thereby symbolically journeys to heaven on behalf of his community. Such ascent rituals are typically performed in Siberia and other areas of the world by shamans, ritual specialists in techniques of healing and ecstasy.

FECUNDITY. Masculine sacred being is widely associated with generative and fecundating powers. This association seems to be based on the natural functioning of the sky, which fecundates the receptive earth by precipitation. One ritual of ancient India gives explicit expression to the association: the *Bṛhadāraṇyaka Upaniṣad* enjoins the husband to unite with the wife after uttering the formula, "I am the heavens, thou, the earth."

High gods and important male supernaturals tend to be credited with extraordinary potency and sexual capacity. These capabilities may be seen as independent of and addi-

tional to any role played by a given divinity in the creation of the cosmos. In popular Hinduism, for instance, the high god Śiva shakes the cosmos by the force of his copulation. A symbol of Śiva is the lingam, a stylized phallus usually given concrete realization in black stone.

In natural symbology, the masculine attribute of fecundity is often expressed by animals of high fertility. Bulls are a particularly common symbol. Śiva's cosmic vehicle is a fabulous bull, and the bull is also the form assumed by Zeus in the early Greek myth of Europa's ravishment.

As a symbol of the masculine, the bull tends to be cross-linked with the symbolism of thunderbolts. The latter are sometimes represented in the shape of stylized horns. Also, the bull's bellowing, like thunder, is an epiphany of godhood. Thus in the ancient Near East, the god Min had the epithet Great Bull, lightning was one of his attributes, and he was responsible for rain and for giving life. In Papua New Guinea, the culture hero Sosom is aurally evoked by the bull-roarer, which is his voice; his body is of stone, and he has an exaggerated penis, suggesting his sexual and fertile powers. Indeed, Sosom is credited with fertilizing man as well as soil.

ACCULTURATION. Man's conception of order as a sacred force plausibly derives from observation of the events and entities of the heavens. Within the sky, which is itself unchanging and stable, celestial bodies move about according to a placid and unvarying rhythm. Because the sky is associated with the masculine, masculine sacrality comes to be seen more or less universally as the principle of permanence and order.

Thus, in mythology, the establishment of things that give permanence and stability to existence—rule, law, and the structured bases of things and institutions—tends to be treated as a masculine function. High gods and culture heroes delineate the features of the primordial landscape. They separate land from water and establish landmarks in the cosmos: sacred mountains, boulders, trees, rivers, and the like. Moreover, male supernaturals furnish society with the permanent institutions of culture, including law, moral code, and the forms of religious practice itself. At the same time, high culture tends to be perceived in religious communities as a domain proper to men. This is particularly true in regard to religion. Virtually without exception, human societies exclude women from the most sacred religious rites, as well as from manipulation of the most sacred objects of cult.

Where sacred values are associated with a dichotomy of gender, the usual tendency is for the masculine to be associated with stability and essentiality, and the feminine with change and materiality. The masculine may be identified with being's inner form—thought or structure—while the feminine is identified with being's outer forms—word or substance. The masculine may be associated with the potential, inactive form of being; the feminine, with kinetic, active being. The masculine is one and/or integrated; the feminine is plural and/or diffuse.

Thus in the Yoga and Sāṃkhya religious philosophies of India, the universe is said to be based on a polarity of two metaphysical principles. The masculine principle, *puruṣa* (which itself means "male" or "man"), is that of immanent and essential being, whose nature is immutable. By contrast, the feminine principle is associated with *śakti*, the energy that activates the ever-changing material universe. In the philosophical writings of the tradition, the masculine deprived of its *śakti* is compared to a lifeless god, while the feminine principle out of balance with the masculine is said to be rampant, capricious, and dangerous.

Navajo religion likewise associates dichotomies of cosmic function and religious value with the sacred masculine and feminine. In mythology the primordial being, First Man, creates a son and a daughter who are respectively Thought and Speech. The latter is called the outer form of Thought, and the former, the inner form of Speech; both are necessary for the creation of the inner forms of the present universe. As first boy and first girl, these entities are also said to have produced a daughter, a feminine deity identified with the earth. Her name, not insignificantly, is Changing Woman.

Gender dichotomies expressed in Navajo mythology are reflected with great consistency in the cultural and social patterns of the community. In *Language and Art in the Navajo Universe* (Ann Arbor, 1977), Gary Witherspoon points out that the Navajo associate the ritual and ceremonial domain with thought and the masculine. Thus most ceremonial practitioners are men. The ceremonies they conduct, moreover, are rigidly structured and must be performed without mistakes or modifications. Usually, Navajo ceremonies are concerned with restoring prior states of being. The fact that such ceremonies are the domain of men bespeaks a religious view that masculinity has to do with the origins of things and their culmination.

On the other hand, Navajo women are active in productive and domestic matters. They head most domestic groups and control land and sheep on behalf of those groups. This life pattern is consistent with the religious view of the feminine as the domain of growth, process, and change. For the Navajo, social and economic life concerns the generation of new conditions and new beings; it is characterized by movement, change, activity, and productivity. Here, then, it is appropriate that women dominate.

SUMMARY. Belief in a masculine domain of the sacred universe is common in religious systems and tends to be associated with recurrent natural symbols, cosmic functions, and religious values. Based on the patterns discussed above, the following can be enumerated as more or less universal tendencies. (1) Primordial first beings of cult and/or mythology are most often male or masculine. (2) Cosmic functions pertaining to creation and fecundation are usually associated with masculine—as opposed to feminine—entities, principles, and beings. (3) Elements of culture tend to be associated with or attributed to masculine—as opposed to femi-

nine—principles and/or supernaturals. (4) In community life, important differences in life patterns between the sexes have sanction and justification in beliefs about gender sacrality. In particular, manipulation of sacred objects and ceremonies tends to be seen as the appropriate domain of men. (5) The most exalted beings and entities of the masculine sacred universe are almost always associated with the natural symbolism of the sky and derive their attributes accordingly.

BIBLIOGRAPHY

There is no single reference work devoted to the topic of masculine sacrality, though many pertinent sources are available. Concerning male supernaturals, a worthwhile and concise, if dated, treatment is Wilhelm Schmidt's "The Nature, Attributes and Worship of the Primitive High God." It appears in a volume edited by William Lessa and Evon Vogt, *Reader in Comparative Religion*, 4th ed. (New York, 1979). The standard reference work on comparative religions by Mircea Eliade, *Patterns in Comparative Religion* (London, 1958), contains much useful material on masculine sacrality.

Also worth citing are a number of studies on religious systems in particular world areas. For material on Australian systems, see Eliade's *Australian Religions* (Ithaca, N.Y., 1973). Some pertinent material on Papua New Guinea is found in Roy Wagner's *Habu* (Chicago, 1972). For a wealth of material on religious systems of the Western Hemisphere (and some references to northeastern Asia), see the valuable survey by Åke Hultkrantz, *The Religions of the American Indians* (Los Angeles, 1979). For Hawaiian and related Polynesian religions a standard source is Martha Warren Beckwith's *Hawaiian Mythology* (1940; Honolulu, 1970). A legend of the Gilbert Islanders that speaks for itself in the richness of its gender symbolism is reproduced by Arthur Grimble in "A Gilbertese Creation Myth," included in the Lessa and Vogt collection mentioned above.

On religious traditions of India and southern Asia there is a profusion of material related to masculine sacrality, among which several studies may be particularly recommended. Heinrich Zimmer provides a very accessible treatment on Indian sacrality in general, including much information on masculine sacrality, in *Myths and Symbols in Indian Art and Civilization*, edited by Joseph Campbell (1946; Princeton, 1972). Zimmer's *Philosophies of India*, also edited by Campbell (1951; Princeton, 1969), offers in its chapter "Sāṅkhya and Yoga" a penetrating discussion of the relationship of gender sacrality to the philosophical traditions of India. As a detailed account of sexual technique and symbolism in relation to metaphysics and philosophy within a single religious tradition, no study supersedes Mircea Eliade's classic *Yoga: Immortality and Freedom*, 2d ed. (Princeton, 1969). A stimulating treatment of masculinity and the sacred in Nepalese and Tibetan religious traditions is furnished by Robert A. Paul in *The Tibetan Symbolic World: Psychoanalytic Explorations* (Chicago, 1982). The joint monograph *Women in India: Two Perspec-*

tives by Susan S. Wadley and Doranne Jacobson (Columbia, Mo., 1977) contains in Wadley's essay one of the best concise treatments available of *śakti* and its relationship to the Indian conception of the masculine and feminine sacred worlds.

Lastly, for a general anthropological perspective on the relationship of gender sacrality to social ethnic and male/female life patterns, consult Sherry Ortner's "Is Female to Male as Nature Is to Culture?" in the collection *Woman, Culture, and Society*, edited by Michelle Rosaldo and Louise Lamphere (Stanford, Calif., 1974).

Revised Bibliography

MASHTOTS', MESROP (c. 345–440), inventor of the Armenian alphabet and saint of the Armenian church. The major source for his biography is the *Life of Mashtots'* written by his pupil and associate, Koriwn. The name *Mesrop*, the etymology of which is still unknown, does not appear in the works of Armenian writers until after the fifth century.

Mashtots' was born to a peasant named Vardan in the village of Hats'ekats', in the district of Tarōn (present-day Muş, Turkey). He was educated in Greek letters as a youth. As a young man he entered military service, becoming a clerk in the royal army stationed at Vagarshapat (present-day Echmiadzin). Led to solitary life by his interest in the scriptures, Mashtots' became an anchorite. He evidently headed a *kelion* (a small group of anchorites) in the 390s. While proselytizing the people of the district of Gogh't'n (Nakhichevan, Azerbaijan), he conceived the idea of inventing an alphabet for the Armenian language and making the scriptures available to the common people. After deliberating with Bishop Sahak of Armenia and King Vram-shapuh of Persarmenia,

he learned that a certain Syriac bishop by the name of Daniel had in his possession an alphabet for Armenian, which was immediately solicited. Finding Daniel's alphabet unsuited to the phonetic structure of Armenian, Mashtots' and his pupils set out for Edessa to do research, and there in 404 Mashtots' himself invented an alphabet consisting of thirty-six letters.

Returning to Armenia, Mashtots' founded schools and continued the task of translating the scriptures that he had begun in Edessa. He devoted the rest of his life to literary, educational, and missionary works. At first his activities were concentrated in the southeastern and eastern parts of historical Armenia (i.e., Armenia Magna). He preached in Goght'n and then in Siwnik', where he founded schools and established an episcopal see. Subsequently, he went to Georgia, where he invented a script for Georgian and preached the teachings of the Christian church. His concern for the Armenians on the Byzantine side of the border led him in the 420s to Constantinople, where he met the emperor Theodosius and the patriarch Atticus. Having received from them the necessary permission for carrying out cultural work, he returned to Byzantine Armenia, where he established schools and introduced the new script. During his stay there he persecuted an obscure sect known as the Barbarianos and invented a script for Albanian.

After his return to Persarmenia, Mashtots' went to preach in Caucasian Albania (corresponding to parts of present-day Azerbaijan and Dagestan). He then visited those districts of historical Armenia that had been annexed to Georgia and Albania in 363. An important contribution of Mashtots' was to unify the Armenians of these districts through linguistic bonds.

Mashtots' spent the final two decades of his life in Armenia devoting himself to writing homilies and letters, none of which has survived. Some scholars identify Mashtots' with the chorepiscopus Mastoubios of Armenia. Mashtots' died on February 17, 440 and was buried in the village of Oshakan. A martyrrium was built over his grave and he was venerated as a saint. The Armenian people consider him the father of the Armenian literary tradition and the creator of the Armenian national identity. His grave is still a major site of pilgrimage.

KRIKOR H. MAKSODIAN (1987)

MASKS. This article will not attempt to establish a comprehensive inventory of masks and their various ritual uses because even larger works have only been able to do this imperfectly. Rather, as a general introduction to this field, it will concentrate on some of the general concepts and theories that have arisen from the study of masks. Its geographical focus will be Africa, Melanesia, and the Americas because these regions provided the data on which the theories discussed were based.

HISTORICAL OVERVIEW. Although the importance of descriptions by travelers, missionaries, and topographers from at least as early as the sixteenth century should not be overlooked, it can be argued that effective study of ritual masks began only in the nineteenth century. At this time the first interpretations and general theories about European folk traditions emerged, following (among others) the work of the Grimm brothers, Jacob Grimm (1785–1863) and Wilhelm Grimm (1786–1859), for whom folktales revealed traces of beliefs and myths connected with ancient pagan gods. Later, Wilhelm Mannhardt (1831–1880) took an interest in the folk religion of his time, in particular that of the rural communities. Collecting vast amounts of data, Mannhardt underscored the predominance of beliefs in fertility spirits and in the existence of a connection between vegetal and human life. Under his influence, a number of mask rituals came to be understood as incorporating ancient beliefs dealing with fertility, and masks were interpreted as representing demons of the vegetal world.

At the same time, E. B. Tylor (1832–1917) began to establish anthropology as a science of human beings and their culture. He described the evolution of civilization from the first humans, who in his eyes were in large part represented by contemporary "primitive" peoples, up to the civilized human of his day. To this end he used a comparative method to organize an impressive number of facts and documents in support of his evolutionary perspective. He also analyzed the process whereby elements belonging to an older stage of evolution survive into later stages in which they do not function adequately.

Therefore, the various elements that formed the core of the study of masks by folklorists as well as anthropologists up to World War II were present as early as the last quarter of the nineteenth century. These elements are: (1) the evolutionist perspective, following which the history of Western society can be reconstructed by classifying all known societies according to the degree of civilization they have reached; from this point of view, the peoples studied by ethnology enabled modern humans to relive, as it were, stages experienced by the Western world thousands of years ago; (2) the notion of "survival," used to describe those remnants of ancient customs that resisted evolution and survived beyond the period in which they were truly meaningful; and (3) intensive use of the comparative method—on the basis of what ethnology reported on traditional communities of Africa, Oceania, or the Americas, it was thought possible to reconstruct the earli-

er stages in the evolution of a society and to recover the original meaning of a particular custom.

By the end of the nineteenth century, scholars were in possession of an ever-increasing amount of comparative data on masks. In 1883 Adolf Bastian wrote a general study on the role of masks. In 1886 Richard Andree published an overview and summary of far-ranging documents from various periods. He thus made a large database on masks available to other scholars while organizing it into categories that have been constantly taken up ever since. Finally, in 1898 Leo Frobenius linked masks, seen as representing spirits of the dead, to secret societies. From his perspective this relationship originated as a male reaction to matriarchy and provided an explanation for the exclusion of women from practically all mask rituals. These early theories of ritual masks marked the anthropological and folkloric study of masks for several decades.

In a well-known article published in 1933, Karl Meuli formulated a general theory of “primitive” masks that he then applied to European traditions. According to him, there is a close connection between masks and so-called matriarchal societies. Furthermore, the majority of primitive masks represent spirits, primarily spirits of the dead. Indeed, the strange appearance of masked figures indicates that they do not belong to the human realm. Their behavior reinforces this interpretation: the masks beg while threatening, they reprimand, and they punish, after which they distribute gifts and grant wishes of prosperity and then disappear. Meuli explains this behavior as the result of a primitive belief that no death is natural, every death being the result of the malevolence of a living person. At particular times during the transition from an end to a beginning (the passage from one year to the next, for example), the underworld opens up, allowing the dead to return among the living. The masked figures represent these dead, who first seek revenge. By letting them pilfer and chastise as they please, one gives them the opportunity to calm down, after which they again bestow benevolence.

This interpretation, applicable equally to the masks described by ethnology and to European folk masks, is a synthesis of the theories founded on evolutionism, the notion of survival, and the comparative method, to which it adds psychoanalysis. Influential both within and outside scholarly circles, Meuli’s theory played an important role in the history of the study of masks. It appeared, however, at a time when anthropology itself was gradually turning away from the ambitious theories developed at the beginning of the century to focus instead on elaborate and detailed localized research, employing a more demanding method. A similar trend emerged somewhat later, after World War II, in the study of folk traditions.

Up until then, because of the survival theory, a given culture was not studied as a coherent contemporary phenomenon but rather as a patchwork of various elements that could be analyzed somewhat independently of each other. Critics noted, however, that a custom should not be consid-

ered as a mere relic: it survived because it still had a role to play in the society in which it was observed. From then on studies increasingly tended to consider each custom as part of a contemporary system, analysis of which would illuminate the function of each of its components. Similarly, comparison was no longer applied to isolated elements; rather, scholars compared systems of relationships. Finally, the problem of the continuity of culture and cultural traits was tackled on a new basis: the historic dimension was reintroduced into the analysis and replaced the notion of survival, which focused interest on the question of origins and, in effect, canceled out history.

For instance, earlier authors had interpreted Carnival as either an old agrarian rite of purification and fertility aiming at driving out the bad spirits of winter or as a survival of the Roman Saturnalia. However, as Suzanne Chappaz-Wirthner (1995) points out, integrating history into the study of Carnival reveals that the imagery linked to secular and religious power, as manifest in court festivals and liturgical celebrations, played a decisive role in the development of a repertoire of carnivalesque images unique to the Christian West; individuals as well as social groups resort to it to play out their conflicts and express their aspirations. Carnival therefore can be considered a language with cosmic resonance enabling a dramatization of social dynamics.

The traditional populations studied by ethnology were again placed in the historical framework that general theories considering them as “primitive” had somewhat obscured. Thus, anthropologists and art historians as well as folklorists came to carry on their research within concrete historical frameworks. They now deal with notions of identity, creativity, change, exchange, power, and politics among other elements that shape a particular mask ritual at a particular time.

PROBLEMS OF DEFINITION. Although everybody seems certain of what a mask is, the definition of the term poses important problems. In the narrow and usual sense of the word, a *mask* is a false face behind which one hides one’s own face for purposes of disguise. In ethnology, mask also refers to headpieces that do not cover the face, as well as elements of costumes that are worn over the face (such as veils, fringes) and other full or partial adornments of the body or face. The term *mask* is also used to refer to any representation of a face, whether or not it is worn on the face of a dancer. Consequently this includes mannequins; effigies; faces painted, molded, or carved on buildings and boats; and pendant masks as well as finger or pocket masks. Finally, the definition is sometimes widened to include face or body paintings and tattoos. Since scholars do not agree on the denotation of the term, confusion permeates the literature on the subject. As M. C. Jedrej (1980) puts it, the word “mask” identifies no coherent class of institutions of any use to social anthropologists.

It is important to keep in mind this problem of definition when trying to understand some of the ideas frequently advanced on the subject of masks; for example, the claim for

universality of the mask: it is only when makeup, paintings, and tattoos are included in the definition of mask that one can say that masks can be found in virtually all cultures. But is such a broad definition justified? No one can say, for this question has not yet been systematically investigated.

It is important to note that the focus on the face that museums, art galleries, and books on masks often maintain gives a distorted view of the ritual mask. This interest in the face has encouraged a tendency to relegate to the background the many masks that, lacking a face, are simple hoods or fringes of fibers or beads falling in front of the face of the wearer. Fascination with the face has also tended to minimize interest in the costume of the mask, which has often been hastily dismissed either as fundamentally designed to conceal the wearer or as merely accompanying the mask. The mask must, however, be considered from a larger perspective so as to include the costume, the headdress, and the possible accessories, as well as immaterial factors such as the behavior, the dance steps, and the songs or texts pertaining to the mask. As Eberhard Fischer (1980) points out, among the Dan of Liberia and the Ivory Coast it is the headdress, and not the face, that immediately signals a mask's type. Consequently, the first step in the transformation of a mask from one category to another is the alteration of the headdress. The Dan also have "night masks," which comprise no tangible face but may include feathered headdresses. In ancient Egypt the priests' masks were adorned only with animal heads. The priests playing the roles of anthropomorphic deities did not require masks: the headdresses and the specific emblems of the gods were enough to identify them.

The face, therefore, is not necessarily the place where the meaning of the mask is concentrated. It follows that, when faced with an ensemble that includes all the elements of a mask (costume, headdress, dance), it is rather difficult to decide that there is no mask simply because the face of the dancer is painted rather than covered with a hood or false face. In any case, some scholars see a continuity between face paintings and masks because of the similarities between the two phenomena: both are temporary adornments, both appear on special occasions (initiation, marriage, death, or the lifting of a prohibition), and both seem to have comparable functions. On the other hand, the inclusion of tattoos in the definition of masks creates more problems than it resolves, for it is difficult to see how masks and paintings, which are temporary, could simply be classified with tattoos, which are permanent.

THE GEOGRAPHY OF RITUAL MASKS. A narrower definition of masks—one that takes as a fundamental criterion the existence of one element of costume (false face, hood) worn in front of the face—forces the realization that even in regions that are traditionally considered the privileged domains of masks there exist extensive zones in which masks are not used. In Africa, for instance, masks are found mostly along a strip that cuts across the center of the continent from west to east and curves toward the south. In the Americas, inten-

sive use of masks is most frequent in the western heights of both North and South America. Finally, in Oceania the mask is practically absent from Polynesia. It is extremely widespread in Melanesia, although it is not used among most of the highland peoples of New Guinea, in the main part of Irian Jaya and in eastern Papua New Guinea, in parts of the Bismark Archipelago, in the central and Southeast Solomons and the Santa Cruz group, and in the Fiji group.

Several hypotheses have been put forward to explain the gaps in the distribution of masks. According to one, peoples without masks simply lack the wish to express themselves plastically and use other means to formulate and express their beliefs. Besides being an example of circular reasoning, this explanation runs against a number of exceptions that it cannot explain, particularly among peoples that have a statuary but no masks. The absence of masks in certain regions of Africa has also been attributed to the influence of Islam. However, anthropologists have demonstrated that the Islamicization of a given region did not necessarily lead to the elimination of the art of masks. On the contrary, as René Bravmann (1977) showed, some African societies created new masks after the advent of Islam in order to represent the *jinn*. Masks have also been said to be more characteristic of agricultural peoples. This hypothesis, however, accounts only imperfectly for the presence of masks among hunters in Asia and the Americas. The most successful general theory has been that of the historical cultural school, which explained the distribution of masks by arguing for their relationship with so-called matriarchal societies. An examination of the available data has, however, discredited this hypothesis as well. To date no global model is available to explain the geographic distribution of masks.

As a matter of fact, since being forced to abandon the broad theories of the nineteenth century and beginning of the twentieth century, scholars have no longer shown much interest for the study of questions of this amplitude. Most have focused instead on the in-depth analysis of a particular society, avoiding any far-reaching comparative evaluation they consider responsible in part for those past mistakes.

Nevertheless, some interesting localized studies have attempted to specify the status of masks within certain populations. Some try to elucidate the relationship that may exist in particular societies between the mask and other religious and sociopolitical structures. Others look for the provenance of the masks of particular groups or even attempt to reconstruct its history. For instance, Jean Guiart (1966) showed that, in certain parts of New Caledonia, the development of the art of masks seems to have been linked to the development of chieftainships in the same region. And according to William Siegmann (1980), the use or nonuse of masks to manifest spiritual forces in West Africa seems directly related to the dominant features of social organization in particular areas, and especially to the role of lineages and political structures. But still lacking is a general model that explains the distribution of ritual masks, an extremely important element of this institution.

THE DATING OF MASKS. How far back can one trace the appearance of the ritual mask? Many scholars do not hesitate to go as far back as the Early Stone Age, but this raises a number of problems. The documents on which they base their conclusions are far from clear and admit of various interpretations. A workable example is that of the well-known “Sorcerer” of Les Trois Frères cave (Ariège, France, middle Magdalenian Age; c. 12,000 BCE). It is often presented as the oldest representation of a masked human, whereas paleontologists now prefer to see in it the portrayal of a mythical mixed being (half man and half beast). Such a figure may or may not be linked to the existence of masks; it may or may not constitute the inception or consequence of mask use. In any case, one cannot be categorical about it. This is true as well for an important number of the documents that have been interpreted as representing masked beings because they showed anthropomorphic figures with stylized or animal heads.

Ofer Bar-Yosef (1985) reports that, in a cave at Nahal Hemar in the Judean Desert, archaeologists have discovered fragments of several stone masks dating back to the prepottery Neolithic B period (seventh millennium BCE). It seems unlikely that these stone masks were affixed to the face of a wearer during ceremonies. They might be funerary masks or the facial part of effigies, or even masks that were hung from poles. Nothing allows a decision in favor of one or the other of these hypotheses. Nevertheless, these stone artifacts are the oldest reliable dated documents testifying to the existence of masks in the seventh millennium BCE. One cannot conclude from this find that there existed at the same time masks worn by living human beings during ceremonies. The oldest document from this point of view seems to belong to Egypt, where the representation of a masked figure appears on a fragment of a wall of the funerary temple of King Sahoure (fifth dynasty, c. 2500 BCE). From a general point of view, however, it may be assumed that the plausibility of the existence of ritual masks increases with the advent of the Late Stone Age, particularly in parts of the Middle East, Africa, and Europe.

WHAT DOES THE RITUAL MASK REPRESENT? Throughout the principal regions in which ritual masks are found—Africa, Melanesia, and the Americas—the majority of the figures depicted in masks are primordial beings, mythical ancestors, culture heroes, and gods. In fact, in most cases the mask is not limited to representing a particular figure: it evokes the events in which said figure played a role. These events are not necessarily enacted as on a theatrical stage; they can be recalled by a dance, by a song or chant, by a piece of costume, or by the recital of a text that accompanies the performance of the mask. They can even be implicit: the mask intervenes in certain circumstances, because the figure it represents was implicated in similar circumstances at the time of origins—a fact known to the initiates at least.

Among the Senúfo of Ivory Coast, for instance, the *kponiougo* (head or face) of the Poro, the men’s secret society,

recalls the original state of the world as it is described in mythological narratives. Among the Dan the mask of the toucan recalls the events that led God to create the earth. Although knowledge of Melanesian myths is only fragmentary, many masks of that part of the world seem to strive to recall paradigmatic events. For instance, the performance of the Mai masks of the middle Sepik of New Guinea is accompanied by the recital of totemic names and mythical texts through a bamboo megaphone. Another mask represents a feminine spirit, who, along with a masculine being often represented in the form of a crocodile, is the protagonist of events that accompanied the creation of the present world.

On the northwest coast of North America, Bill Holm (1972) has noted that the great majority of Kwakiutl masks are worn in representations, in stylized dance form, of incidents from hereditary family myths. In some cases the dance dramatizes the mythical adventure of the ancestor, whereas in others it re-creates a dance given to the ancestor by a mythical being with whom he came in contact. And according to Frank G. Speck (1949), among the Iroquois, at the beginning of each reunion of the False Faces, the chief recalls the confrontation between the original False Face and the Great Spirit, in memory of which the False Faces wear masks with crooked noses. Before entering the home of sick people to minister to them, the False Faces produce weird noises. These nasal sounds are said to be in imitation of the utterances the original False Face made during one episode of his challenge of the Great Spirit.

In the southwest United States the masked dances of the Zuni represent various episodes of their mythology. In the Shalako ceremony, for instance, some dances consist of a mimetic representation of the actions of the kachinas when they want to send rain to the Zuni.

In South America the mask rituals and their symbolisms often have an elementary character. However, careful analysis of the ceremonies reveals that many commemorate the principal episodes of the tribal mythology. The Carajá, who live along the middle course of the Araguaia River, have masks that portray a pair of supernatural parrots whose descent to humankind is related in myth. The Aruana, a dance performed in the same region, bears the name of a fish whose form the Carajá bore before they became human beings.

The use of masks may reflect the will to enact certain events as much as the desire to portray certain figures. At times, masks represent no particular character at all but only events. For instance, Carl Laufer (1970) reports that, among the Mali-Baining of the Gazelle Peninsula of New Britain, the main purpose of the Mandas festival is to represent the events that took place in the primordial mythic time. While a choir of women chants the story of creation, eighty masks enact its various phases: the birth of the sea, the appearance of the earth, the primordial forest, the flora, the winds, the animals and birds, and, when the stage has thus been set, the appearance of the first human couple and their sons. In this festival the *ngoaremchi* masks portray whirlpools and explain

thereby the birth of the sea, which swirled forth in all directions, and the *ngavoucha* masks show how the earth was separated from the waters.

The Dogon of Mali have a mask called *sirige*, a term that can be translated literally as “two-storied house.” This mask consists of a rectangular face surmounted by a high sculpted mast sometimes over five meters high. Marcel Griaule (1938) was told that the *sirige* was recent and profane, a mere sculpture inspired by the view of a two-storied house, and that the wide movements traced by its mast served only to allow the wearer to show off the power of his jaw and neck. Later, French anthropologists were given a more complex idea of Dogon cosmology, and it appeared that both the mask and the house recalled the same series of mythical events.

When the masks are shown in the main square of a Dogon village, the rich ensemble of things, animals, and human figures is a reproduction of the world, a catalog of both the live and extinct fauna of the cliffs and the plains. This display recalls all of the public functions, the trades, the ages; it presents a host of strangers, friends, or enemies; it mimics a wide variety of essential activities, all in a specified order, at least theoretically. It is truly a cosmos. When the mask society gets under way in the public square, it dances the march of the world; it dances the system of the world.

In some cases the system within which a population lives may be represented not by the ensemble of masks but by one particular mask that summarizes the entire system. Among the northern Igbo of eastern Nigeria, the mask *ijele* is a lofty tableau of figures with trappings hanging from its bottom edge to conceal the performer, who carries the whole structure on his head. According to John S. Boston (1960), the theme of the tableau that occupies the upper section of the *ijele* is the life of a typical Igbo community. Marie-Claude Dupré (1968) also tells that, among the Bantsaya group of the western Téké, the mask of the Kidumu dancer is a true summary of the culture of the group.

Masks are thus closely linked to the founding events of a society and its institutions, as well as to its values. It is therefore easy to understand why among many peoples the mask is linked to conservative forces and plays an important role in social control, assuming even a quasi-police function. The few examples given above also show that the primary function of masks is to represent rather than to conceal.

Sometimes the masks lose their ritual value at the end of the ceremonies of which they have been a part. This widespread phenomenon has often surprised observers. For instance, Francis E. Williams (1940) wondered why the *hevehe* masks of the Elema of New Guinea had to be killed and destroyed at the end of the ritual cycle, only to be re-created in the next cycle, when they might pass from one cycle into the other as if living throughout. He was puzzled to see the products of years of industry and art so readily consigned to the flames. This surprise in the face of the abandonment or destruction of the masks once they have been used reveals

the bias of Western interpreters. First, Western interest in the mask as an artifact highlights the finished product and underestimates the ritual value involved in its making. Further, the Western tendency is to consider the masked ceremonies as theatrical performances and to think that all the preparations that precede them find their meaning only in the performance itself. This is a distorted view of those ritual cycles; often the making of the mask is in itself a ritual that reproduces the various phases of the creation of the archetypal mask. Therefore it is vitally important that the following cycle start anew at the beginning; that is, with the making of the mask. This is probably the reason why masks can be destroyed or left to rot without regret at the end of a cycle.

THE MASK AND ITS WEARER. The notion of a “primitive mentality” was prevalent among writers at the beginning of the twentieth century. One of the principal characteristics of this mentality was the supposed inability to truly differentiate between the being and its appearance, the thing and its image, the signifier and the signified. Influenced by this view, most of the books on ritual masks spread a theory according to which the wearer of the mask not only represented a certain figure (ancestor, culture hero, god) but actually became this figure. For these authors, therefore, to put a mask on was akin to undergoing a real transformation. Some scholars took this theory even further and claimed that it provided an explanation for the phenomenon of masking itself. According to them, masks stemmed from the possibility they gave people to liberate themselves, to repudiate their current personalities, to undergo metamorphosis.

The conditions of ethnographic fieldwork do not always lend themselves to an evaluation of the precise level of reality on which the presence of a mythical being is located in a given ritual. But in light of available knowledge, the range in which the various hypotheses mentioned above may apply is becoming narrower and narrower. The best studies show that cultures that utilize masks are perfectly capable of distinguishing between the thing and its image.

For instance, in 1938 Griaule wrote that the Dogon did not fit the prevalent assumption about the attitude of Africans toward the images they create. Far from being fooled by the appearances or the material effects of the ritual, they were definitely aware of the difference between the thing represented and its image. They even had a word, *bibile*, to express the concept of reproduction, image, resemblance, or double. A photograph was the *bibile* of the person it represented. The shadow of a living being was considered a *bibile* because it reproduced the silhouette, the posture, and the movements of that person. A masked dancer was called *imina bibile*, meaning appearance or reproduction of the mask. Similar findings have been made among numerous other societies of Africa, Oceania, and the Americas.

Other factors also seem to reduce the applicability of the metamorphosis thesis. For example, masks are rarely associated with possession of the wearer, although that would be in the logic of the hypothesis. Also, the initiates in those

communities in which masks are found constantly stress the fact that only the uninitiated believe they are actually in the presence of a spirit or a god. These statements are difficult to reconcile with the metamorphosis thesis. They have from the very first forced the proponents of that thesis to embark on often complicated explanations in order to bring their theory into harmony with the ethnographic data.

Similarly attempts to explain the ritual mask phenomenon by a desire, a need, even an instinct of the wearer were probably influenced by theories geared to explain the persistence of Carnival masks in the Western world. In one example of what Edward Evan Evans-Pritchard (1965) called the "if I were a horse" type of guesswork, the feeling of liberation experienced by Western mask wearers was projected onto African, American, or Melanesian mask wearers. Even if such a feeling may exist among some of these people, it cannot be used as a general explanation of the masked-ritual phenomenon.

Moreover, wearing a mask often carries social responsibilities that make it a service rather than a liberation. This service is often compulsory: reprobation, a fine, or worse await those who try to sidestep it. Either one particular person or a category of people is compelled to perform this service: one or several members of the family of the deceased, all members of a brotherhood, all circumcised males, and so forth. Although wearing a mask can bring honor and prestige, it also burdens the wearer with various duties, such as the payment of a tax to purchase the right to wear a particular mask or several months of preparation during which the mask wearers learn the dance steps, intensively rehearse combined movements, and may have to memorize complicated texts, sometimes in a secret language.

Among the Asmat of Irian Jaya, for example, it takes four to five months to prepare the masks for the ritual called Jipae. H. C. van Renselaar reports that, during all of that time, the mask wearers have to support the mask makers (van Renselaar and Mellema, 1956). The relatives of the deceased for whom the Jipae is celebrated must in turn give daily supplies of food to the mask wearers. Furthermore, the mask wearers must act as the surrogate for the dead and adopt and provide for the children of the deceased.

THE MASK AND THE DEAD. One mask has been constantly associated with the representation of the dead: the skull mask. Some experts, such as Hans Nevermann, have considered it the most primitive form of masking (Nevermann, Worms, and Petri, 1968). Those partial or complete skulls, worn on the top of the head or in front of the face, decorated, remodeled, or covered with tight skin, have provoked a number of speculations. Frobenius considered them part of a logical continuum of mask making that began with the use of a complete skull and moved to the use of a skull mask, concluding with the mask carved out of wood. Skull masks are found in the three main mask regions. In Africa such masks are sometimes tightly covered with skin in a manner peculiar to the Cross River region, where Keith Nicklin (1974) re-

ports this same technique is used also to cover the wooden supports of masks. In Mesoamerica the Aztec often combined the techniques of remodeling and decorating the skulls (e.g., with turquoise).

However, as noted by Hans Damm (1969), the Melanesian masks have given rise to the most speculation. In Melanesia the skull is partially or entirely remodeled or molded over with a kind of wax; it is then painted and often adorned with human hair. These techniques are not, however, limited to the making of masks. They are also used in the making of funerary effigies (for example the *rambaramp* of Malekula) and in the remodeling of heads that are preserved in cult houses and in dwellings. The same techniques are also used to mold human heads on wooden supports.

Because of the radical changes these traditions have undergone, many of the assumptions made and questions raised about them may never be checked or resolved. However, an examination of some other Melanesian masks portraying deceased historical persons (as opposed to those that portray the dead as a class) help define a general context in which the skull mask can most probably be placed.

In the Jipae ceremony of the Asmat, for example, masked men represent the dangerous dead, especially children, great warriors, and the victims of headhunters. Beginning at dusk the masqueraders dance, imitating the waddle of the cassowary bird. At sunrise the dancers move toward the men's house followed by the women. Suddenly the men of the village attack the masks with sticks, forcing them to enter the men's house and thus ending the ritual. In the Jipae the mask represents a specific dead person, but several solar characteristics are also ascribed to it. This ritual begins at nightfall, when, according to the Asmat, the sun puts on its mask to descend into the land of the dead. The dancers imitate the cassowary, which the Asmat associate with the sun. Finally, the ritual ends at sunrise; that is, when the sun leaves the land of the dead and removes its mask.

To understand the meaning of a ceremony of this type one must keep in mind that for a large number of societies, in Melanesia as well as in other parts of the world, it is not death itself but ritual that opens the way toward the next life. This ritual fulfills several functions linked together: it prevents the spirit of the dead from wandering among the living; it allows deceased persons to enjoy the status due to their rank in the hereafter; it removes the risk that—in despair about their unresolved fate—the deceased might act against the living to force them to celebrate the appropriate ritual. This ritual may also mark the end of mourning, it may be the occasion of the redistribution of the land, or it may serve as a framework or a background for initiations. It is mostly during this kind of ritual that masks representing deceased individuals intervene.

Early-twentieth-century scholars were so preoccupied with the idea that the mask wearer was adopting a new personality that they overlooked one of the mask's main pur-

poses—which may have been to identify the dead with his or her paradigm (the first dead human, a culture hero) and not just to associate the mask wearer with the spirit of the dead. This is nevertheless one of the important elements of such rituals as the Malanggan of New Ireland, the Ne-leng of Malekula, the Horiomu of the Kiwai, the Jipae of the Asmat, and the Mbii-kawane of Mimika (New Guinea).

This identification can take various forms that fall between two extreme poles. In some cases nothing is done to bring the appearance of the masked figure, as it is defined by tradition, closer to that of the deceased. In those cases it is mainly the attitude of kin that expresses this identification; they act toward the masked figure as they would toward the departed they are mourning. The ceremony called Mbii-kawane described by Jan Pouwer (1956) is close to this type. In other cases a considerable effort is made to ensure that the masked person will resemble the deceased as closely as possible. In this case the identification with the paradigmatic figure is made through the text, which is sung or recited, and through the dance steps. This seems to be the case with the Horiomu of the Kiwai as reported by Gunnar Landtman (1927).

The above remarks also pertain to a number of funerary masks. This term has been used to categorize various types of masks found on mortal remains, on mummies, on funerary urns, or among the funerary furnishings found in certain tombs. Some of these masks are realistic and seem like portraits, and they have on occasion been molded directly onto the dead person's face. Others, sometimes called "idealistic," reveal traits that obviously did not belong to the deceased. In between those two categories, variations such as idealized or stylized portraits are found. Others, finally, do not have a real face. In some cases the mask could have been worn by somebody during a burial ritual, whereas in other cases there is no evidence to support that interpretation.

Given the extensive variations that may be found from one tradition to the next, funerary masks seem to have two basic purposes: (1) to prevent the spirits of the dead from wandering among the living (by offering them a new support, by luring or forcing them away from the living); and (2) to insure that the deceased will safely reach his or her resting place in the hereafter. The identification with a paradigm should not be overlooked as a means to achieve this goal.

MASKS, WOMEN, AND SECRET SOCIETIES. According to the Viennese school of the "culture circles," in a former era women played a leading role in society, and in order to resist their economic, social, and religious supremacy, men created secret societies. The theory postulated a quasi-organic link between secret societies and masks, the latter being the means used by men to seize power from women and secure their own domination. This link was even noted by authors who did not necessarily accept the hypothesis of matriarchy. Here, summarized in four points, is how Felix Speiser (1923) expressed it: (1) the goal of secret societies is to terrorize the uninitiated, in particular women; (2) this is achieved through

the use of masks representing spirits; (3) for masks to represent spirits the wearer must not be recognizable; and (4) it follows that originally masks must have disguised the wearer's entire body.

This theory was immensely popular, for it offered a logical and unique framework for an array of puzzling facts. However, along the road taken by anthropology since the 1930s, every one of its elements was disputed and abandoned. Regarding secret societies, the apparent simplicity of the theory stemmed from the fact that its authors had amalgamated extremely diverse institutions under the term *secret society* (e.g., brotherhoods of men, age-group organizations, initiation societies, societies based on social rank, and more or less restricted cultic societies). Furthermore, later studies showed that masks could very well exist independently of secret societies and that many secret societies had no masks, while others had only recently adopted them. Therefore the concept of a primary and original link between masks and secret societies could no longer be taken uncritically.

As for secrecy, it is true that, in many societies with masks, the uninitiated must not speak of matters concerning masks, or they must only speak of them in a certain manner, or they are supposed to remain ignorant of certain things. However, the best-documented reports from Africa, Melanesia, and the Americas acknowledge that women in particular know the true nature of masks and that a large gap often separates that which they are supposed to know from that which they actually know. Secrecy, or the pretense of it, is but one element that helps delineate and maintain the identity of the various groups in a given society, but it cannot be taken literally.

The theory contended that masks were meant to terrorize women. However, because in many cases women were aware of the true nature of the masks, they could not be fooled by a ritual, the purpose of which would be to deceive them. Yet they display emotions, sometimes violent ones, during the performance of certain masks. If they are not fooled by appearances, then how can those feelings be explained?

When women express fear when confronted with the masks or when they recognize in them the deceased of their own families and implore them with cries and tears, one is forced to wonder if such a display of emotions is not an essential part of the ritual itself. There is no doubt that women are frightened in many societies. But they are afraid of the consequences that would follow if they did not behave as tradition requires or if they breached the prohibitions surrounding the masks. Depending on the situation and the society, a fine would be levied; a sacrifice would have to be made; the woman would become sick, sterile, or even die; the men might kill her; the mask wearer would die; or the entire community would disappear. But this does not mean that women act merely out of fright and that their emotions (for instance, their grief) are not genuine. Indeed this does not rule out sincerity in any way, but a sincerity that is ad-

dressed to what is represented in the ritual and a sincerity that cannot be understood unless one first accepts that all the participants may experience the ritual at the level of what is being represented while remaining perfectly aware of the means used to create the performance. The deeper meaning of masked rituals can only be perceived if one acknowledges that the behavior of everyone concerned is meaningful, the women's as well as the men's, both contributions being at once necessary to the ritual and constitutive of it.

The elegant "culture circles" hypothesis presented the relationship between masks and women as one of incompatibility, ignorance, and credulity. A detailed examination shows that the situation is more complex and differentiated. Indeed the prohibitions to which women are subject sometimes only cover a particular part of the mask or a special circumstance. It is also impossible to ignore the particular position that certain women occupy within the masking society (among the Dogon, the Kono, or the Mende, for instance). In certain cases women contribute to the preparation of masks or dancers or are entrusted with the care and preservation of the masks and other ritual objects otherwise prohibited to women. In addition, the wives of chiefs and the wives of the heads of initiation societies are sometimes initiated into the secrets of masks, and, from a more general point of view, numerous elderly women are exceptions to the "rule" that all women be excluded from masking rites. Last but not least, there are of course cases—attested in Africa, Melanesia, and the Americas—when masks are worn by women, often during women's initiations. Due to the anthropocentrism of early scholarship, little information was available on these ceremonies when the theory was proposed. Fortunately, since the 1970s this situation has been changing rapidly (for instance, see Sidney L. Kasfir and Pamela R. Franco [1998]).

However, even taking into consideration the numerous cases mentioned above, a simple statistical study will show that in most instances masks are worn by men, even though women are said to have discovered and owned them to begin with. Thus, if the masked ritual must be viewed in the context of a symbolism shared by men and women, the dialectic between the two sexes that the ritual reveals must not be neglected. It comes back to the sacredness peculiar to each sex and to the ambivalent attitude of men toward the extraordinary power of women: particularly with regard to women's ability to conceive and to self-regulate their uncleanness through their menstrual cycles.

HENRY PERNET (2005)

MAŞLAHAH is the Arabic term for the Islamic concept of public interest or general welfare of the community of Muslims. Consideration for the public interest (*istiṣlāḥ*) is held by Muslim legal scholars to be ancillary to the four canonical sources of Islamic law, namely the Qurʾān; the *sunnaḥ*, or normative behavior of the Prophet; *ijmāʿ*, or the historical consensus of the community; and *qiyās*, analogical extension of accepted law or judgment. Although these sources are meant to provide guidelines for all eventualities, there have always been instances that seem to require abandoning either the specific ordinances of the Qurʾān and *sunnaḥ* or the results of analogical reasoning, because of the overriding nature of the public interest.

In positive or applied law, considerations of *maşlahah* in social and economic matters have usually led to the inclusion of pre-Islamic or non-Islamic local laws and customs in regional local practice. Historically, the concept of *maşlahah* has been associated more often with Mālikī school than with the other Sunnī schools of law. This is largely due to the attention the Mālikī scholars of Morocco have given it in their recognition of the validity of local practice (*ʿamal*), even though they thereby allow institutions that strict Mālikī theory would reject. But the association of *maşlahah* with the Mālikīyah should not be overemphasized; all Sunnī schools of law have contributed to its development and utilization.

The early and medieval Muslim scholars who wrote on *maşlahah* defined it in various ways. Some approached it purely from a practical point of view; others considered it a problem of the philosophy of law and discussed its moral and ethical aspects. They all indicated, however, that the investigation of *maşlahah* involved concern for the spirit rather than the letter of the law. Focusing on this feature of *maşlahah*,

a few twentieth-century Muslim reformers have put forward the idea of redefining *maṣlaḥah* in terms of the needs of contemporary society and then using *istiṣlāḥ* as a vehicle for modernizing and revitalizing Islamic law. Thus far, at least, their efforts have not been successful.

MASORAH SEE BIBLICAL LITERATURE, *ARTICLE ON HEBREW SCRIPTURES*

MASPERO, HENRI (1883–1945), French Sinologist and pioneer of Daoist studies. Son of the Egyptologist Gaston Maspero, Henri Maspero did his first research in 1904 in Cairo on the financial system of ancient Egypt. In 1907 he obtained his *licence en droit* and his diploma in Chinese. From 1908 to 1920, he was a member of the École Française d'Extrême-Orient (EFEO) and was stationed in Hanoi, whence he traveled extensively throughout Southeast Asia and China. He was in Beijing during the winter of 1908–1909, at the time of the death of Emperor Tezong and the Dowager Empress Cixi, and he witnessed some of the ensuing revolutionary agitation. His research and publications covered an amazing range of subjects: the administrative geography of ancient Indochina, the beginnings of Buddhism in China, Chinese epigraphy, history of law, architecture, art, and astronomy, as well as linguistics. His articles on the Thai languages and on the phonetics of Annamese were the first serious studies of Southeast Asian languages. The Chinese elements in Annamese led him, before Bernhard Karlgren, to the study of ancient Chinese phonology.

In 1914, on a study mission to China, Maspero began an investigation of contemporary Chinese religious life, which he continued among Chinese expatriates in France during World War I. This fieldwork enabled him later to describe the modern Chinese folk religion in a remarkably lively fashion.

Maspero initiated and supervised, until 1920, the vast EFEO collection of Indochinese documents, a unique repository of the history of this region. Some of this material served him for comparative studies on modern Thai and ancient Chinese religion, studies that confirmed the results of

Marcel Granet's epoch-making work (1919) on the *Book of Odes*.

In 1920 Maspero was recalled to Paris and appointed the successor of Édouard Chavannes at the Collège de France. The only book he published in his lifetime, *La Chine antique* (1927), is a history of China from the beginnings to the third century BCE. The remaining years of his life were devoted to a thorough preparation of a second volume dealing with Chinese history up to the Tang dynasty.

The summaries of Maspero's courses at the Collège de France (1921–1944) show that, among many other aspects of Sinology that he treated in numerous articles, he was most interested during this period in the emergence of the Daoist religion. This was virgin territory, uncharted not only by Western scholars but also by Chinese scholars, who traditionally had despised everything Daoist except the philosophers Lao-tzu and Chuang-tzu. In 1926 the sole remaining complete set of the Daoist canon was published in 1,120 Chinese-style volumes. Maspero was the first to start extracting from this huge store of documents (dating from the fourth century BCE, in the case of the early Daoist mystical writings, to the sixteenth century CE) a chronology of texts and a coherent history of the origins and the first five centuries of the Daoist religion. He discovered that this religion, far from being the popular hodgepodge of superstitions described by missionaries, or the illiterate and seditious demon-worship denounced by the Chinese scholarly elite, was in fact the native high religion of all classes of Chinese society, with a literate tradition going back to the second century CE. Realizing the importance in Daoism of physiological longevity techniques and of mystical techniques for gaining union with the Dao (and participating in its immortality), Maspero devoted a detailed study to them.

On July 27, 1944, Maspero was expected in vain at a session of the Académie des Inscriptions et Belle-Lettres, of which he was president at the time. He had been arrested by the German occupation forces because of his son's activities in the French Resistance. On August 15, 1944, he was aboard the last prisoner transport to Germany before the liberation of Paris. He succumbed to disease amid the horrors of Buchenwald on March 17, 1945, less than one month before the liberation of this concentration camp by American troops.

Maspero's *La Chine antique* (Paris, 1924) has been translated as *China in Antiquity* (Amherst, Mass., 1979), and the majority of Maspero's studies on Daoism have been collected in *Le daoïsme et les religions chinoises* (Paris, 1971), translated as *Daoism and Chinese Religion* (Amherst, Mass., 1981). Among Maspero's writing on Buddhism are "Le songe et l'ambassade de l'empereur Ming" and "Communautés et moines bouddhistes chinois au deuxième et troisième siècles," both of which appear in the *Bulletin de l'École Française d'Extrême-*

Orient (Hanoi) 10 (1910): 95–130 and 222–232, respectively, and “Les origines de la communauté bouddhiste de Lo-yang,” *Journal Asiatique* 225 (1934): 88–107. On mythology and popular religion, see “Légendes mythologiques dans le Chou king,” *Journal asiatique* 204 (1924): 1–100; “The Mythology of Modern China,” in *Asiatic Mythology*, edited by Joseph Hackin and others (New York, 1932); and “Les ivoires chinois et l’iconographie populaire,” in *Les ivoires religieux et médicaux chinois d’après la collection Lucien Lion*, edited by Maspero, René Grousset, and Lucien Lion (Paris, 1939).

An obituary by Paul Demiéville, including a useful bibliography, appears in *Journal Asiatique* 234 (1943–1945): 245–280, and Demiéville’s summary of Maspero’s contribution to Chinese studies, “Henri Maspero et l’avenir des études chinoises,” can be found in *T’oung pao* 38 (1947): 16–42.

ANNA SEIDEL (1987)

MASS SEE EUCHARIST

MASSIGNON, LOUIS (1883–1962), French Islamicist. Louis-Fernand-Jules Massignon grew up in Paris, where he enrolled at the university and pursued various disciplines, including Arabic. He spent most of the period 1906–1910 studying in Cairo and carrying out research in Iraq and Istanbul, and in 1912–1913 he was visiting professor at the Egyptian (later Cairo) University. In 1922 he submitted his two requisite doctoral theses on al-Ḥallāj and early Islamic mysticism to the University of Paris; published in two volumes as *La passion d’al-Hosayn-ibn-Mansour al’Hallāj, martyr mystique de l’Islam exécuté à Bagdad le 26 mars 922* (1922), his *thèse principale* has since become a classic. A second, greatly enlarged edition appeared posthumously (1975). In 1926 Massignon was elected professor of sociology and sociography of Islam at the Collège de France in Paris, and in 1933 he was appointed director of studies for Islam at the École Pratique des Hautes Études, also in Paris, in the section of *sciences religieuses*. In the same year he was elected a member of the new Academy of the Arabic Language in Cairo, where he spent several weeks working each winter.

Born and raised a Roman Catholic, Massignon underwent a particular inner experience in 1908, which he spoke of as his “conversion.” As a result he became once more a loyal member of the Roman Catholic church, increasingly with a spiritual vocation with regard to Islam. In 1931 he became a third-order Franciscan, and in 1934 he founded the Badaliya sodality, the members of which were inspired by compassion and devoted themselves to “substitution” for their Muslim brethren. (The idea of substitution involves one person’s taking another’s suffering upon himself.) After joining the Greek Catholic (Uniate) church in 1949, Massignon was ordained a priest on January 28, 1950, in Cairo. Even though ordination in this church is possible for a married man, as Massignon was, the Vatican imposed the condi-

tion that Massignon’s priesthood, which turned out to be an essential element in his spiritual life and vocation, should remain secret. Even after his retirement in 1954 Massignon continued to take an active part in defending victims of violence (e.g., Palestinians and Algerians) until his death on October 31, 1962, in Paris.

Massignon’s work is the accomplishment and creation of a mind of remarkable stature, illuminated by flashes of genius but capable of being carried away, to the verge of aberration, by ideas. A reader is confronted with the difficult task of recognizing the particular perspectives in which Massignon interpreted his subject matter and correcting them according to the scholarly criteria of factual interpretation and validity. If Massignon’s unique spiritual commitments made his oeuvre one of the richest in the whole field of Islamic studies, one must recognize that it drew its strength from an existential position unrelated to scholarship. While its originality deserves respect and admiration, the lack of scholarly standards must also be recognized.

Massignon’s monumental study of al-Ḥallāj will probably remain his lasting contribution to the study of Islam and religion generally. It is more than a careful historical reconstruction of facts and bygone spiritual worlds. It is the record of a spiritual encounter in which a scholar fascinated by a religious truth meets a mystic of the past in whom this truth is recognized. Were it not for Massignon, such spiritual dimensions might not have been revealed in al-Ḥallāj, but to what extent the spiritual al-Ḥallāj discovered by Massignon is the result of valid hermeneutics of the texts and not a spiritual creation born of the religious needs and passions of Massignon as a person is a question that haunts the reader. Massignon’s inner experiences of May and June 1908, as a result of which he received a “new life” of adoration and witnessing, welded together for him the figures of al-Ḥallāj and Christ, the existence of God and the experience of divine grace. Thereafter, al-Ḥallāj, Christ, and their witness Louis Massignon could no longer be separated either by Massignon himself or by those studying his reconstruction of the Hallajian drama.

Massignon’s second contribution is his precise technical investigation of the religious, particularly the mystical, vocabulary in Islam. Apart from his claim that the spiritual realities to which these words allude can be rediscovered through the study of the words themselves—and that the researcher at a certain moment finds himself confronted precisely with that reality to which the mystic testifies—his technical achievements were enormous and have inspired such scholars as Paul Nwyia to proceed with their researches on religious vocabulary along the same line.

Massignon’s third major contribution is to have succeeded, in a period of ever-growing specialization, in retaining a global view of what may be called the world of Islam in its various material and spiritual dimensions. He could see it all as forming a meaningful whole under the sign of Islam, just as he could see Islam as meaningful in the perspective

of al-Ḥallāj. Thus his “minor works,” collected in *Opera minora* (1963), include articles on widely varying subjects. Throughout these articles we find a complex hermeneutics of texts, personalities, and ideas directed to revealing not only their literary, historical, and semantic meanings but also their spiritual intentions. In his hermeneutical research, Massignon showed both an immense erudition and an extraordinary sensitivity, particularly to religious and devotional realities. His sensitivity extended to those realities that exist partly in the realm of dreams and partly in that of fact, realities to which the religious mind and what was once commonly called the “Oriental mind” are so attuned.

BIBLIOGRAPHY

Massignon’s principal work is his monumental study of al-Ḥallāj, the second, greatly expanded version of which appeared posthumously in four volumes (Paris, 1975), and has been translated by Herbert Mason as *The Passion of al-Ḥallāj: Mystic and Martyr of Islam*, 4 vols. (Princeton, 1982). Another classic study is his *Essai sur les origines du lexique technique de la mystique musulmane*, 3d ed. (Paris, 1968), which deals with the development of mystical vocabulary during the first centuries of Islam. A number of mystical texts were edited by Massignon in his *Recueil de textes inédits concernant l’histoire de la mystique en pays d’Islam* (Paris, 1929). A translation of al-Ḥallāj’s poems, the *Dîwân* (1955; reprint, Paris, 1981), was also published by Massignon. Of Massignon’s other books, mention should be made of *Mission en Mésopotamie, 1907–1908*, 2 vols. (Cairo, 1910–1912), and of the various editions of the important *Annuaire du monde musulman* that were compiled by Massignon (1st ed., Paris, 1922–1923; 2d ed., Paris, 1926; 3d ed., Paris, 1929; 4th ed., Paris, 1954). (The last of these volumes was accomplished with the collaboration of Vincent Monteil.) A collection, edited by Youakim Moubarac, of 205 of Massignon’s articles has been published under the title *Opera minora*, 3 vols. (1963; reprint, Paris, 1969); two more volumes have been announced.

Bibliographies of works by and about Massignon appear in Youakim Moubarac’s *L’œuvre de Louis Massignon* (Beirut, 1972), pp. 7–107; the book is, however, difficult both to find and to use, and is incomplete. A definitive bibliography with complete references has yet to be compiled. Most accessible at present is the succinct bibliography given in my *L’Islam dans le miroir de l’Occident*, 3d ed. (The Hague, 1970), pp. 351–358. These bibliographies may be supplemented by that contained in Guy Harpigny’s penetrating study of Massignon’s work and spirituality, *Islam et christianisme selon Louis Massignon* (Louvain-la-Neuve, 1981), pp. 295–301. To celebrate the one hundredth anniversary of Massignon’s birth, UNESCO issued a useful brochure titled *Centenaire de la naissance de Louis Massignon, 1883–1962* (Paris, 1983).

JACQUES WAARDENBURG (1987)
Revised Bibliography

MATERIALISM. As a philosophical doctrine, materialism can be given a deceptively simple definition: the view that matter is all there is. The simplicity is deceptive because, of course, the term *matter* can itself be understood in so many different ways. It is more illuminating, perhaps, to define materialism in terms of what it denies. It excludes the existence of entities that are radically different in kind from, and in some sense superior to, the matter of our ordinary experience. It rejects, therefore, a God or gods on whom the universe would depend for its existence or mode of operation; it denies the existence of angels or spirits that can affect the material order while ultimately escaping its limitations; it questions the notion of a soul, if taken to be an immaterial entity separable in principle from the human body it informs. Its two main targets are, therefore, theism and dualistic views of human nature.

Materialism has, in the past, usually derived from one or the other of two sources. The first is the conviction that the world can be understood in terms of a single set of categories derived from our everyday physical experience, without having to introduce a second set of “immaterial” entities of an altogether different kind. The second is the criticism of organized religion on the grounds of its superstitious or politically oppressive character and a linking of religion with belief in gods, angels, souls, miracles. The former allies materialism with naturalism. The stress in both is on “natural” modes of explanation; “supernatural” forms of action are rejected as unnecessary or even incoherent. Materialism also resembles reductionism, since both seek to reduce the diversity of the explanations offered for events in the world to a single category, or at least to a minimal number of categories. There are, for the same reasons, overtones in it of positivism, at least to the extent that both lay stress on science as the only legitimate source of knowledge about the causalities of the world. Where classic materialism would differ from these other philosophic emphases would be mainly in the specificity of its objections to the category of “spirit” on which religious belief is taken to rely.

BEGINNINGS. It is to Aristotle (384–322 BCE) that we owe the first explicit articulation of a concept of “matter,” that is, an underlying substratum to which reference must be made in explaining physical change. Aristotle criticizes the Ionian physicists, his predecessors of two centuries earlier, because of their supposedly exclusive reliance on a common underlying “stuff” (water, air, fire) in explaining change in nature. Such a stuff would retain its own identity throughout

all change; substantial change would, therefore, be excluded and the apparently fundamental differences between different kinds (different species of animal, for instance) would be reduced to mere differences in arrangement of the fundamental “stuff.” Aristotle rejected this “materialist” doctrine. But he did not believe the Ionians to be materialists. He notes that Thales thought all things to be “full of gods” and to be in some sense “ensouled”; similar views are attributed to the other major figures in the early Ionian tradition. Though these men made the first known attempt to explain physical changes in a systematic way, they did not question the traditional explanatory roles of the gods and of soul.

A century later, the founders of atomism, Leucippus and Democritus, came much closer to a clear-cut materialist doctrine. Their view that all things consist of “atoms,” imperceptibly small, indivisible, eternal, and unchanging entities, derived from the metaphysical arguments of Parmenides regarding the One, not from an empirical starting-point in observation. Change is nothing more than the movement and redistribution of atoms in the void. The planets, the stars, and even the earth itself have come to be by the aggregating of vortices of atoms. Since space is infinite, there will be infinitely many worlds produced in this way. Sensation is to be understood in purely physical terms; the soul itself consists of atoms, admittedly smaller and finer than even the particles of fire, but still of the same general kind as other atoms. All interaction is thus mechanical and explanation in terms of final causes is prohibited. Yet the atomists do not appear to have excluded the gods. Though Democritus is critical of those who would base ethical behavior on religious sanctions, he does seem to allow that the gods may visit men. This may, of course, have been no more than a concession to the orthodoxy of the day. Yet it would seem more likely that he had not yet reduced the gods, as he had done soul, to matter.

Epicurus (341–270 BCE) took this further step. The gods are situated in the intervals between the innumerable universes; they too must be composed of atoms, and they live in a state of bliss undisturbed by the affairs of mortals. Lucretius (99–55 BCE) popularized the teachings of Epicurus in the Roman world through his great poem, *De rerum natura*, which was the most complete expression of materialist doctrine in ancient times. The gods here seem to be dismissed entirely; insofar as there is a deity it is nature itself. Lucretius views the state religion of Rome as a primarily political institution and sees no reason for any exception to the atomist claim that all there is, is atoms and void.

THE RENAISSANCE. With the growth of Christianity, the attraction of Epicurean materialism diminished. During the Middle Ages, atomism was sometimes discussed by philosophers, but the Aristotelian arguments against it seemed overwhelming. There could be no serious defense of materialism in an age when the influence of spirit, in all its forms, seemed so palpable and when no plausible argument had been found for the claim that all change can be explained in atomic or

material terms only. It was only when the “new science” of mechanics made its appearance in the seventeenth century that the outlines of an argument became faintly visible. Galileo and Descartes took for granted that matter is composed of a multitude of tiny corpuscles whose properties (“primary qualities”) are precisely those required to make them subject to, and entirely predictable by, mechanical law. There was no real evidence for this, but it seemed plausible to extend the realm of the new mathematicized mechanics to the very small and thus make all types of physical change explicable, perhaps, in mechanical terms.

Pierre Gassendi (1592–1655) could now revive the ancient Epicurean atomism and present it as the best available (though admittedly hypothetical) scientific explanation of the sensory qualities of things. However, he did not carry his Epicureanism all the way to materialism; though an opponent of the claims to demonstrative knowledge made by scholastics and Cartesians alike, he was not disaffected with religion and saw no reason to extend atomism to the soul or to use it to deny the need for a creator God. His friend Thomas Hobbes (1588–1679) had no such scruples. A severe critic of institutional religion, he argued that mechanical modes of explanation must be extended not only to sensation but to thought, which is no more than the motion of material particles in the brain. Nothing other than body can exist, so that God, if he exists (and Hobbes’s real views on this issue are very difficult to discover), must be corporeal.

REDUCTIVE MATERIALISM. If all material things are to be understood by a single set of laws, the general laws of mechanics, it would follow that human action, too, can be reduced to mechanical law. This is the conclusion Hobbes reached; Descartes avoided it only by placing within man an immaterial mind. Reductive materialism or sharp dualism—these seemed to be the only options, if one decided to bring the entire domain of physical interaction under one science. Most philosophers of the seventeenth and eighteenth centuries found the alternatives unappealing, but it was not at all evident where a stable solution might be found. In France, where reaction against royal as well as ecclesiastical authority continued to mount, reductive materialism found favor with a number of writers, of whom the most original was Denis Diderot (1713–1784), editor of the great *Encyclopedie*. Influenced by George-Louis Buffon’s *Natural History* (1749), he speculated about the sort of developmental laws that might have brought about the organic world we know from an initial chaos of material particles. A number of medical writers, of whom the most notable was Julien de La Mettrie (1709–1751), were at the same time developing a materialist physiology in which human action is reduced to simple mechanical causes. Paul d’Holbach (1723–1789), on the other hand, was much more metaphysical in his approach. His *Système de la nature* (1770) was the most thoroughgoing materialist statement of the century; in it, the two sources of classic materialism are especially evident: a conviction that because matter is one, only one sort of explanation is permissible, and a strong hostility to religion.

But the weaknesses of this kind of material monism were still evident. The claims to explain in mechanical terms the operations of the human body, to reduce sensation and thought to mechanical action between molecules, and to derive the profusion of organic species from an original undifferentiated matter were still almost entirely promissory. Materialism was still, at best, a program, not an achieved philosophy. To become something more, a genuine materialist science would have to be available to serve as support. And one of the fundamental premises of classic materialism, its reductionist principle, might have to be abandoned.

Major philosophers of the day were struck by the crudity, as they saw it, of the materialist doctrine. Hegel, in particular, attacked the mechanistic presuppositions of Newtonian science, its assumption that all motion can be explained by the single science of mechanics. In its stead, he attempted to construct a philosophy of nature and a theory of history in which spirit is the moving force. Motion involves contradiction, since for it to occur, a body has to be “both here and not here at the same time.” Thus, contradiction pervades both nature and society; it is out of the consequent struggle and opposition that advance comes.

DIALECTICAL MATERIALISM. The most influential form of nonreductive materialism is undoubtedly that of Marx and Engels. Marx took over much of the structure of Hegel’s account of society and of social change, retaining the discontinuities of the Hegelian “dialectical” method, but inverting the order of matter and mind. Mind originates from matter (as the reductive materialists had held), but in a discontinuous way that makes it irreducible to the categories of matter (which they had denied). Beliefs in God or in an immortal soul are no more than the projections of those who would rationalize an unjust social order instead of trying to change it. All knowledge of the world and of society must be based on sense experience and ultimately on science.

Marx’s “historical materialism” is restricted to human history; by taking economic and industrial factors as the fundamental agencies of change, Marx believed that he could give a thoroughly “materialist” (i.e., empirical, naturalistic, scientific) account of history. Engels went on to a broader focus on nature. His “dialectical materialism” (as Plekhanov later called it) is first and foremost a philosophy of nature in the Hegelian tradition. He rejects Ludwig Büchner’s claim that the sciences alone suffice; in Engels’s view (and this has become a central tenet of Marxist-Leninist thought), positivism is inadequate because the sciences have to be supplemented by a unified and guiding philosophy. This philosophy is “dialectical” because it recognizes the presence of contradictions and of discontinuous change in nature and is unified insofar as it proposes a scheme that can grasp things in their totality. Engels characterizes as “idealist” any philosophical view that would deny that mind and spirit must originate from matter. Thus, anyone who believes in a transcendent God or in the dualism of soul (mind) and body would automatically qualify as “idealist” in this new sense.

The attempt on the part of Marx and Engels to “materialize Hegel” led to notable internal strain (many have argued, incoherence) within the materialism they proposed. On the one hand, there is the stress on the primacy of sense-experience (which is said to “reflect” the world) and consequently of science. On the other, the dialectical element (which is crucial to Marx’s political theory) is difficult to sustain by science alone, unless it be almost emptied of content. This tension is even more evident in Lenin’s version of dialectical materialism, which tries to mediate between positivism and Hegelian idealism, utilizing a rather naive realist epistemology.

CHRISTIANITY AND MATERIALISM. The progress of science since the mid-nineteenth century has undercut the older reductive materialism by showing that the categories of mechanics at any one time are never definitive and that there are, besides, different levels of explanation that are probably not reducible to one another, not in the sense in which reduction was supposed to be possible, at least. On the other hand, the progress of science has also demonstrated the strength of the naturalistic program of explanation. More and more, it seems possible to explain the entire order of nature in a single interlinked set of categories that leave no gaps “of principle” into which a different order of causality has to be interposed in order to render a coherent account of world process. It is hard *not* to be a “naturalist” in that sense.

Nonetheless, there are unsolved philosophical problems about the relation of mind and body, about the reality of human freedom in a world scientifically fully explicable, that have led to the formulation of alternatives besides that of a sophisticated nonreductive materialism, alternatives that would still maintain a broadly naturalist orientation. These would differ from materialism in the degree of stress they would lay on causal categories that derive from the domain of mind and freedom rather than from that of mechanical action even if the term *mechanical* be construed as broadly as it could plausibly be.

When naturalism/materialism is carried to the point of denying the possibility of a creator God or an afterlife for man, a conflict with religious, and specifically with Christian, belief is unavoidable. Christian theologians, however, have gone to some lengths to try to show that the notions of the natural order as sufficient in its own right, or of resurrection as independent of a strong dualism of soul and body, are perfectly compatible with—indeed entirely faithful to—the Christian tradition. The grounds for the materialist exclusion in principle of God or of a personal afterlife are thus brought into question.

Some have gone further to argue the propriety of a “Christian materialism” that would draw on the positive insights of the materialist tradition, particularly in its Marxist form. Such a view would suggest that all that happens in nature and in history is in principle explicable at its own level without directly invoking the intervening agency of God. “Christian materialism” would note and deplore the manner

in which Christianity, like other religions, has often allowed itself to become the ideological legitimization of structures of social domination. It would oppose the “idealism” that would make Christianity a set of doctrines to be believed rather than a doctrine of redemption that finds its reality first in action and transformation.

The limits of such a view are set by the Christian doctrines of the dependence of nature and history on divine grace and of the entrance of the Word of God, as man, into the human story. There would be the reality to acknowledge of a God whose action entirely transcends the categories of nature. And that is something that materialism cannot do without ceasing (it would seem) to be materialism.

Revised Bibliography

MATERIALISTS, HINDU SEE CĀRVĀKA

MATHER FAMILY. Members of three successive generations of the Mather family were Puritan ministers in the Massachusetts Bay Colony in New England: Richard (1596–1669), Increase (1629–1723), and Cotton (1663–1728). Each achieved fame as a preacher and writer, and collectively they exerted a formative influence on the religious life of colonial America.

Richard Mather, who was born in Lowton, near Liverpool, matriculated at Brasenose College, Oxford, in 1618 but studied there for only a few months. He was preaching at Toxteth Park when, late in 1633, he was removed from the pulpit. His offenses are not known, although they were doubtless ecclesiastical; he did not conform to the practices of the Church of England in all ways. He and his family then immigrated to Massachusetts Bay, arriving in mid-August 1635. The people of Dorchester, Massachusetts, after failing to organize a church in April 1636, succeeded in August of that year, and Mather was immediately called to the church as its teacher.

In the pulpit in Dorchester, Mather served quietly and faithfully. Although in most ways he probably resembled most Puritan ministers of his time in Massachusetts Bay Colony, in several notable accomplishments he differed. He published defenses of the "New England Way," as the church polity of the Bay Colony was called; he helped to write the Cambridge Platform (1648) defining ecclesiastical polity; he contributed to the definition of Puritan baptismal practice in the so-called Halfway Covenant (1662); and he served as an overseer of Harvard College.

Increase Mather, sixth son of Richard, was the outstanding minister of his generation. Born in Dorchester, he entered Harvard College when he was twelve years of age; after graduation he went to Ireland, where he took an M.A. at Trinity College, Dublin. Preaching followed at Torrington in Devonshire, to the garrison on Guernsey, and in Gloucester. However, his heterodox opinions made life in England dangerous for him after the Restoration, so in 1661 he returned to New England. There he was soon asked by the Second Church in Boston (Boston North Church) to fill its pulpit.

Increase Mather spent his life expounding the "New England Way." He was not an innovator in religion; like his father he defended nonseparating Congregationalism. But Increase Mather was a much more imaginative man than his father and a more passionate one. The Puritan vision of New

England as a redemptive society was one of the passions of his life. He saw his American homeland as the one place on earth where true church polity might be established and the Protestant Reformation completed. The defense of New England carried him to England a second time shortly after the Glorious Revolution. He returned with a charter that protected much of the colony's—and its Congregational churches'—autonomy. Increase Mather's other achievements were varied: he acted as president of Harvard College; he wrote about science, especially astronomy; he advised governors; he helped to halt the persecution of those accused in the Salem witchcraft episode; and he preached and published on New England Christianity.

Cotton Mather was the first of Increase Mather's nine children. Although he never left New England, his visible achievements outnumbered those of his father. After a brilliant performance at Harvard College (A.B., 1678), Cotton Mather was ordained a minister in his father's church in 1685; the two served there together until Increase Mather's death almost forty years later. In 1689, while his father was in England securing a new charter for the colony, Cotton Mather played an important role in the expulsion of Sir Edmund Andros, governor of Massachusetts and head of the Dominion of New England. He also supported the witchcraft trials in Salem in 1692, although he was uneasy and had reservations about the proceedings.

Most of Cotton Mather's life was not spent in public affairs. He was a scholar of great learning and power and an immensely successful preacher. His learning extended to almost all fields of knowledge, although theology was the subject he knew most profoundly. Cotton Mather wrote histories, the greatest being his *Magnalia Christi Americana* (London, 1702), biographies (many first appearing in sermon form), scientific treatises, practical guides to medicine, prophetic works, and guides to conduct for the young, for sailors, and for almost every other order of society; most of his works, however, were sermons. He preached a "practical divinity," filled with exhortation and advice on the Christian life. Many of his sermons were intended to convert his listeners; others provided solace and nourishment to believers. Much of his work remains in manuscript, including "The Biblia Americana," his massive commentary on the scriptures.

Like his father, Cotton Mather was obsessed with the history and the future of New England. His great hope was that the second coming of Christ would take place in his lifetime and that New England would in reality prove to be the site of the New Jerusalem. He never surrendered his faith in the Congregationalism of his country, but he did come to preach an ecumenism embodied in his conception of a Christian Union, a worldwide league of believers. Cotton Mather earned a reputation in his day as a splendid preacher and scholar, but he was also widely disliked for the excesses of his style and expression. Despite his pride in his family and his attainments, he died feeling unappreciated and, to some extent, unfulfilled.

BIBLIOGRAPHY

The standard bibliographies of the works of the Mathers are those edited by Thomas J. Holmes: *The Minor Mathers: A List of Their Works* (Cambridge, Mass., 1940), for Richard Mather; *Increase Mather: A Bibliography of His Works*, 2 vols. (Cleveland, 1931); and *Cotton Mather: A Bibliography of His Works*, 3 vols. (Cambridge, Mass., 1940). Useful studies of the Mathers include Kenneth Murlock's *Increase Mather: The Foremost American Puritan* (Cambridge, Mass., 1926), my own *The Mathers: Three Generations of Puritan Intellectuals, 1596–1728* (New York, 1971), and Kenneth Silverman's *The Life and Times of Cotton Mather* (New York, 1984).

ROBERT MIDDLEKAUFF (1987)

MATRES. The *matres* or *matrae* ("mothers"), Celtic feminine divinities, are attested throughout the ancient continental and insular Celtic domain (with the exception of non-romanized Ireland) by abundant Romano-British and Gallo-Roman epigraphic and iconographic testimony. The word is Latin, but it can only be the translation or adaptation of a Celtic word, as the Gaulish inscription at Nîmes consecrated to the *matrevo namausikavo* ("Nimesian mothers") witnesses. On the evidence, the *matres* as a group are very diverse, and it would be difficult to propose a single explanation for them. A *matre* may be conceived in terms of a particular locale, a certain function, or a principle and sphere of sovereignty. Specific instances are frequently multiple: the Suleviae, solar goddesses who have been unduly transformed into psychopomps; the Iunones, who are multiple forms of the Latin goddess Juno; the simple Triviae or Quadruviae, who watch over crossroads (but may not be truly Celtic).

Thus the term *matres* has come to designate several types of feminine divinities who are in some instances anything but mother goddesses or protectors of fecundity. At first, prior to the identifications and multiplications, there was certainly a single feminine divinity. Described briefly by Caesar under the name of Minerva in his account of Gaulish religion, she is at once mother, spouse, sister, and daughter of the gods.

This unique goddess in multiple form may be identified, in the context of Irish myth, with a range of feminine deities. There is Brighid, daughter of Daghdha, but also mother of the gods and protector of leeches, poets, and smiths. There is Boann, who is wife to Elcmhaire but bears a son to Daghdha. Also, and preeminently, there is Édaín, sovereign and ancestor of a long line of Irish kings. Further, there is Morríghan ("the great queen"), goddess of war and wife of Daghdha, she who washes the bloody remains of heroes who have died in combat. There is Macha ("plain" or "level land"), eponym of Emhain Mhacha, capital of Ulster. There is the gentle Fann ("swallow"), wife of the god Manannán, who loves and tempts Cú Chulainn, and there is Tailtiu ("earth"), foster mother of Lugh. Finally, there are the allegorical personifications of Ireland and queens of the Tuatha Dé Danann: Ériu, Banbha, and Fódla.

CHRISTIAN-J. GUYONVARCH (1987)
Translated from French by Erica Meltzer

MATTHEW THE EVANGELIST, traditionally the author of the first canonical gospel, which bears his name. His exact dates are unknown, but the gospel was probably written in the last quarter of the first century, possibly in Syrian Antioch.

The name *Matthew* appears in every list of the twelve disciples of Jesus (*Mt.* 10:3, *Mk.* 3:18, *Lk.* 6:15, *Acts* 1:13). In the *Gospel of Matthew* Jesus calls him from his toll booth and his role as a despised tax collector to be a disciple (9:9–10), and in that gospel's list of the Twelve he is called Matthew the tax collector. Otherwise, Matthew does not appear in the gospel narratives or in the rest of the New Testament.

Mark 2:13–14 and *Luke* 5:27–28 relate the calling of a tax collector whose name is Levi, rather than Matthew (in *Mark* 2:14 he is called the son of Alphaeus; cf. "James the son of Alphaeus" in all the lists of the Twelve). Otherwise, the stories are quite similar, and in each case the call is followed by Jesus' eating at table with tax collectors and sinners and saying that he has come to call not righteous people, but sinners. (Tax collectors were regarded as egregious sinners, because the government sold the right to collect taxes to private entrepreneurs, who then realized as large a profit as possible at the expense of the public.)

The tradition of Matthean authorship of the first gospel has been questioned by critical scholarship for significant reasons. Matthew the tax collector turned disciple would have been an eyewitness of the events he narrates. Yet the close relationship between the narrative attributed to Matthew and that of Mark, which is generally accounted to be earlier, suggests that *Mark* was the principal narrative source. The fact that *Mark* was written in Greek (not Jesus and Matthew's native Aramaic) by someone who was not one of the Twelve makes it unlikely that the apostle Matthew would have relied upon it. Moreover, the gospel attributed to Matthew seems to have been written after the destruction of Jerusalem in the Roman War (70 CE; cf. *Mt.* 22:7), rather late for an apostolic writing. Quite possibly the name Matthew has been substituted for Levi in the call story of the first gospel, in which he is also singled out as the tax collector in the apostolic list.

Ancient church tradition, nevertheless, unanimously ascribes the gospel to the apostle Matthew. The fourth-century church historian Eusebius cites Papias (bishop of Hierapolis in Asia Minor during the first half of the second century)

who wrote that "Matthew collected the sayings of the Lord in the Hebrew language, and each one interpreted them as he was able" (*Church History* 3.39.16). Later church authorities attribute a gospel to Matthew, agreeing that it was written in Hebrew. Matthew is frequently said to have preached among Hebrews. Interestingly, modern gospel criticism continues to see a pervasive Jewish or Jewish-Christian dimension in Matthew's gospel, whether in its tradition or intended audience. The statement of Papias concerning Matthew's collection of Jesus' sayings has sometimes been taken to refer to an earlier source (which can be discerned in *Matthew* and *Luke* and is usually called Q by biblical scholars) rather than to the present gospel. This interpretation avoids the difficulties of attributing the gospel to the apostle directly and helps to explain why the name of a relatively obscure disciple became attached to the most prominent gospel, but it remains at best a plausible conjecture.

Legends about Matthew grew in time. He is said to have worked among Gentiles in remote lands toward the end of his career. He came to be revered as a martyr (although tradition is not unanimous on this point), and he is commemorated in the Western church on September 21. However, we know nothing for certain of his career or fate. Since the second century Matthew has been represented in Christian symbolism as a winged man, said by Irenaeus to represent the humanity of Christ.

BIBLIOGRAPHY

- Aside from the New Testament the most important primary source is Eusebius's *Church History*, which brings together earlier testimony of Christian writers on the origin and authorship of the Gospels. The most convenient edition is the two-volume "Loeb Classical Library" text and translation of Kirsopp Lake, J. E. L. Oulton, and Hugh J. Lawlor (Cambridge, Mass., 1926).
- The most important testimonies of patristic authors are collected in *The Gospel According to St. Matthew*, edited by A. H. McNeile (London, 1915), pp. xxx–xxxii. For a concise statement of the modern, critical view of Matthean authorship, see Werner G. Kümmel's *Introduction to the New Testament*, rev. ed. (Nashville, 1975), pp. 119–121. Raymond E. Brown, *Introduction to the New Testament* (New York, 1997), pp. 208–212, also rejects ascription of the Gospel of Matthew to the disciple of Jesus, although he does not dismiss Papias's attribution of a sayings collection to Matthew. The same is true of W. D. Davies and Dale C. Allison, Jr., *The Gospel According to Saint Matthew*, vol. 1 (Edinburgh, 1985), p. 17, who think there may be a connection between the collection and Matthew's Gospel.

D. MOODY SMITH (1987 AND 2005)

MĀTURĪDĪ, AL- (d. AH 333/944 CE), more fully Abū Maṣṣūr Muḥammad ibn Muḥammad ibn Maḥmūd al-Samarqandī al-Māturīdī, was a Muslim theologian, jurist, and Qur'ān commentator. The name Māturīdīyah is also

the eponym of a school of theology that represented an intermediate position between the Ḥanbalī traditionalists and the Muʿtazilah, advocates of religious rationalism in Islamic theology. Māturīdī was born in Māturīd, near the Central Asian city of Samarkand. Under the Persian Samanid rulers (874–999), al-Māturīdī lived in a setting of intense cultural and intellectual activity. He was trained by scholars of the Ḥanafī school of Islamic law. Not much is known of his life except that he wrote several books on theology, jurisprudence, and heresiology, as well as a commentary on the Qurʾān entitled *Kitāb taʾwilāt al-Qurʾān*. He is said to have led a simple and ascetic life. Some sources attribute to him miracles (*karāmāt*)—an obvious reference to his devout religious life. He died in Samarkand. Subsequent generations remember him by the honorific title Imām al-Hudā (leader of the right guidance).

Despite his fame in the Sunnī world today, no source earlier than the fourteenth century mentions a school of theology carrying Māturīdī's name. The manuals speak of the Māturīdīyah together with the Ashʿarīyah, or followers of al-Ashʿarī (d. 935), as the theological spokesmen of the *ahl al-sunnah wa-al-jamāʿah* (people of the prophetic norms and the community), the majority group in the Muslim world, commonly known as Sunnīs. Al-Ashʿarī lived in Baghdad and was a contemporary of al-Māturīdī, but there is no indication that they were aware of each other's work. Many similarities in their theological formulations have been noted. Al-Ashʿarī is much better known than his Ḥanafī counterpart, but recent studies have shown that the latter came nearer to providing a bridge between traditionalism and philosophical theology than did the Baghdad scholar. Substantial differences between the two are few, but they are sufficient to have created some rivalry between their respective schools.

The Māturīdīyah school spread in the tenth and eleventh centuries mostly due to the earnest efforts of Turks, mainly the Saljūqids, whose historic conversion to Islam had occurred in the preceding century. This was combined with the ardent support of the newly converted Turks for Ḥanafism. The famous cursing of al-Ashʿarī and his ideas in the Turkish-controlled Khorasan region on the order of the Saljūqid ruler Tughrul Beg points to a period of confrontation between the Māturīdī and Ashʿarite schools of *kalām* in the eleventh century. As the Māturīdī school was identified with Ḥanafism and Ashʿarism with the Shāfiʿī school of law, this led to some factional tensions and clashes between the Ḥanafis and the Shāfiʿīs in some Saljūqid-controlled areas. The Māturīdī school gained prominence between the eleventh and fourteenth centuries. A number of attempts were made to ease the tensions between the two schools during the Mamlūk period. The Ashʿarī Shāfiʿī jurist-theologian Tāj al-Dīn al-Subkī composed a poem in which he tried to explain away the theological differences between the two as mostly terminological and rhetorical. This trend continued in later *kalām* history and reached a point where Māturīdism was redefined as a branch of Ashʿarism.

Al-Māturīdī, like al-Ashʿarī, was firmly grounded in the Qurʾanic revelation, but he also developed a rational epistemology, giving a high place to human reasoning—a sign of his strong Ḥanafism. He was much concerned with proofs for the existence of God and with the doctrine of creation, questions that probably reflect the intellectual climate of Samarkand and the terms of his encounter with other currents of religious thought. Al-Māturīdī accepted the reality of human freedom, as against the determinism of al-Ashʿarī, but he also opposed the Muʿtazilī view of human beings as creators of their own deeds. He maintained that every act of humankind is at the same time the result of human capacity and a divine creation. Using somewhat the same language as al-Ashʿarī and as his opponents, the Muʿtazilah, he nevertheless described a balance between divine omnipotence and human freedom that was distinctive.

Even though Māturīdī was opposed to the general thrust of Muʿtazilism, he agreed with some views of the Muʿtazilites. Like the Muʿtazilites, he believed in the human ability and, in fact, obligation to know God and worship him through unaided reason even in the absence of a specific prophetic revelation. While rejecting some interpretations of the Muʿtazilites, Māturīdī accepted the necessity of interpreting anthropomorphic expressions in the Qurʾān through metaphors and symbols rather than understanding them literally. On the question of the attributes of God, he took a position opposite to the Muʿtazilites and considered divine names and qualities described in the Qurʾān to be eternally subsisting in God's essence. Like al-Ashʿarī, he affirmed the negative formula that God's names and qualities are neither identical with the divine essence nor distinct from it. He accepted the possibility of beatific vision (*ruʾyat Allāh*), that is, the idea that human beings will be able to see God in the hereafter, but he rejected the specification “by the eyes,” endorsing in some ways the famous Ḥanbalī position of “without [asking/knowing] how” (*bilā kayf*). Against al-Ashʿarī he held that faith, as the act that makes a person a member of the Muslim community, is immutable, incapable of either decrease or increase. This tenet was a part of the Ḥanafī doctrinal heritage. Furthermore, he defined faith (*al-imān*) as “consent by the heart” (*taṣdīq bi al-qalb*) and “confession by the tongue” (*iqrār bi al-lisān*). Like the Ḥanafīs and the Murjiʿas before him, Māturīdī held that works (*aʿmāl*) are not part of the doctrinal confession of faith.

BIBLIOGRAPHY

The most comprehensive work on Māturīdī and his school is Shams al-Dīn Salafī Afghānī's *al-Māturīdīyyah*, 3 vols. (Taʾif, Saudi Arabia, 1998), in which the author analyzes Māturīdī's thought and its subsequent development. Mustafa Cerić provides a systematic analysis of Māturīdī's thought in *Roots of Synthetic Theology in Islam: A Study of the Theology of Abū Manṣūr al-Māturīdī* (Kuala Lumpur, 1995). Fathallah Khulayf prepared a critical edition of *Kitāb al-tawḥīd* (Beirut, 1969), thus making available for the first time the printed Arabic text of al-Māturīdī's most important existing theological work. The editor has provided a 43-page

introduction in English, describing in an incomplete and somewhat unsystematic way the contents of *Kitāb al-tawḥīd* W. Montgomery Watt furnishes a brief introduction to the Ḥanafī theologian in *The Formative Period of Islamic Thought* (Edinburgh, 1973), pp. 312–314; reprint, Oxford, 1998. Michel Allard provides a more detailed summary and discussion of the contents of *Kitāb al-tawḥīd* in *Le problème des attributs divins dans la doctrine d'al-As'ari et de ses premiers grands disciples* (Beirut, 1965), pp. 419–427. A section of Daniel Gimaret's *Théories de l'acte humain en théologie musulmanée* (Paris, 1980), pp. 175–190, deals in a perceptive and detailed way with the discussion in *Kitāb al-tawḥīd* concerning the relationship between human acts and divine sovereignty. Hans Daiber provides a discussion of *Kitāb al-tawḥīd* in "Zur Erstausgabe von al-Māturīdī, *Kitāb al-Tawḥīd*," *Der Islam* 52 (1975): 299–313.

Muḥammad Ibrāhīm Fayyūmī's *Ta'rikh al-firaq al-islāmīyah al-siyāsī wa-al-dīnī* (Cairo, 2003) contains an extensive chapter on Māturīdī and his school. Another monograph on Māturīdī's life and thought is Balqāsīm Ghālī's *Abū Mansūr al-Māturīdī: ḥayātuhu wa āra'uhu al-aqdiyah* (Tunis, Tunisia, 1989). Saim Yeprem's *İrade Hürriyeti ve İmam Māturīdī* in Turkish (Istanbul, 1984) is a detailed survey of Māturīdī's concept of free will and determinism. Kemal Işık's *Māturīdī'nin Kelam Sisteminde İman, Allah ve Peygamberlik Anlayışı* (Ankara, Turkey, 1980), another monograph in Turkish, deals with the concepts of faith, God, and prophethood in Māturīdī's system.

Even though somewhat outdated, A. K. M. Ayyub Ali's chapter on the life, thought, and influence of al-Māturīdī in *A History of Muslim Philosophy*, vol. 1, edited by M. M. Sharif, pp. 259–274 (Weisbaden, Germany, 1963), is based on an examination of *Kitāb al-tawḥīd*, existing only in manuscript at the time, and *Ta'wīlāt al-qur'ān*, al-Māturīdī's multivolume commentary on the Qur'ān. The latter, existing in several manuscript copies, was described for the first time by Manfred Götz in an article, "Māturīdī und sein *Kitāb Ta'wīlāt al-Qur'ān*," *Der Islam* 41 (1965): 22–70. The most extensive study of the spread of Maturidism is Wilferd Madelung's "The Spread of Maturidism and the Turks," in *Actas do IV Congresso de Estudos Arabes e Islamicos Coimbra-Lisboa 1968* (Leiden, 1971), pp. 109–168. See also his two entries "al-Māturīdī" and "Māturīdīyyah," in the *Encyclopedia of Islam*, 2d ed., vol. 4, edited by C. E. Bosworth et al., pp. 846a–847a (CD-ROM edition, Leiden, 2003). Ulrich Rudolph's *Al-Māturīdī und die sunnitische Theologie in Samarkand* (New York, 1996) places Māturīdī and his thought in a historical context. There is also a short commentary on Abū Ḥanīfā's *Fiqh al-akbār* attributed to Māturīdī.

R. MARSTON SPEIGHT (1987)
IBRAHIM KALIN (2005)

MĀUI is the most versatile, popular, and widely known supernatural hero in South Pacific mythology. Islanders as far west as the Micronesian island of Yap narrate how Māui, with his enchanted fishhook, pulled up a big "fish": an island complete with people, villages, and gardens of new food plants. Māui is, however, primarily a Polynesian hero; inhab-

itants of every island from Hawai'i to New Zealand and from Mangareva to Tonga and Samoa narrate versions of his exploits in separate myths or unified myth cycles. In the traditional culture, islanders recited his spells for success in their mundane lives; priests converted secular, humorous myths about Māui to their own serious purposes.

Māui is not only the earth-fisher but also the Polynesian sun-snarer, sky-raiser, fire-stealer, monster-slayer, seeker of immortality, and, in fact, the hero of so many mischievous exploits that Tuamotuans nicknamed him Maui-of-a-Thousand-Tricks and Tupuatupua ("super-superman"). To Hawai'ians he was *āiwaiwa* ("wonderful") because he was marvelously skilled, yet weird, bad, and notorious. His best-known cognomen, Maui-tikitiki-a-Taranga (or cognates), originated, the New Zealand Maori claimed, when his mother, Taranga, wrapped him—her last born and a miscarriage—in a topknot (*tikitiki*) of hair and cast him with a prayer into the ocean. Ocean and sky gods rescued and reared him until, as a boy, he rejoined his family. His tricks finally ended when he entered the womb of the sleeping goddess Hine-nui-te-po ("great Hine of the underworld") in order to gain immortality. He intended to depart through her mouth, but when his bird companion laughed at the sight, the goddess awoke and crushed Māui to death.

Māui was a shape-shifting trickster and, usually unintentionally, a culture hero. He was also the quintessential demigod, neither wholly god nor wholly man, a misfit, who continually tested his magic and *mana* against the cosmogonic gods and against his father and elder brothers in his attempts to usurp their privileges, to humiliate them, and to demonstrate his superiority. He was also a bridge in time between the ending of the era of creation and the beginning of the era of human migrations.

Polynesians believed that by using his incantations and referring to his deeds they would sanctify their work and, at its conclusion, lift taboos on the workers. New Zealand provides the clearest examples of this. A priest of bird-catching rituals regarded the sun as a great bird and would chant Māui's sun-snaring spell to ensure a good catch. To kindle sacred new fire he would recite the incantation by which Māui had overpowered the fire deity and learned to make fire. A priestly expert on the ceremonies accompanying the planting and harvesting of *kumara* (sweet potato) would chant Māui's "song of plenty" over a feather-ornamented, crescent-topped digging stick. The song recalled how Māui, in the guise of a pigeon, had perched on his father's stick after having sneaked after him to his underworld sweet potato garden. Using Māui's charm, fishermen would weaken a large fish's reluctance to leave the ocean, and hostile invaders would recite it to unnerve people and force them to leave their homes. High priests who had been influenced by Western religion rejected the common version of the earth-fishing story and divulged its esoteric, "real" meaning. The high god Io, they explained, gave Māui, his brothers, and their descendants—the Maori—possession of the earth (i.e., New Zealand).

Wherever Māui was known he was claimed as an ancestor. In the Hawai'ian Islands the claim received royal recognition in the genealogical prayer chant, the *Kumulipo* ("source in deepest darkness"), which belonged to the family of King Kalakaua (1836–1891) and his sister Queen Lili'uokalani (1838–1917), and which described the family's descent from the time of primary gods to that of deified chiefs. Eighteen lines of the fifteenth of the sixteen chants comprising the *Kumulipo* cryptically list the principal events in Māui's life. The sixteenth chant opens with the names of Māui and his wife and ends with that of Lono-i-ka-makahiki. High chiefs once intoned this two-thousand-line prayer to consecrate an infant sacred chief; they gave him the revered name of Lono-i-ka-makahiki and activated his *mana* by naming his ancestors (who included spiritualized natural phenomena, cosmogonic gods, demigods like Māui, and deified chiefs). In 1778, high chiefs chanted the *Kumulipo* over Captain James Cook, welcoming him as a returned god whose name, like the sacred child's, was Lono-i-ka-makahiki.

Priests exploited Māui for several reasons. To Society Islands priests, Māui was a submissive helper who raised the low-lying sky and regulated the time of the sun's journey to enable his eldest brother, a priest, to build temples. In Rarotonga in the Cook Islands, high priests interpreted Māui as a giant who, the first time he stood up, pushed up the sky with his head; later Māui became the weary avenger of insults made by other gods against Tangaroa, his foster father.

References to worship of Māui are obscure, rare, and based on unsupported hearsay. Tongans, it is said, formerly had a shrine and priest of Māui. One Hawai'ian priest declared that Hawai'i had long ago had a Māui cult and priests; another informant stated that Kamehameha I had built a temple to honor Māui. Most Polynesians usually respected Māui as an ancestor, despite his tricks, and they appreciated the benefits derived from his craftiness. But rather than to worship him, it seems that they preferred simply to enjoy the stories of how he humiliated many senior gods and earthly elders.

- Luomala, Katharine. *Oceanic, American Indian, and African Myths of Snaring the Sun*. Honolulu, 1940. A detailed study of the distribution and versions of sun-snaring myths in three parts of the world.
- Luomala, Katharine. *Māui-of-a-Thousand-Tricks: His Oceanic and European Biographers*. Honolulu, 1949. The most comprehensive general survey to date on Māui in Oceanic culture, the major myth cycles that interpret his character and exploits, and the many theories of European scholars about him.
- Luomala, Katharine. *Voices on the Wind: Polynesian Myths and Chants*. Honolulu, 1955. Includes a chapter on Māui and,

with chapters on other heroes and on Polynesian narrative art, puts him in a broad setting.

KATHARINE LUOMALA (1987)

MAURICE, FREDERICK DENISON (1805–1872), Anglican theologian, founder of Christian Socialism. John Frederick Denison Maurice was born near Lowestoft, Suffolk, England, the only son of a Unitarian minister, Michael Maurice, and Priscilla Hurry Maurice. Childhood memories of bitter family religious dissension (his mother and three older sisters abandoned Unitarianism for a form of Calvinism) left the young Frederick with a thirst for unity that was to motivate him all his life.

At Cambridge from 1823 to 1826, Maurice was influenced by Coleridge. During his intense conversion experience beginning in 1828, Maurice was deeply affected by the Scottish theologians Edward Irving (1792–1834) and Thomas Erskine (1788–1870). He decided to read for holy orders as an undergraduate, this time at Oxford, and was rebaptized and ordained in the Church of England in 1834.

At the core of this experience was Maurice's desire to know God directly as an actual, living person, in contrast to the abstract God of the Unitarians. This was not merely a romantic reaction to Western rationalism, but the discovery of a biblical, Christocentric, Pauline worldview, the great paradox of Christian faith, in which the holy and invisible God was at the same time in the person of a man. For Maurice, the fundamental, unchanging relationship at the heart of reality was that between God as revealer and man, the creature formed to know God. Man as the receiving image possesses no nature or life of his own. Man's sin is his assertion of independence, his striving hard not to be a receiver. Christ, the perfect image of the Father, is the image after which man was created. Christ is in every man, but the condemnation of every man is that he will not believe or act as if this were true. Maurice found the objective structure of this subjective faith in the articles, creeds, and liturgy of the English church. These formed a permanent witness to the fact that God had established a spiritual and universal kingdom on earth.

Maurice applied this worldview consistently to what he perceived as the basic need of his time: the rediscovery of revelation as the ground of faith. A divine-human struggle has marked all human history through man's distortion or denial of God's revelation. Instead of receiving and living within the given, divine order or constitution of the universe, man has been busily creating theories, systems, and opinions of his own as substitutes. These have resulted in the fragmentations of religious and political sects, parties, and factions and in philosophical attempts to bring heaven and earth within the terms of the intellect, Hegel being the latest offender. Maurice's method was the reverse: to be a digger, uncovering the original purpose and intent of all institutions, in order to

show they were meant to be signs to the world of something invisible and permanent, the lineaments of an actual, existing kingdom of Christ.

In his writings, Maurice deliberately took the offensive, impelled by an urgent sense that a serious crisis of faith was growing among the young and that what passed for religion was a perversion of the Judeo-Christian faith that could not win their allegiance. His experience with young men was considerable: with medical students as chaplain of Guy's Hospital, London (1836–1845); as professor of English literature and history and then of theology (1840–1853) at King's College, London; with law students as chaplain of Lincoln's Inn, London (1846–1860). His luminous personal qualities and passionate devotion to truth attracted a growing circle of young men who were deeply influenced by him. These close contacts increased his concern about their questionings and doubts. They were being dosed with religion about God rather than with the living God himself: "Religion against God: this is the heresy of our age."

The revolutions of 1848 and the potentially explosive social situation in England found Maurice as spiritual leader of the short-lived but significant Christian Socialist movement (1848–1854), together with John Malcolm Ludlow (1821–1911) and Charles Kingsley (1819–1875). Convinced that cooperation, not competition, was the true foundation of a Christian society, their practical focus became that of cooperative associations for tailors and other trades. For Maurice the kingdom of Christ was the actual constitution of the universe, the "great practical existing reality which is to renew the earth." Society was not to be made anew but regenerated through uncovering its true functions and purpose, a view opposed to Ludlow's aim for reorganizing society on a socialist base. Maurice's interest in the education of the young was extended through his experience with workers, resulting in the founding in London of the Working Men's College (1854) to express his conviction that the true ground of human culture was not utilitarian but theological, the original purpose for which the ancient universities had been founded. His concern to set high standards for the education of governesses led to the founding of Queen's College, London, early in 1848.

Negative reactions to Maurice's theological and social views and to his growing influence reached a climax with the publication of his *Theological Essays* in 1853. These essays were written with the doubts and questions of the young in mind, as an alternative to the prevailing evangelical orthodoxy, which presented only theories and systems about God, Judgment Day, the verbal inspiration of the Bible, and everlasting punishment. This last Maurice viewed as a cosmic struggle between two eternal opposites: eternal life, which God presents to man, and eternal death, which man chooses for himself. But Christ's gospel reveals an abyss of love below that of death. This view was interpreted by the religious press as a denial of everlasting punishment and led finally to Maurice's expulsion from King's College in 1853 for unsettling the minds of the young.

Despite such controversies, increasing recognition and acceptance came to Maurice in his lifetime and he is viewed today as one of the most original thinkers of the Church of England. His permanent influence remains that of a prophet whose writings formed a sustained, passionate critique of the religious world of his time, comparable in depth to that of Søren Kierkegaard in the nineteenth century and of Karl Barth in the twentieth.

BIBLIOGRAPHY

Works by Frederick Denison Maurice

The Life of Frederick Denison Maurice Chiefly Told in His Own Letters, edited by his son, Frederick Maurice (London, 1884), is a major source for understanding Maurice's thought. For a selection of the letters, see *Toward the Recovery of Unity*, edited by John F. Porter and William J. Wolf (New York, 1964). Characteristic themes appear in his early work *The Kingdom of Christ, or, Hints on the Principles, Ordinances, and Constitution of the Catholic Church in Letters to a Member of the Society of Friends* (1838; revised, London, 1842). A new edition by Alec Vidler, based on the 1842 edition, has been published in two volumes (London, 1958). The post-Reformation religious bodies—Protestant, Roman Catholic, and Anglican—have turned their true principles into separate systems and theories, thereby losing sight of that church universal that existed before these systems and whose signs are indicated in the book's title. A variation of this theme is applied to the history of philosophy in *Moral and Metaphysical Philosophy: Philosophy of the First Six Centuries*, 2 vols., 2d ed., rev. (1854; reprint, London, 1872), begun in 1835, which contrasts man's independent search for wisdom with that Wisdom that first sought him. A lengthy controversy over Henry L. Mansel's Bampton Lectures of 1858 resulted in an important statement of the actual revelation of God to man presented in two works: *What Is Revelation? A Series of Sermons on the Epiphany* (Cambridge, 1859) and *A Sequel to the Inquiry, What Is Revelation?* (Cambridge, 1860). Some of the flavor of Maurice's views on Christian Socialism may be gleaned from *Politics for the People*, weekly papers from May through August 1848 (London), and *Tracts on Christian Socialism* (London, 1850).

Works on Frederick Denison Maurice

Among the works by the many distinguished twentieth-century Anglicans interested in Maurice, Alec Vidler's pioneering study *Witness to the Light: F. D. Maurice's Message for Today* (New York, 1948), his later *F. D. Maurice and Company* (London, 1966), and Arthur M. Ramsey's *F. D. Maurice and the Conflicts of Modern Theology* (Cambridge, 1951) are outstanding. Frank M. McClain's *Maurice: Man and Moralist* (London, 1972) is a perceptive account of how Maurice's personal relationships shaped his outlook on those givens of the Kingdom: the self, the family, the nation, and the church as universal society. My own *Frederick Denison Maurice: Rebellious Conformist* (Athens, Ohio, 1971) is a historical study emphasizing the centrality of Maurice's conversion from Unitarianism to Anglicanism and assessing his stature as a major Victorian figure. The Danish scholar Torben Christensen's *The Divine Order: A Study of F. D. Maurice's Theology* (Leiden, 1973) is a detailed analysis of Maurice's thought as a fusion of the message of the Bible and the Platonic idea

of reality, in which Christianity is adjusted to Platonism. See also his excellent critical work *Origin and History of Christian Socialism, 1848–1854* (Aarhus, 1962).

OLIVE J. BROSE (1987)

MAUSS, MARCEL (1872–1950), the father of French ethnography, has had a profound influence on human and social sciences and has left behind an incredibly rich intellectual legacy. He is automatically linked with his uncle and teacher, Émile Durkheim (1858–1917). Some would say that he was “in the shadow of Durkheim” when describing his scholarly output, produced in direct cooperation with him.

Born to a family of merchants and rabbis at Épinal in 1872, Mauss studied philosophy at Bordeaux under Durkheim. After gaining his *agrégation* (teaching exam) in philosophy in 1895, he gave up the standard career path of secondary teaching, turning his attention instead to sociology of religion. During his studies at the École Pratique des Hautes Études and a trip to Holland and England, he also gained a solid grounding in philology, the history of religions, and ethnology. From his university days Mauss was also politically active, supporting Dreyfus and the socialists. He worked with the *Mouvement socialiste* and he took part in founding the new *Société de librairie et d'édition* with Lucien Herr and Charles Andler. Once he became a professor, Mauss was involved in the cooperative movement and the Socialist Party and published numerous articles in *L'Humanité*, of which he had been one of the founders.

Marcel Mauss produced his first major work together with his friend and colleague Henri Hubert (1872–1927), titled “Essai sur la nature et la fonction du sacrifice” (1899) [Essay on the nature and function of sacrifice]. The essay appeared in *L'Année sociologique*, which Durkheim had just founded in 1898. In charge of the section on religious sociology, Mauss was one of its leading contributors. At the École Pratique des Hautes Études, where he succeeded Léon Marillier in 1901, Mauss was responsible for teaching the history of the religion of primitive peoples. Frequently comparative and backed up with detailed evidence, the research undertaken by Mauss was set out as part of a program that had as its subject the ritual expressions of religious life and as its purpose the development of a theory of the sacred. His work quickly went beyond the boundaries of the sociology of religion to deal with the theory of knowledge, as can be seen from the essay written with Durkheim, titled “Quelques formes primitives de classification” (1903) [Some primitive forms of classification]. Concerning sociology, the supporters of Durkheim were quick to point out that it was a collective psychology with the purpose of studying collective representation.

The main debate in Durkheim’s first books at the end of the nineteenth century revolved around the conflict be-

tween the individual and society, one of the problems faced by sociology since its inception being its specific nature and its relation to other disciplines, particularly psychology. This debate not only pitted Durkheim against his opponents, such as Gabriel Tarde, it also divided his colleagues, as can be seen from the initial volumes of *L'Année sociologique*. Célestin Bouglé, who, like his friend Paul Lapie, was undecided regarding the theoretical framework proposed by Durkheim, recognized the role of the individual and sought to go beyond the conflict between the individual and society, talking of interaction, association between individuals, communication of conscious awareness.

In the work of Mauss was the intention to soften the dogmatic tone of Durkheim. In an essay titled “Sociologie” [Sociology] which he co-authored with Paul Fauconnet in 1901 for *La Grande Encyclopédie*, he stressed the psychological aspect of social life, beliefs and communal feelings. “The very core of social life is a collection of representations,” he wrote. “In this sense then, it could be said that sociology is a kind of psychology . . .” (Mauss, 1901). He clearly means a psychology different from that of the individual. Together with Henri Hubert, in 1904 Mauss published in *L'Année sociologique* the important “Esquisse d’une théorie générale de la magie” [Outline of a general theory of magic], demonstrating that here the laws of collective psychology transgress the laws of individual psychology. “It is belief that creates the magician,” they wrote, “and the effects he unleashes” (Mauss, 1904). The use of the concept of *mana*, as the source idea of magic, stirred up a long-lasting controversy.

After the First World War, a tragedy which resulted in the death of Durkheim, his son André and several contributors to *L'Année sociologique*, and during which Mauss had volunteered and served as an interpreter, the latter undertook the difficult task of replacing his uncle and he attempted to relaunch *L'Année sociologique*, but only two volumes appeared, in 1925 and 1927. He also kept up intense political activity, undertaking the editing of an important work on the State and, after publishing his “Observations sur la violence” [Observations on violence] in *Vie socialiste*, he planned a book on Bolshevism. Then, encouraged by the current exoticism, which was attracting a new public to ethnology, Mauss worked together with Lucien Lévi-Bruhl and Paul Rivet, and in 1925 he set up the Institut d’ethnologie de l’université de Paris. The Institute attracted many students and researchers—Jeanne Cuisinier, Alfred Métraux, Marcel Griaule (1898–1956), Georges Dumézil (1898–1986), Denise Paulme, Michel Leiris, Germaine Dieterlen, Louis Dumont, André-Georges Haudricourt, Jacques Soustelle, Germaine Tillion, and others—who led many field studies, particularly in Africa, and organized the first important ethnological expeditions.

A man of tremendous intellectual curiosity and exceptional erudition, Mauss undertook research in a large number of areas: from magic, to body technique via the idea of the individual, he rectified the anti-psychological attitude of

his uncle. Mauss set new “Rapports réels et pratiques de psychologie et de la sociologie” [Real and practical relationships of psychology and sociology], in an article which he published in 1924 in *Journal de psychologie*. The following year, he published in the new series of *L'Année sociologique*, his “Essai sur le don. Forme et raison de l'échange dans les sociétés archaïques” [Essay on the gift. The form and reason of exchange in archaic societies].

Durkheim's nephew had never before been so interested in concerning himself with work undertaken by psychologists, and he took part in the projects of the Société de psychologie, becoming its president in 1923. His friends included Charles Blondel, Georges Dumas and above all Ignace Meyerson, the managing editor of the *Journal de psychologie normale et pathologique*. “Sociology, psychology, physiology, everything should be combined,” wrote Mauss. The intention is thus to take as a subject “the entire, actual human being” and to analyze “the phenomena as a whole.” In 1936 then, again in the *Journal de psychologie*, he published a study on the “Effet physique chez l'individu de l'idée de mort suggérée par la collectivité” [“Physical effect upon the individual of the collectively suggested idea of death”]. Mental confusion, inhibitions, delusions, and hallucinations were all phenomena in which Mauss had a keen interest, but which, contrary to the opinions of psychologists, he did not perceive as pathological symptoms.

Marcel Mauss was elected to the Collège de France in 1930 and he became head of sociology. The texts he published at this period include “Les techniques du corps” [Body techniques] which appeared in 1935 in the *Journal de psychologie*, and “Une catégorie de l'esprit humain: la notion de personne, celle de « moi », un plan de travail” [A category of the human spirit: the idea of the person, the idea of 'self a plan], in the *Journal of the Royal Anthropological Institute*. His last academic presentation was in 1941 and consisted of the paper, “Les techniques et la technologie” [Techniques and technology], delivered to the Journée de psychologie et d'histoire du travail et des techniques organized in Toulouse in 1941 by Ignace Meyerson. Marcel Mauss died on February 11, 1950, aged sixty-seven.

Mauss's writings were first collected by Claude Lévi-Strauss in 1950 in *Sociologie et anthropologie*, then in 1969, by Victor Karady in three volumes, *Ceuvres*. As for his extensive *Écrits politiques*—Mauss was a very active militant socialist—they were only collected by Marcel Fournier in 1997. The political work of Mauss consists of a large number of reflections and invaluable “reflections” where he combines and expresses, as he recognizes himself, the fervor of the scholar and the politician. He had no doubt at the end of his “Essai sur le don” [Essay on the gift] concerning the worth of ancient moral values, such as charity, and he put forward a morality based upon solidarity and reciprocity.

MARCEL FOURNIER (2005)

MĀWARDĪ, AL- (AH 364–450/974–1058 CE), more fully Abū al-Ḥasan ‘Alī ibn Muḥammad ibn Ḥabīb; Muslim

jurist and political theorist. Al-Māwardī was born in Basra but spent most of his life in Baghdad. He studied Islamic law in both cities with eminent legists of the Shāfi'ī school of jurisprudence. Because of his reputation as a scholar, he was appointed judge in several towns, including Ustuwā in Iran and Baghdad in Iraq. In Baghdad the caliph al-Qādir (991–1031) chose him to write a resumé of Shāfi'ī jurisprudence; al-Qādir's successor, al-Qā'im (1031–1074), used al-Māwardī for diplomatic missions to the Buyid and Seljuk rulers of Iran.

Although al-Māwardī is remembered primarily as the author of *Kitāb al-ahkām al-sultānīyah* (Book of governmental ordinances), he wrote other books on jurisprudence and government, as well as treatises on such varied topics as Qur'anic exegesis, the prophethood of Muhammad, the conduct of judges, proverbs and traditions, and Islamic ethics. The report that he did not permit circulation of his books until after his death is regarded as apocryphal. While his book on ethics, entitled *Kitāb adab al-dunyā wa-al-dīn* (Book of manners in worldly and religious affairs), is still read by Muslims, it is seldom taken into account in discussions of al-Māwardī's importance in the development of Islamic thought; surprisingly enough, the same holds true even for his works closely related in subject matter to *Al-ahkām*. Accordingly, in the absence of any comprehensive study of al-Māwardī's complete works, estimates of his significance must be regarded as tentative despite the fact that the place assigned him in political thought by Western scholars is firmly fixed and widely accepted.

The date of composition of *Al-ahkām* is not known, nor is the nature of the relationship of this book to a similar, in many respects identical, book of the same title written by al-Māwardī's contemporary, the Ḥanbalī jurist Abū Ya'lā ibn al-Farrā'. However, scholars assume, without documentation, that since al-Māwardī's *Al-ahkām* seems to be a mature work, it must have been written toward the end of his life; since, moreover, al-Māwardī was sixteen years older than Ibn al-Farrā', it is believed that the latter must have borrowed, without acknowledgment, from the former. Clearly these are problems that need to be solved before al-Māwardī's originality and development as a thinker can be understood. In the meantime, an indication of the content of *Al-ahkām* and its possible connection with the author's milieu must suffice.

According to al-Māwardī he wrote *Al-ahkām* at the behest of a ruler, perhaps a caliph, as a convenient compendium of ordinances relating to government, culled from manuals of jurisprudence. This work, and Abū Ya'lā's, are rightly regarded as the first books of jurisprudence to be devoted exclusively to the principles and practice of Islamic government. The parts of *Al-ahkām* that have attracted most attention discuss the three highest offices of the medieval Islamic state: the caliphate, the vizierate, and the emirate by usurpation, even though at least two-thirds of the work is devoted to lesser administrative and judicial offices, taxation, and

land policy. Scholars are divided as to whether the book, either as a whole or in parts, reflects actual political conditions prevailing in al-Māwardī's time or constitutes a program for establishing an ideal state or for reasserting the power of the caliphate in the face of threats posed by secular, military rulers. The prevailing view is that al-Māwardī was a supporter of al-Qā'im and al-Qādir in their struggle against the Buyids and the Seljuks. His support, never explicitly expressed as such, came in the form of arguments derived from the Qur'ān, tradition (*ḥadīth*), and jurisprudence (*fiqh*) for the necessity of maintaining the caliph as executor of Islamic law and for the duty of the Muslim community to obey him. Admittedly, this dual principle seems remote from the realities of al-Māwardī's day, when generals exercised political power in Islamic states. But al-Māwardī tried to come to terms with this reality and to accommodate it within the scope of Islamic law in his chapter on the emirate by usurpation. There he argued that rule by emirs based on force was to be sanctioned as long as they acknowledged the authority of the caliphs and implemented Islamic law. In effect, such an admission constituted a first step toward concession to political expediency, which was characteristic of the subsequent development of medieval Islamic political thought. Be that as it may, al-Māwardī's formulation of the character of the Islamic state has been regarded as authoritative by many Muslim thinkers and Western scholars alike.

BIBLIOGRAPHY

The fullest published study of al-Māwardī is the long article by Henri Laoust, "La pensée et l'action politiques d'al-Māwardī," *Revue des études islamiques* 36 (1968): 11–92. I discuss problems that Laoust does not treat in my article "A New Look at *al-ahkām al-Sultānīyya*," *Muslim World* 64 (January 1974): 1–15. *Al-ahkām al-sultānīyah* has been translated into French by Edmond Fagnan as *Les statuts gouvernementaux* (Algiers, 1915).

DONALD P. LITTLE (1987)

MAWDŪDĪ, SAYYID ABŪ AL-A'LĀ (1903–1979), popularly known as Mawlānā Mawdūdī; Indian (later Pakistani), writer, religious thinker, political figure, and founder and leader of an Islamic revivalist movement. Mawdūdī was born into a religious family in Aurangabad, British India. With the exception of a short period in a Hyderabad *madrasah*, his education was gained at home or through his own efforts. His earliest occupation was journalism, and in 1920 he became editor of the highly influential newspaper of the Jam'iyat-i 'Ulamā' (the organization of Indian 'ulama'), where he remained for seven years. As one of the Indian Muslim leaders outraged by Gandhi's abandonment of the Swarāj movement for independence, he began to argue that Muslim interests could not be reconciled with those of Hindus. Although Mawdūdī had participated in the religio-political Khilāfat movement, he and his brother criticized the Khilāfat leaders for the fiasco of the *hijrah* ("emigration") movement from India to Afghanistan.

In the mid-1920s, in response to Hindu attacks on Islam resulting from the murder of a Hindu leader by a Muslim fanatic, Mawdūdī wrote a series of articles in defense of Islamic beliefs, subsequently published as *Al-jihād fī al-Islām* (Religious War in Islam). He later said that this volume, his first serious work on Islam, represented his true intellectual and spiritual conversion to the religion.

Mawdūdī left journalism in 1927 for literary and historical pursuits. In the following years he wrote a history of the Seljuks and an unfinished history of the Asafī dynasty of Hyderabad. From 1932 he was associated with a Hyderabad religious journal, *Tarjumān al-Qurʾān*, which he edited from 1933 until his death; this publication has been the principal instrument for the propagation of his views. Criticizing the westernized class of Indian Muslims, Mawdūdī began to call for the mobilization of Muslims in the cause of Islam. In the political debates of the late 1930s he rejected both the Indian nationalism of the Congress and the Muslim nationalism of the Muslim League, calling instead for an Islamic order in India. His views from the period are collected in three volumes called *Musalmān aur mawjūdah siyāsī kashmakash* (The Muslim and the Present Political Struggle).

In 1941 Mawdūdī founded the Jamāʿat-i Islāmī, an organization for the promotion of Islamic principles, and was elected its chief, or *amīr*, which he remained until 1972. From 1941 until the partition of India he devoted his time to building the organization and to writing. In 1947, despite his unhappiness with the Muslim League, Mawdūdī moved to Pakistan, where he and his group became the leading spokesmen for an Islamic state. The Jamāʿat-i Islāmī sought political power, and its activities attracted the disapproval of government. Mawdūdī and his principal followers were imprisoned on several occasions; he himself was condemned to death by a military court after the anti-Aḥmadīyah disturbances of 1953, but the sentence was never carried out. His ideas and activities brought criticism from both modernist and conservative Muslims as well as from secularists.

Mawdūdī's teachings are set out in a large number of writings that include a six-volume commentary on the Qurʾān, *Tafhīm al-Qurʾān*. These writings have been translated into numerous languages, and he is at present one of the most widely read authors in the Islamic world. He believed Islam to be an ideology that offers complete guidance for human life, laid down by God in his holy book, the Qurʾān, and through his prophet, Muḥammad. The task of Muslims is to follow the eternal divine law by building an Islamic state, by creating an Islamic society as well as an individual Islamic life. The paramount feature of his teaching is the demand for an Islamic state, which he intended to be realized in the form of the Jamāʿat-i Islāmī. His vision of society was rigorous, puritanical, authoritarian, antiseccular, and antidemocratic but was based upon a deeply held conviction that people must live according to the law of God.

BIBLIOGRAPHY

A sympathetic discussion of the import of Mawdūdī's perspective for many aspects of life is *Islamic Perspectives: Studies in Honor of Mawlana Sayyid Abul Aʿlā Mawdudi*, edited by Khurshid Ahmad and Zafar Ishaq Ansari (Leicester, 1979). Kalim Bahadur's *The Jamāʿat-i Islāmī of Pakistan* (New Delhi, 1980) is informative as to the history of that organization. Leonard Binder's *Religion and Politics in Pakistan* (Berkeley, 1963) gives the Pakistani background. Charles J. Adams's "The Ideology of Mawlana Mawdudi," in *South Asian Politics and Religion*, edited by Donald Smith (Princeton, 1966), pp. 371–397, is a balanced account; see also his "Mawdudi and the Islamic State," in *Voices of Resurgent Islam*, edited by John Esposito (New York, 1983), pp. 99–133.

SHEILA McDONOUGH (1987)

MAWLID is an Arabic word that literally means the time and place of a birth, but the word is used in particular for the birth of the prophet Muḥammad (*mawlid al-nabī*). In some Islamic countries it also refers to the festival days of local saints (*walīs*). The actual birth date of the prophet Muḥammad is unknown, but the anniversary of his birth is celebrated on 12 Rabīʿah al-Awwal of the Islamic lunar calendar, a day prior to the anniversary of his death (in 632 CE).

Muḥammad is portrayed in the Qurʾān as a messenger of God who was an ordinary mortal in other respects. Only in later centuries did many Muslims begin to assert a higher sanctity for his person. The first recorded celebrations of his birth occurred during the latter part of Fatimid rule in Egypt (909–1171). As Shīʿī Muslims who held descendants of the Prophet in particularly high esteem, the Fatimid elite similarly observed the *mawliids* of Muḥammad's son-in-law ʿAlī, his daughter Fāṭimah, and the reigning caliph. Palace dignitaries and religious notables held daylight processions and delivered sermons, a practice briefly prohibited but later revived. The Sunnī majority in Egypt took no part in these ceremonies.

The first popular *mawlid* occurred in 1207. Muẓaffar al-Dīn Kökbürü, brother-in-law of the famed Ṣalāḥ al-Dīn (Saladin), arranged for a festival in Arbalāʾ, a town near Mosul in present-day northern Iraq. As described by the historian Ibn Khallikān (d. 1282), a native of the town, the *mawlid* became an elaborate annual event, attracting scholars, notables, preachers, and poets from throughout the region. The deeds and person of Muḥammad were celebrated in religious poetry and songs and culminated on the eve of the *mawlid* in a torchlight procession led by the prince. Followers of Ṣūfī orders were also prominent in the celebrations, and gifts were lavishly distributed to participants.

Some aspects of early *mawliids* appear to have been influenced by Middle Eastern Christian traditions of the period, such as lavish entertainments and nighttime processions in honor of saints. Even as *mawliids* also developed for saints

and other holy persons, especially in Egypt, the Prophet's *mawlid* continued to be the most elaborate. *Mawlid*s quickly became highly popular occasions associated with mysticism, during which Ṣūfī orders congregated in public, reciting rhythmical chants in praise of God and in some cases entering into trance. From Egypt, *mawlid*s spread to many other parts of the Islamic world.

The popularity of *mawlid*s met initial resistance from some theologians. Ibn Taymīyah (d. 1328) and others condemned the Prophet's *mawlid* as a harmful innovation (*bid'ah*). After considerable discussion, most theologians, except those precursors of the later Wahhābī movement, who espoused Islam in its most idealized and fundamental form, tolerated the *mawlid* as a praiseworthy innovation (*bid'ah ḥasanah*), since it inspired reverence for the Prophet. The central activity of *mawlid*s is the recital of long panegyric poems and legends commemorating Muḥammad and his deeds, recitations so popular that they are repeated on festive occasions throughout the year.

The acceptance of popular practice by theologians shows the Islamic principle of consensus (*ijmā'*) at work. A key doctrinal tenet in Islam is that the community of believers cannot agree upon error. The legal opinions of religious jurists appear to have had minimal influence in reducing the popularity of *mawlid*s, so that most jurists were encouraged to accommodate theological doctrine to social realities.

As with other Islamic celebrations and rites of passage, *mawlid*s show considerable differences throughout the Islamic world. In some contexts, the *mawlid* is minimally distinguished from other festive occasions; elsewhere, it is one of the most important annual religious events. In nineteenth-century Cairo, *mawlid* celebrations started on the first day of Rabī'ah al-Awwal. Large tents were pitched in one of Cairo's quarters and decorated with lamps and Qur'anic inscriptions. Each night Ṣūfī orders carried their banners in procession to their tents, where they chanted the name of God, recited poems in praise of Muḥammad, and provided refreshments to guests. In the daytime, dancers, clowns, and storytellers entertained the audience in a carnival atmosphere. Festivities climaxed on the eleventh and twelfth evenings of the month, with elaborate poems and songs in praise of Muḥammad that continued until morning. In recent times government restrictions against large public gatherings sought to curtail these events. Nonetheless, the Prophet's *mawlid* and to a lesser extent those for local saints continue to be large communal festivals attracting hundreds of thousands of people in Egypt's larger towns.

Elsewhere in the Islamic world, religious orders play a less central role in *mawlid* festivities. In Morocco, the month in which the Prophet's birthday occurs is popularly known as *mulūd*, the local pronunciation of *mawlid*. Children born during this month are considered especially fortunate and are often named after it, and it is a good time to circumcise boys. Celebrations last a week, culminating with recitations of panegyrics of Muḥammad in decorated and illuminated com-

munity mosques. On the final night, recitations continue until daybreak. Some families offer a feast and distribute food to the poor; women decorate their hands and feet with henna and visit cemeteries. In Java, a feast is offered for the *mawlid*, which is one of the two most important calendrical ceremonies in a region given over to elaborate festival cycles. A popular Javanese belief is that the giving of feasts for the Prophet's birthday and the end of Ramaḍān distinguishes Muslims from non-Muslims and humans from animals; this view of the importance of the occasion is not necessarily shared by those Javanese who have a more elaborate understanding of Islamic doctrine and ritual.

The symbolism of the *mawlid* is especially highly developed among Swahili-speaking East African Muslims. In the town and island of Lamu, located off the northern coast of Kenya, most Muslims hold that the prophet Muḥammad, created of dust, like all other persons, carried "light" to the earth in this month. The discipline of fasting during the month of Ramadan emphasizes the separation of nature and culture and the distance between actual human society and the Islamic ideal. Likewise, the month of Muḥammad's birth is regarded as a joyous occasion that emphasizes life as lived here and now, combined with belief in the Prophet's willingness to intervene on behalf of his people and to accept them in full recognition of their individual shortcomings. It is said that during this month the Prophet lives on the earth like a human being and loves and hates just as they do. The first twelve days of the month are marked by processions, singing, and the music of tambourines and flutes. Intense competitions are held on successive evenings in the mosques and religious associations of the various quarters in Lamu. Each quarter vies in enthusiasm to praise Muḥammad's life and deeds in song and prose and to show its love for the Prophet. *Sharīfs*, descendants of Muḥammad, are especially honored in Lamu during this period.

Sharīfs are invited to recite poems in praise of Muḥammad in most of the nineteen mosques of Lamu town. In beautiful performances on successive evenings, assemblies of young boys from mosque schools and musicians perform songs and poems that have been rehearsed for months. Brightly colored tunics, donated by wealthy Muslims, are worn for the ceremonies. The freeborn and the ex-slaves, members of two important local social categories, compete with one another during these celebrations to express a willingness to use earthly wealth—the offer of food and refreshments to guests—and talent to show their love for the Prophet. If not enough effort is put into the preparations for quarter festivities, the *sharīfs* are said to participate with less enthusiasm and to attract fewer blessings for the quarter. Love of the Prophet is said to join together the world of nature and the world of culture. Ceremonies include the sacrifice of cows, highly valued on the island, visits to cemeteries, and the distribution of rose water by *sharīfs* to symbolize Muḥammad's ability to cleanse his followers of their sins. Until the 1970s distinctions between freeborn and ex-slave

and *sharif* and commoner remained significant for many East African Muslims, although in recent years such distinctions have been eroded under pressure from reformist Muslims.

In his *Muhammadan Festivals* (New York, 1951) G. E. Von Grunebaum discusses the early history of the *mawlid* and includes translations from original source materials. For the *mawlid* in more recent times, see Edward W. Lane's *An Account of the Manners and Customs of the Modern Egyptians*, 3d ed. (1846; reprint, New York, 1973), which includes a description of the celebrations as he saw them in Cairo in 1834. Michael Gilsenan's *Saint and Sufi in Modern Egypt* (Oxford, 1973) provides a brief commentary on contemporary Egyptian practices. For Morocco, Edward A. Westermarck's *Ritual and Belief in Morocco*, vol. 2 (1926; reprint, New Hyde Park, N. Y., 1968), remains the best-documented ethnographic account, while Pessah Shinar's "Traditional and Reformist Mawlid Celebrations in the Maghrib," in *Studies in Memory of Gaston Wiet*, edited by Myriam Rosen-Ayalon (Jerusalem, 1977), pp. 371–413, provides a richly analytic account of how *mawlid* practices have changed over time throughout North Africa. In *The Religion of Java* (Glencoe, Ill., 1960) Clifford Geertz mentions the *mawlid* only briefly but fully situates it in a highly elaborate ritual context. By far the most extensive discussion of the symbolism of occasion as elaborated in one local context is Abdul Hamid M. el-Zein's *The Sacred Meadows: A Structural Analysis of Religious Symbolism in an East African Town* (Evanston, Ill., 1974).

DALE F. EICKELMAN (1987)

MAWU-LISA is a complex deity worshipped in coastal West Africa by the Fon and most of the Ewe. Occasionally Mawu and Lisa are considered as separate deities; sometimes they are seen together as a complementary sexual pair. The issue is complicated because the Ewe peoples use the term *mawu* both to refer to God in a general way or to a specific deity.

As a specific deity, Mawu is seen as a creator, but she rarely has shrines, priests, or rituals dedicated to her. Among peoples such as the Fon, Mawu is conceived of as a female deity associated with the moon, and it is in this manifestation that she is most often paired with Lisa. Among the Fon, the cult of Mawu-Lisa was centered in Abomey, the capital of the old kingdom of Dahomey. Mawu is depicted as an elder female figure in conjunction with Lisa, a younger male consort. Other complementary qualities are seen in them. For example, whereas Mawu is associated with the moon (night) and is cool (gentle and forgiving), Lisa is associated with the sun (day) and is hot (fierce and punitive). Sometimes even their actions are complementary. In one mythic tradition, Mawu created the earth and then retired to the heavens. When she saw that things were not going well with men, she sent Lisa to make tools and clear the forests so that men could farm and live a civilized life.

The name *Lisa* among the Fon appears to be derived from the nearby Yoruba people, who use the word *oriṣa* (or *oriṣha*) to refer to lesser deities. Lisa is an analogue for the Yoruba *oriṣa* Ọbatala and is variously described as the twin brother, husband, or son of Mawu. This paired complementarity is not all that unusual in West Africa. Other pairs of spiritual beings include Nana-Buku of central Benin and Togo, Dada-Sogbo of the Ewe, and Eṣu-Legba of the Yoruba. Their pairing need not refer to sexuality but merely to the unity of duality, however that may be defined.

Mawu also creates human souls and rules their destinies. The soul is called *mawuse* (the Mawu within a person). At first, Mawu made people out of clay, but after running short, she began to make them out of reused bodies (hence we can see resemblances in people). Mawu upholds moral law and also metes out rewards and punishments after death.

The priests of Mawu wear white, and at Abomey there is a rare statue of Mawu. The figure, painted red, has large breasts and holds a crescent moon. The cult of Mawu is not limited to West Africa. There are scattered instances of Mawu's cult in the New World. For example, in Yoruba houses in São Luiz, Brazil, there is said to be an *encantado* (spirit) of Mawu. There, as in West Africa, Mawu connotes a generalized notion of divinity.

JAMES S. THAYER (1987)

MAXIMÓN is a trickster deity from Santiago Atitlán, Guatemala. His origin as a Mesoamerican merchant and lineage deity originates in the pre-classic Maya world (c. 500 BCE). His cult has spread throughout the highlands of Guatemala alongside the proselytizing evangelical movement among the Maya of the highlands. His image, in various forms, can now be found throughout the republic, but this essay concentrates on the deity found in Santiago Atitlán while recognizing the many similarities between the various Maximón cults found in different highland towns. Maximón is particularly important to all those people who want more out of life than simple sustenance; he specializes in giving everything that is "extra" in this world. His cult has thus grown to satisfy the focus of material wealth that is now so important to the people who inhabit the towns and villages of the Guatemalan highlands.

Maximón is a name derived from two different origins: first, from the Catholic Simón Pedro (Ximón Pedro) the first apostle of Christ who was given the keys to heaven and the

power of “binding and loosing”; second, from the Tz’utujil term meaning “Mr. Knotted,” derived from *ma* (mister) and *ximon* (to have knotted). Maximón is the trickster who waits at the portal of fate, where he either captures and binds his prey or loosens the knotted one from the trap of a predator. Like Simon Peter, he is seen as the gatekeeper of all those souls who are out on the road, at the crossroads of life, or in the marketplace where happenstance can change one’s luck. Maximón is the one who opens or closes the road to opportunity, creates an accidental meeting at the crossroads, or finds the needed connection in the marketplace.

Maximón is Lord of Merchants, similar to God L and God M of the ancient Maya. He is a tireless walker of roads without end; his wanderings lead him to wherever he is called, as well as to all those places where he creates problems that he alone can solve. He is the shape-shifter who alters his shape to the changing shape of the world in which he exists as trickster, and because of this his disguises are infinite.

He is *versipellis*, a being who changes its skin to imitate another being or an environment, a completely flexible being whose way is “no way.” Maximón is ever-present in his many forms, but mostly he is known to take the form of one of the following: a young girl, the old man, the latina temptress, the poor beggar, the wealthy plantation owner, the hummingbird, the blue jay, the skunk, the donkey, the wild mountain dahlia, the “divining tree,” a whirlwind, a night breeze, a earth tremor, a fly, a mosquito, a wafting scent of a cigar, or even a ripple across still water.

Like all tricksters he makes himself known to his followers through signs given on the road, where a heightened sense of insecurity is always felt. All of his disguises or changes give messages to those who follow his guidance to safe passage and profitable markets. He is lord of all those portals of opportunity where tax collectors let one pass unmolested, where obstacles are lifted, where government officials look the other way, where traps are avoided, and where doors of opportunity are flung wide open. He is lord of the crossroads where destinies accidentally come together for better or worse. He is lord of the marketplace where abundance is turned into wealth and where finding a new product or person brings about a life reversal. Maximón is guide to souls in need, both in this lifetime and at death; it is he who is the *k’amal b’iey* (pathfinder) who ushers us towards the direction we must be taking. Sacred history tells that Maximón was made of the “Tz’ajtel tree” (*erythrina corallodendron*), a type of “divining wood” used by shamans, diviners, matchmakers, midwives, and oracles to see into the future or back into the past.

Maximón is also known as Mam or Rilaj Mam, Ancestor or Great Ancestor. *Mam* means both “grandfather” and “grandchild,” making him a deity that replaces the ancestors with future ancestors in such a way that the lineage never dies. Mam is also known as “Year Bearer” in a Mayan world where the sun is carried on the back of humanity through ritual sacrifice. The Year Bearer carries the year, and the ritu-

al practitioners carry the Year Bearer through rituals of sacrifice. The Year Bearer is a sacred being who occupies the four corners of the world in a quadripartite fashion. In Maya timekeeping, each year had one of four styles, each of which had a Mam from one of the four world corners. As one year ended, the Year Bearer of that year was dismembered, purified, and then put back together as another Mam, another Year Bearer. In this way years are seen as human ancestors that continuously replace one another throughout time.

Mam also signifies the five dangerous days of the Uayeb’, a short, five-day month between two 360-day years, each of which is made up of eighteen months of twenty days. During this short five-day month of the Uayeb’, the Mam was celebrated as one year ended and another began. Mam is thus the Lord of Middle, where years end and begin, as well as lord of endless generations of ancestors, or Mam, and their replacements, also known as Mam.

Mam has many similarities with God N, or Pawahtuun, of the classic Maya. Pawahtuun was depicted as an aged sky-bearing deity who went about dressed in a conch shell or turtle carapace, linking him to waterways, lakes, and seas of merchant people. He was an old man who loved a party, where he would indulge himself in drunkenness as well as the affections of wild young women. As a quadripartite deity he was closely associated with the Chaks, or rain deities, and may have been the rain deities’ earthly counterpart. Mam, like Chak, is a deity of the four corners; as a mountain god, he personifies the stones or mountains that support the sky at each of the four corners. Mam in his most beloved form is an elderly lord of the earth, thunder, and the ancestors.

Tz’utujil tradition of Santiago Atitlán states that Mam was created by immortals known as Nawales, who were merchants and in much need of a guardian who would watch over their women while they were on the road and in the marketplaces of distant towns. As soon as Mam was brought to life by the Nawales as a replication of their perfection, he began doing what he had been ordered to. Pretty soon he was making love to all the wives of those who had created him. Eventually, Mam was dismembered and put back together in such away that he could never misuse his human body again: his head was twisted around backwards, and his arms and legs were left short. This is the image that is found today in the Cofradía of Santa Cruz in Santiago Atitlán. Like all tricksters, Mam’s appetites cause his fall from prescriptive culture, and so teaches people how not to act in the world.

The present-day image of Maximón stands about four-feet tall in a brand new pair of boots. He is adorned in many silk scarves, which once may have been feathers. On his gourd skull is a wooden mask of an old man. On the backside of his head is another mask, giving Mam a 360-degree view. Upon this head of twin masks are two modern Stetson cowboy hats, signifying the duplicity inherent in this capricious being. (The Stetson hats are given as gifts to Maximón by wealthy Indian merchants, who wear them themselves to manifest their high status in the Indian world.) His body is

made of pieces of divining wood that are tied together with sashes of traditional cloth and string. This ritually bundled core is adorned in traditional clothing from Santiago Atitlán and other towns from the lake region, creating a deity that looks much like it must have when the Nawales first formed it.

Mam, or Maximón, is a boundary crosser and a liminal character that lives at the threshold of this world of humans and the other world of the gods. He is the go-between and messenger that relays communication between humanity and their deities. In this middle ground between humans and gods he takes his payment in the form of offerings, including only flowers, incense, candles, liquor, tobacco, sweet-smelling waters, song, and prayers. He takes part of all that once was given only to the gods, and in this way he makes a good living by existing between and betwixt two worlds.

VINCENT STANZIONE (2005)

MAXIMOS THE CONFESSOR (c. 580–662), Byzantine theologian, Eastern Orthodox saint, ascetic writer, and opponent of monothelitism. What is known about Maximos's life largely derives from an anonymous biography.

Born in Constantinople, Maximos received a good education, which was rare for his time. Indicative of his abilities was his appointment as first secretary to the emperor Heraclius (r. 610–641), but Maximos soon recognized his ecclesiastical calling. He entered the Monastery of Philipikos, in Chrysopolis (present-day Üsküdar, Turkey), probably in 614, where he eventually became abbot. Because of attacks by the Persians, Maximos and the other monks were forced to flee to the Monastery of Saint George, at Cyzicus (present-day Kıpırdagi, Turkey). Two years later Maximos was again

obliged to flee because of Persian expansionism. His path likely took him through Crete, and probably Cyprus, to North Africa (626). It is well known that he was in Carthage on Pentecost of 632. At the Eucratas Monastery he became acquainted with Sophronios, another refugee, who later became patriarch of Jerusalem (634–638). Maximos was greatly influenced by Sophronios and later called him his forerunner, father, and teacher.

The two monks journeyed to Alexandria in an effort to overturn an agreement of union with the monophysites but were unable to persuade the former patriarch, Cyrus of Alexandria (d. 641), to their cause. Because such concessions to monophysitism were likely to terminate in the heresy of monoenergism, Sophronios had turned against the agreement; Maximos continued in the struggle against the union but acted in a reserved way. After Heraclius published his *Ecthesis* (638), and a monothelite direction was given to the heresy, Maximos cut off relations with the patriarch Pyrrhus and began his own antimonothelite activities.

Important stages of Maximos's struggle against monothelitism are his dialogue with the deposed Pyrrhus in Carthage; the convocation in North Africa of three antimonothelite synods, where he explained his position; and the continuation of his endeavors in Rome (646), which had become the new center of antimonothelitism. Maximos's efforts were now carried out with unmitigated zeal. He composed treatises and letters to the emperor, the pope, and the patriarch of Constantinople. His antihetical struggle prompted the convocation of a synod in Rome (649) where he condemned monothelitism.

Maximos's initiatives were regarded by the imperial authorities as hostile to its policy of union and reconciliation. Therefore, Maximos and his companions, one of whom was the papal legate, were taken to Constantinople for questioning. (This was in 655, not, as is commonly reported, during the reign of Pope Martin I.) Although the charge that he had betrayed the interests of the empire was not proved, Maximos was exiled (along with his two disciples) to Byzia in Thrace for refusing to sign the new conciliatory declaration, the *Typus* of Constans II, under Patriarch Peter (655–666). Maximos was called back to Constantinople in 656 for another investigation, but after refusing once again to sign, he was exiled and imprisoned at Perbera. Although his opponents were determined, Maximos's intransigence in matters of faith prevented him from giving in to them. Six years later, Maximos, Pope Martin, and Sophronios were anathemized. There followed exchanges of messages, rumors of torture (some say Maximos was beaten, his tongue cut out, and his right hand lopped off), and further exiling. Maximos was finally imprisoned in the fortress of Schimaris, where after two months he died, on August 13, 662.

Maximos composed numerous works on the interpretation of scripture and on the teachings of the fathers. His doctrinal writings consist largely of short treatises against monophysitism, a more important series against monothelitism,

and numerous other ascetical writings. He wrote commentaries on mystical theology and on the work of Dionysius the Areopagite (Pseudo-Dionysius). Also extant are many letters by Maximos, including the letters and disputation that he wrote to Pyrrhus. Some other writings exist only in manuscript.

The teachings of Maximos developed in two directions: on the one hand, in a theoretical direction, with strong metaphysical emphasis; and on the other, in an existential direction, which elaborated a spiritual way of life. In his theology of the unity and trinity of God, Maximos follows the ontological method and the teachings of the Greek fathers. The interpretation by some Western theologians that Maximos agrees with the view that the Holy Spirit proceeds from the Father and the Son cannot be demonstrated definitively. For example, Maximos sees in the Trinity the relation of three persons who participate jointly in one essence and jointly express a common divine energy: the Father, "by grace"; the Son, "by self-operation"; the Holy Spirit, "by synergy."

Maximos believed that the world was created by God so that beings could participate in his goodness. Accordingly, man holds the dominant place in creation and is the natural link between God and creation; further, all will is united to God through man. The first man, Maximos thought, was created with an orientation toward God and was meant to bridge the distance between "image" and "likeness." For Maximos, disobedience to the divine will constitutes deliberate sin, in which man's will is distorted and his nature corrupted; thus, man loses the grace of *apatheia*. Also, corruptibility in human nature is inherited; therefore, there is no human possibility of self-regeneration or of exemption from death. However, what man has done out of negligence, the man Christ has corrected.

Maximos's Christology is devoted to his struggle against monophysitism and monothelitism. For Maximos, in Christ, human nature, which had no previous existence as such, became substantial and received existence in the preexisting substance of God the Word (the Logos). As one being, Christ has the same humanity as man but he also has divinity. However, as in the Trinity, in Christ's being one essence is confessed without confusing the two natures.

The resolution of the question of whether there are one or two energies (or one or two wills) in Christ lies in the determination of their origin, that is, whether in the nature or in the person of Christ. For the monoenergists, Christ has only one energy because he has only one active element. For the monothelites, he has only one will because nature, according to doctrines of natural philosophy, is governed by the rule of necessity.

In order to oppose monophysitism, Maximos attempts to define the operational autonomy of the person on the basis of the dynamism of nature. He argues that nature, which is both noetic and created, "has no necessity" (*Patrologia Graeca* 91.293). Will, as a reasonable desire, pre-

supposes the habit of nature, which is movement and energy, not stasis. The will governs this nature within the functions of the person. For example, sight and speech are capacities inherent in nature, but "how" one sees is dependent upon the person. In this way, Maximos distinguishes between the natural origin of the will and its personal (that is, "gnomic") orientation. As such, will does not violate the order of nature but diverts its movement and, in this case, expresses the ethical responsibility of the person.

According to Maximos, Christ is recognized as God and man from his divine and human qualities. Christ willed, or acted, as God and man. Maximos sees a "divine-human will" and a "divine-human energy" in Christ's very nature. In distinction from his opponents, Maximos argues that if will is identical with persons (and not nature), then the Trinity, which is a trinity of persons, and not of natures, would have to comprise three wills. Further, if the energy were to flow from persons, there would be three energies in the Trinity, and Christ would be cut off from the energy of the Father and that of the Holy Spirit.

The human will of Christ is, by the logic of nature, the same as ours, but its manifestation in Christ is directed by the person of God the Word. Hence, Christ's will experienced everything human except sin. The famous phrase "My Father, if it is possible, let this cup pass from me; nevertheless, not as I will, but as thou wilt" (*Mt.* 26:39) expresses the will of the human nature in Christ, that is, his resistance to death as well as his acceptance of it. This is an indication that salvation is completed by the human will. Thus Maximos's intention is to defend the human will of Christ, which also constitutes a defense of the freedom of man in relation to God. Under such presuppositions, Christ healed and divinized corruptible human nature. Christ also formulated a new way of existence for man, free from sin and death. Furthermore, it is through the work of the church, Maximos believed, that familiarization with these gifts of Christ can occur. Likewise, in his dogmatic teaching, Maximos describes the spiritual life as a pedagogical way to salvation and divinization.

The three factors, according to Maximos, that mold man are God, human nature, and the world. It is man's will that moves him in relation to these factors. *Being* refers to the essence of man, *well-being* to the call of God to pass from the "image" to the "likeness" of God; *eternal being* is granted to those worthy of the grace of God. The development of the inner life cultivates the gift of baptism, through which human nature is renewed by Christ's existence. The discovery of freedom and the acquisition of virtues, especially of love, promote the social life of the person and union with God. Spiritual formation, which is carried out through natural and theological vision, follows. In the principles of creation and in the principles of human nature, God is discovered. In the divine Word we possess the unity of the Creator and creation, as the revelation of his person and work to the world.

Spiritual formation is fulfilled in the work of the Holy Spirit, which enlightens man, enabling him to understand beings, the meaning of the scriptures, and the mysteries of worship. At the very center of their existence Christians participate in the divine energy and receive awareness of the spiritual presence of God. Such a process—internal, moral, and spiritual—makes the person capable of *theōsis* (deification), that is, exemption from the corruption of creation and acquisition of union with God. Finally, full communion and union in the second coming of Christ is awaited as a consummation of our own personal lives, just as resurrection was the consummation of Christ's life.

Maximos's contribution to the intellectual support of orthodox views, his ecclesiastical conduct, and his witness as a confessor were recognized by the Third Council of Constantinople (680–681). The basic themes of his teaching, such as the distinction between nature and divine energy, the principles of nature and human will, the communion and synergy of God and man as persons, the participation of man in God, and *theōsis*—all of these influenced the spirituality and later direction of orthodox theology. For example, Maximos's authority was invoked during the hesychast dispute of the fourteenth century. The successful application of Aristotelian dialectic in theology was inaugurated by Maximos, and his teaching has provoked interest in modern theological circles.

NICHOLAS KARAZAFIRIS (1987)

MĀYĀ. is one of the key terms in Indian religious tradition. Its original meaning may be "creation" or "construction" (from the Sanskrit *mā*, "measure" or "mete out"), but the term can be used in several connotations, implying a power, a process, and the result of that process.

Development of the concept. In the history of Indian thought the term *māyā* is used with remarkable consistency, to express, define, and explain the enigma of life and the material world. The viewpoint expressed by Śāṅkara, admittedly pivotal, is often stressed too much, at the cost of other opinions conceived by intelligent minds from the time of the Vedas to the modern period. For the Vedic authors, *māyā* denoted the faculty that transforms an original concept of creative mind into concrete form, a faculty of immense proficiency and shrewdness such as is suggested by the English word *craft*.

In the Vedas, performances of *māyā* are mainly ascribed to divine beings, *devas* ("gods") or *asuras* ("countergods"). Each god works *māyā* in his own way and for his own ends. Thus, through *māyā* Varuṇa metes out the earth and creates order in nature (*Rgveda* 5.85.5 et al.), and Indra employs it to defeat the demon Vṛtra or to transform himself into another shape (*Rgveda* 6.47.18: "By his powers of *māyā*, Indra goes around in many forms," an oft-quoted phrase). The reality of all these mayic creations, however incomprehensible to common man, is never questioned. The Upaniṣads develop a metaphysical notion of *māyā* as the emanation of the phenomenal world by *brahman*, the cosmic Self. In post-Vedic Hinduism, the term can be used to convey a metaphysical, epistemological, mythological, or magical sense, depending on the immediate context.

METAPHYSICAL ASPECT. In Indian thought, *māyā* is the metaphysical principle that must be assumed in order to account for the transformation of the eternal and indivisible into the temporal and differentiated. Beginning with the Upaniṣads (*Chāndogya Upaniṣad* 6.1.4–6), empirical reality is most often conceived as a polymorphous modification or transformation of the Absolute, and thus maintains a "derived reality." Mahāyāna Buddhism, however, developed a concept of the world as a "substitution" or "delusion" conjured up by *māyā* as by an act of illusionism. The world process and our experience of it are devices to hide the inexpressible total void (Nāgārjuna, second century CE?), or cosmic consciousness. Even the Buddha's teaching is said to belong to this sphere of secondary reality. An attitude of nihilism is avoided by the concept of two levels of reality developed by Nāgārjuna: *pāramārthika* ("ultimate") and *vyāvahārika* ("practical"). It is therefore not correct to state that for these thinkers the world of *māyā* is a mere illusion.

In Hindu philosophy (especially the Vedānta school), the concept of *māyā* follows the Vedic tradition of a mysterious power of self-transformation. The Buddhist doctrine of an ultimate void is emphatically denied: the nonexistent cannot be the source of creation, just as a barren woman can never have a son, says Gauḍapāda (sixth century CE?). After him, Śaṅkara (c. eighth century CE) and later scions of the Advaita (“Nondualist”) school also deny ultimate reality to the phenomenal world. But creation is not totally unreal either, since it cannot be separated from the truth that is *brahman* (what else could be its cause?), and also because it retains a pragmatic validity for the individual as long as the liberating experience of all-oneness has not been reached. “Illusion” thus implies the mysteriously different, not the *nihil*.

Other Vedānta theorists tend to emphasize the reality of the mayic transformation. According to Rāmānuja (eleventh century CE), the world is a mode of existence of *brahman*, related to it as the body is to the soul. The Śaiva and Śākta schools of thought also held a realistic view of *māyā*. In the recent period, Vivekananda, Aurobindo, and others have endeavored to restate the doctrine of *māyā* in reaction to objections by other philosophical systems without deviating in essentials from the tradition.

EPISTEMOLOGICAL ASPECT. *Māyā* deludes cosmic consciousness into associating itself with individuality, sense perception, and the sensory objects of phenomenal reality. Gauḍapāda interprets this process as a misconception (*vikalpa*) of the pure and undivided self-consciousness of the *ātman*, just as in darkness a rope is mistakenly perceived as a snake. To dispel false perception is to attain true insight into the undivided Absolute. Śaṅkara prefers the term *avidyā* (“nescience”) or *ajñāna* (“ignorance”). This is not just the absence of insight but a positive entity, the cause of superimposition of external experience on the undefiled self-consciousness. Besides, there is a metaphysical *avidyā* assumed by Śaṅkara as a necessary cause for cosmic evolution in order to vindicate the doctrine of the static unity of *brahman*. Śaṅkara rejects the equation of ordinary waking experience with dream experience held by the Mahāyāna theorists and Gauḍapāda. In modern Hindu philosophy, the epistemological aspect of *māyā* is emphasized: *māyā* does not imply the denial of the reality of the world, but refers only to the relative validity of our experience.

OTHER ASPECTS. The speculative concept described above has often been clothed in religious myth and popular legend. In the popular mind, the power of *māyā* often amounted to feats of magic or illusionism (*indrajāla*). In the epic *Mahābhārata* (and elsewhere), this power is said to be wielded by God to beguile and delude mankind. “The Lord plays with his subjects as a child with its toys” (*Mahābhārata* 3.31.19f.). In other contexts, the phenomenal world is likened to a bubble on the water, a drop trickling from a lotus leaf, evanescent autumnal clouds, a colorful patch, or a circle of fire created by a torch. Several legends express the same view in allegorical form. Such religious imagery remains very

important in later Hinduism. In religious poetry, *māyā* is sometimes embodied as a tempting or fear-inspiring woman; she can be the consort of the male supreme being (Śrī for Viṣṇu, Rādhā for Kṛṣṇa, Devī for Śiva) or, in Śāktism, a manifestation of the Cosmic Mother in her own right as Māyādevī or Bhuvaneśvarī (Goddess of the World).

BIBLIOGRAPHY

Discussions of *māyā* and its place in Indian religious and philosophical thought are dealt with in several books of more general scope. A very scholarly, thoughtful, and dependable survey by a classical Indologist can be found in Jan Gonda's *Change and Continuity in Indian Religion* (The Hague, 1965), pp. 164–197. Gonda's discussion of *māyā* in this work is a summary and restatement of two of his earlier studies. Also very readable as an introduction is Paul D. Devanandan's *The Concept of Māyā: An Essay in Historical Survey of the Hindu Theory of the World, with Special Reference to the Vedānta* (London, 1950; Calcutta, 1954). The author's Christian viewpoint is not stressed. Anil K. Ray Chaudhuri's *The Doctrine of Māyā*, 2d rev. & enl. ed. (Calcutta, 1950), is a philosophical study with special emphasis on the epistemological doctrine of nescience in the Vedānta. A concise book that focuses mainly on *māyā* in twentieth-century Hindu philosophy is Ruth Reyna's *The Concept of Māyā from the Vedas to the Twentieth Century* (London and Bombay, 1962). My own book, *Māyā Divine and Human* (Delhi, 1978), is a study of Indian and Balinese sources in Sanskrit concentrating on the magical side of the *māyā* concept. Predating all of these works is Heinrich Zimmer's *Maya, der indische Mythos* (Stuttgart, 1936), which contains a wealth of legends and personal interpretations.

TEUN GOUDRIAAN (1987)

MAYA RELIGION, like many aspects of Maya civilization, is part of a widespread and long-lasting tradition of belief and culture shared by numerous ethnic groups in Mesoamerica. Neighboring cultures with whom the Maya interacted throughout their history, including the Mixe, Zapotec, and Mexica-Aztec, shared numerous aspects of this tradition, and indeed Maya religion, particularly in its present-day forms among traditional communities in southern Mexico and Guatemala, is difficult to distinguish as a separate tradition within the greater framework of Mesoamerican theology. These cultures shared a distinctive pantheistic model of belief and a specific calendar system defined by important numerological and ritual cycles. Maya religion is distinct, however, in that archaeological and textual data extend the direct evidence of its history and practice back some two thousand years, thus providing a time-depth unlike that available for any other Native American religious tradition. The vast majority of such ancient sources date from the so-called Classic period (250–850 CE), when particularly expressive religious monuments and inscriptions were widespread. In the post-Conquest world, Maya religion has

adapted and transformed, adopting elements of Christian ideology while at the same time adhering to many ancient concepts and ceremonies. Today, political empowerment and activism by Maya in Guatemala, in particular, has led to the revitalization of native cultural identity; religious expression, often based on appropriated ancient symbols and idea, occupies an important place in this modern movement.

COSMOLOGY AND DEEP TIME. Numerous spatial categories defined the basic elements of Maya cosmology: prominent among these are the earth's surface (*kab*), the sky (*chan*), the sun (*k'in*) and moon (*uh*) and their recurring paths, caves (*ch'een*), and mountains (*witz*). These and a few other terms were the vocabulary of space and the cyclical processes that inhabited them. In the Classic period, the word that most closely translates as "world" or "universe" was *chan ch'een*, "sky-and-cave," which comprised the two vertical extremes of existence, above and below the earthly realm of everyday human experience, where various gods dwelled.

Mountains, caves, and springs are of special importance in defining Maya sacred landscapes. Among many traditional communities, mountains are seen as animate beings, sometimes as manifestations of the earth lord. Other individual mountains are seen to be localized gods or "containers" for important ancestral figures. Communication with ancestors and earth lords took place through caves, which have from the earliest times been important settings for Maya ritual.

The earth and sky share a fundamental quadripartite organization corresponding more or less to the modern notion of the four cardinal directions. According to some conceptualizations, the four points of the sun's emergence and entrance on the horizon at summer and winter solstice marked the division of space into four quarters: east (*elk'in*), north (*xaman*), west (*ochk'in*), and south (*nohol*). Each direction was associated with its own color (red, white, black, and yellow, respectively), which corresponded to the basic color variations of maize grown in Mesoamerica. Several deities had directional aspects or manifestations and were colored accordingly, including the storm gods called *chaak*. Many temples and ceremonial plazas were built to evoke this four-part structure of the world, and such layouts of built spaces have persisted to this day. Sacred mountains were considered to be distributed in the natural landscape according to this four-part directional model.

Maya communities both ancient and modern are spatially arranged to evoke and reproduce certain aspects of cosmic organization. In pre-Columbian times the most prominent architectural form was the terraced pyramid, which clearly often served as an artificial ritual mountain. Buildings and architectural groups are often oriented toward important astronomical phenomena (such as the winter solstice sunrise, for example), and roadways entering towns were sometimes radiated out toward the four cardinal directions. Town centers were nodes of ritual activity due to their importance as cosmological centers.

Agriculture and the cyclical growth of human sustenance, based largely on maize, have left indelible marks on cosmological beliefs and Maya religion in general. The four colors associated with the cardinal directions in Maya cosmology (red, white, black, and yellow) find replication in the four principal varieties of maize. Maize, being the basic staple of the Maya diet throughout history, was also equated with the human body and its substance. Robert Carlsen and Martin Prechtel note in "Flowering of the Dead" (1991) that cycles of growth and harvest were and are seen as a general metaphor for human and universal patterns of change and regeneration, or what the modern Tzotzil Maya call *jaloj-k'exoj*, perhaps best translated as "change and renewal."

The ancient Maya made ample use of a complex calendar system that was shared to some degree among all Mesoamerican cultures. The solar year, computed as 365 whole days, was subdivided into a set of eighteen twenty-day "months," plus a remaining five-day liminal period (the *xmak'abak'inob* or "days without name" among the Yucatek Maya) associated with renewal. The months bore names suggesting that they were originally tied to important agricultural periods, but they also served as a basic framework for the scheduling of ritual festivals throughout the solar year. Running concurrently with this was a separate reckoning of days based on a 260-day cycle, wherein a given day was expressed as one of a set of twenty named days accompanied by a numerical coefficient of 1–13. Today this same calendar remains in use among conservative "day-keepers" in the highlands of Guatemala, where it is used in rites of divination.

A separate calendar system widely known as the *Long Count* operated concurrently with the 260-day and 365-day rounds described above. The Long Count was different in its structure, presenting a more linear reckoning of days by means of a place-notation arrangement that expressed an accumulation of elapsed days from a set starting point in the distant past. The temporal scope of the Long Count was therefore much greater than the 260-day and 365-day components of the Calendar Round. The three systems—the Long Count, the 260-day round, and the approximate solar-year cycle—together constituted a triumvirate of calendars used throughout Maya history.

The standard Long Count has five units, each standing for a set period of time. These are, in increasing order, the *K'in* (the single day), the *Winal* (each equaling twenty *K'ins*), the *Tun* (eighteen *Winals*, or 360 days), the *K'atun* (twenty *Tuns*, or 7,200 days), and the *Bak'tun* (twenty *K'atuns*, or 144,000 days). In writing Long Count dates in hieroglyphic form, the periods assume the opposite order, beginning with the *Bak'tun* and descending to the *K'in*. It can be seen that the system reflects the basic vigesimal (base-twenty) structure of Maya numeration, with larger periods composed of twenty units of the next lower period. The exception to this vigesimal pattern is the *Tun*, which is made up of eighteen *Winals* (360 days), seemingly so as to approximate the solar year of 365 days. In the notation system, a numerical coefficient was

assigned to each of these units to convey a certain amount of elapsed time from a specific starting date. A comparison to an automobile's odometer is perhaps apt, for the Long Count represented a perpetual accumulation of days.

In most circumstances, the standard Long Count of five periods provided an adequate mechanism for the tracking of time, yet it was structurally limited for recording and computing very large numbers of days. In certain ritual or mythical texts, however, scribes felt the need to compute greater time amounts—sometimes much greater—and in these records and calculations they employed time periods above the *Bak'tun*. The standard five-part Long Count is, in fact, a truncated version of a larger system composed of at least twenty-five periods that can be called the Grand Long Count. The standard Long Count represents the last five positions in this much larger cyclical arrangement. Textual evidence now points to the existence of twenty-one periods in the complete Grand Long Count, the highest period being equivalent to 20²² *Tuns* (that is, 20²² times 360 days). The conception of linear and cyclical time encompassed within this system is truly vast, and of course dwarfs the age of the universe as presently understood by Western science.

Ritual texts describe gods performing rituals millions of years in the past, but they also consistently refer to a “change” in the cosmic order on the day 13.0.0.0.0 4 *Ajaw* 8 *Kumk'u*, corresponding to August 13, 3114 BCE. This day, cited in numerous texts all over the Maya area, can rightly be called the traditional creation date in the ancient sources.

CREATIONS AND THE *POPOL VUH*. According to two related ancient sources, the creation of the present era on 13.0.0.0.0 saw the “placing in order” of various gods in the dark underworld. Another text on Stele C from Quirigua relates that a group of gods placed a set of three stones in the sky, reproducing the form of a domestic hearth. In many texts this particular location is described as being at “the sky's edge, the new hearth place.” The establishment of the new cosmic order thus replicated the placement and dedication of a house, an idea that is no doubt based on the widely shared belief among Mesoamerican peoples that the sky is the roof of a vast cosmic house, with support posts corresponding to the four cardinal points.

The most detailed ancient sources for creation mythology are the extensive inscriptions from Palenque, Mexico. Inscribed wall tablets in numerous temples record primordial myths from the time of the creation, the most important being the birth of three sibling gods known to Mayanists as the Palenque Triad, who later play important roles as supernatural patrons of the royal dynasty of Palenque. Chief among these gods was the first brother, known today as GI, who seems to have associations with the rising sun and perhaps also to Venus as the morning star. According to one important inscription, GI was a king in the pre-13.0.0.0.0 era who oversaw the ritual sacrifice of a cosmological crocodile, perhaps a symbol of the earth. This act of sacrifice set the stage for the creation of a new era that saw the rebirth and

reestablishment of a new cosmic order, with the Triad occupying a central role, at least at Palenque. Significantly, no other Maya kingdoms cite the Palenque Triad as a significant assembly of gods, suggesting the many communities had differing narratives of creation and the supernatural beings that participated in it.

Of all the primary written sources now extant, the most important is the *Popol Vuh*, or “Community Book,” written by a Kiche' scribe probably during the mid-sixteenth century from an earlier pre-Columbian pictorial document. The manuscript was discovered in the early eighteenth century by Friar Francisco Ximénez at his parish in San Tomas Chichicastenango, Guatemala. His meticulous copy of the lost original is preserved today and is the source for several published versions and translations. Other accounts of world creation exist from other regions in the Maya area, but these are relatively short fragments for the most part; the *Popol Vuh* is truly epic in its scope and narrative.

Portions of the *Popol Vuh* clearly tell old and elemental stories of Maya mythology. It opens with an account of the “sowing and the dawning” of the world and its inhabitants, partly by two creator beings named Tz'aqol and B'itol, best translated as “Builder” and “Shaper,” respectively. They act in concert with one another and with another more prominent creator being named Uk'u'xkaj, “Heart of the Sky,” and together they create earth and the animals that roam it. The gods demand veneration from “the deer and the birds,” but the animals cannot speak their names and worship them properly. In a series of trials and failures, Builder, Shaper, and Heart of the Sky therefore attempt to create humans, first with mud, then with wood. Before “proper” worshipful people are made, however, the story of creation shifts focus to the so-called Hero Twins, Hunahpu and Xbalanque. These brothers defeat a series of malevolent figures, including the proud primordial sun, Seven Macaw, and ultimately through cunning, trickery, and athleticism they defeat the lords of Xibalba, the realm of death. The twins are then resurrected as the sun and moon. Once this celestial and moral order is established, Builder and Shaper once more attempt the creation of humanity.

The ancient sources repeat certain elements of this story involving the Hero Twins—they are depicted in many examples of Maya art from a very early date—but creation narratives from Classic times suggest that several different accounts coexisted among various kingdoms. Palenque's complex mythological narrative, for example, is not found elsewhere, and it may well be that different ancient communities had different stories of sacred origin and creation.

GODS, SOULS, AND CONCEPTS OF THE SACRED. There is good reason to believe that the Maya religion saw the “sacred” as a pervasive and unifying feature of their natural and domestic world; the universe possessed this concept of deity (*k'uh*), but it was manifested most clearly and powerfully in specific places, objects, and individuals. This notion reflects a wider pantheistic organization of religious ideas within Me-

soamerican philosophy. It is difficult to distinguish this widespread notion of “divinity” from the related notion that the natural and cultural worlds possess a pervasive vital essence that lends Maya religion a certain “animistic” quality.

The souls of humans are also expressions of this vital force. Recent ethnographic work has shown that complex concepts surrounding the human soul operate to orient human experiences and life events in a cosmological framework. Terms for the soul vary considerably from community to community, but there is a basic consistency to many of the ideas, which are also reflected to some degree in ancient religious texts and artworks. The well-studied soul concepts among the Tzotzil Maya of Zinacantan, Chiapas, Mexico, offer a good illustration of these ideas and how they help to explain a Maya conception of the sacred. In Zinacantan, humans possess two basic types of souls called *ch'ulel* and *chanul*. The *ch'ulel* is the animating life spirit of the individual that inhabits the heart and blood of the person, and it consists of thirteen parts. A *ch'ulel* soul can also inhabit nonhuman things and materials, such as musical instruments, crosses, and even salt, perhaps because these create important sensations (sound, emotion, and taste). The *chanul* is a person's animal alter ego, sometimes perceived through dreams. In Zinacantan, the animal souls of the community are closely guarded by ancestors called “mothers-fathers,” who corral them within one of the important sacred mountains near the town. Both *ch'ulel* and *chanul* souls are key to understanding complex social relationships within the community. Through the *chanul* the ancestors exert powerful social and moral controls. As Evon Vogt states, “the most important interaction in the universe is not between person, nor between persons and objects, as we would perceive them; it is, instead, between the *ch'ulel* souls possessed by these persons and objects” (1976, p. 141). In ancient times, Maya kings derived much of their authority through their possession of an especially powerful *ch'ulel* soul, through which they expressed their divine role in the community and the cosmos.

The word *ch'ulel* derives from the word for *god* (*k'uh*, or its variant form *ch'uh*), and the term was applied to many sacred entities or objects. Ancient sources contain images and references to a great variety of deities that ranged from animate natural forces to localized patron figures and deified ancestors. Indeed, in the Classic inscriptions the collective term for the multitude of supernatural figures was *hunpikk'uh*, literally, “the eight thousand gods.”

For the Classic Maya, demons and fantastic beasts called *way* were considered personifications of disease and illness, images of which often decorated ritual ceramic vessels. These curious entities remain poorly understood, but they seem to have been important in complex ideas of witchcraft and its association with royal power. Individual dynasties and kingdoms appear to have had their own “patron beasts” that were important to the expression of supernatural prowess within and among communities.

Among the major gods are several animated natural forces, most prominent among them being K'inich Ajaw, the sun god, who occupied a celestial throne and may have had the feminine moon as his wife. Another was the maize god, who embodied the principal staple of the human diet in Mesoamerica and thus served as the focus of numerous cosmological and agricultural rituals. Chaak, the rain or storm god, had four aspects, each associated with one of the cardinal points. A more complex figure was K'awil, who is described as a god of agricultural fertility and sustenance at the time of European contact, but who in the more ancient sources from the Classic period seems to have also served as the embodiment of dynastic power and royal ancestry.

The god Itzamnah was the most prominent of deities at the time of the Conquest, and is described as the patron of learning, esoteric knowledge, and the arts. Classic period sources suggest that he was also a ruler of the celestial sphere, and he may well have been an aspect of the sun god who existed in the primordial time before creation. One of his principal aspects or manifestations was the Principal Bird Deity, a large bejeweled avian creature that perched atop the cosmic tree and served as an important symbol of rulership in the pre-Classic and early Classic periods. This bird is probably a distant ancestor of the solar deity named Seven Macaw, who plays an important role in the *Popol Vuh*.

Human ancestors often are active and important members of Maya communities, and in ancient times certain illustrious figures became the focal points of important ancestral “cults” heavily invested with political and cosmological symbolism. Perhaps the best known royal ancestor from the Classic period is the venerated king K'inich Yax K'uk' Mo' (“Great Sun Green Quetzal Macaw”), who was the dynastic founder at Copan, a major Maya kingdom in present-day Honduras. He reigned at Copan in the early fifth century, when he celebrated the turn of the *Bak'tun* cycle (9.0.0.0) in 435 CE. Over the next four centuries, later Copan kings declared themselves successors of the illustrious founder, and temples to him were continually refurbished and rebuilt over his resting place in the main acropolis. Excavations of this sacred *axis mundi* at Copan have revealed a series of superimposed buildings, ornately modeled and painted with iconography evoking the deified ancestor and his origin in distant time. All kings became divine ancestors upon death, and those who were more historically significant, such as “founders,” came to be especially venerated.

In the ideology of Classic Maya kingship, the category of historical ancestors easily melded with gods and mythological characters of the very distant past. At Palenque, for example, late Classic rulers traced their political and religious authority not only to dynastic founders but also to semi-mythical beings that were said to live thousands if not millions of years in the past. For example, the king K'inich Janab Pakal (603–683 CE) linked his accession in 615 to a deity who had assumed the status of rulership more than twenty-five million years in the past. Such like-in-kind juxtaposi-

tions of primordial time and human history were consistently featured in Classic Maya political ideology.

RITUAL AND RELIGIOUS SPECIALISTS. The traditional keepers of religious and divinatory knowledge were named *ajk'in*, “he/she of the day(s)” or “day-keeper.” This was sometimes simply translated as “priest” in colonial era sources, but the term was probably more specifically reserved for ritual specialists who possessed esoteric knowledge of the days and their varied meanings and prognostications. Today among the Kiche’ Maya of highland Guatemala, for example, *ajq’ij* refers to priest-shamans who oversee rites of curing, marriage, death, and burial, as well as more mundane divination ceremonies. Given the complex social hierarchies of Maya communities throughout history, there were no doubt different categories of priests and religious officials at various times and places.

In the Classic period the ruler, or *k’uhul ajaw* (literally, “holy lord”), occupied the most prominent and public position in the religious hierarchy. Ancient Maya kings oversaw the passage of important stations in the long count calendar, and were even symbolically equated with the time periods themselves (all period endings in the Long Count calendar fall on the day named *Ajaw*, which also means “lord” or “king”). On these and other occasions rulers were said to “conjure” (*tzak*) the spirits of ancestors and fertility, known generically as *k’awil*. This process, evidently achieved through bloodletting, was among the principal royal duties, and was made possible through the kings’ special ability to wield a force known as “creation and darkness” (*ch’ab ak’ab*). This enigmatic term probably relates to the widespread notion that birth and creation derive from “darkness,” which then came to be embodied through the procreative powers of rulers in a cosmological setting.

Other rituals recorded in ancient inscriptions seem to have been anchored to political events like accession to power and anniversaries. Important rites included ceremonial bloodletting, incense burning, and dance, and in many ways these activities overlapped and occurred in combination with one another. Formulaic prayers and orations are today key aspects of ritual performance, as they were no doubt in ancient times as well. The ancient texts are also replete with records of dedication rites for temples and other important religious monuments or spaces. The ritual activation of a temple or house was called *och k’abk’*, or “fire-entering,” and presumably involved the placement of censers and other ritual fires within shrines and on interior temple floors. Such rites seem to be an obvious antecedent to house dedication ceremonies found among many Maya communities in modern times.

RELIGIOUS ART AND ARCHITECTURE. Arguably all public art produced by the ancient Maya can be considered religious or ritual art in some sense. The ubiquitous type of sculpture from Classic period was the stela, an upright stone slab or column that typically bore hieroglyphic inscriptions and a portrait of a ruler engaged in ritual activities. Stelae were usu-

ally erected in the open plazas before pyramids and platforms, and served to mark important stations in the Long Count calendar or significant events of political history.

Maya cities of the pre-Classic and Classic periods were dominated by large ritual structures, often in the form of imposing pyramids. The remains of the largest pyramids are also the earliest, found at ruins such as Nakbe and El Mirador in present-day northern Guatemala, and dating from about 200 BCE to 200 CE. These manmade mountains are in fact some of the largest structures ever built in pre-Columbian America. Their terraces were typically decorated with massive plaster sculptures of deities and cosmological symbolism, clearly marking them as microcosmic spaces. Later Maya pyramids at centers such as Uaxactun and Tikal were likewise conceived as replicas of cosmological structures, though at smaller but still impressive scales. Structures were often dedicated to particular deities or to venerated ancestors who were buried in their centers. The temples atop pyramids were often adorned with interior paintings, sculpted stone panels, or plaster decorations. Some contained inner shrines that held effigy figures of clay or stone, and the burning of copal incense was pervasive in such sacred spaces.

REVIVALISM AND MODERN CHANGE. The process of conquest and conversion by Europeans began in the early sixteenth century, and today, after several centuries, most Maya would consider themselves devout Christians. Yet elements of pre-Columbian belief and religion have persisted, often interwoven and tightly integrated with old traditions of “folk Catholicism.” Today a core of basic beliefs still exerts a strong presence in Maya spirituality, and these vary widely among the communities of Guatemala, Belize, and Mexico. In recent years, indigenous political movements, in Guatemala in particular, have led to more open expressions of non-Christian ideas long hidden from view, as well as the appropriation of ancient ideas and symbols. Maya religion is increasingly being portrayed as a unified and unifying cosmology and ideology, different in some ways from its Classic period expression, but with roots nonetheless in the deep pre-Columbian past.

DAVID STUART (2005)

MAZDAKISM is a socioreligious movement that flared up in the reign of the Sasanian king Kavād (488–531 CE) under the leadership of Mazdak, son of Bāmdād. Its genesis, however, seems to go back to an earlier period, possibly the fourth century, when Zarādusht, a Zoroastrian priest, attempted through new interpretations of the Zoroastrian scriptures, to purify the faith.

A populist and egalitarian movement, Mazdakism socially preached in its acute form what modern scholars have called a communistic agenda, advocating an equitable distribution of property and breaking of the barriers which placed the concentration of wealth and women into the hands of the privileged classes. In terms of religious doctrine it exhibited some Gnostic features and apparently entertained a qabalistic notion of the significance of numbers and the letters of the alphabet. The followers of the sect called themselves Derest-dēnān (of the right faith). Kavād favored the movement for a while, but it was brutally suppressed by his son and successor, Khusrau I (531–579 CE). It went underground as a result and reappeared in various sectarian forms after the advent of Islam and the fall of the Sasanian Empire in the mid-seventh century.

THE SOURCES. No work of the Mazdakites has survived. Nearly all the information on Mazdakism derives from hostile sources. These can be divided in two categories: contemporary and post-Sasanian. The first consists of Syriac and Greek (Byzantine) works. Chief among them are Procopius’ *Persian Wars* and Agathias’s *Histories*, both in Greek; Pseudo-Joshua the Stylite’s *Chronicle* and Malalas of Antioch’s, *Chronographia* in Syriac. The second comprises Middle Persian, Arabic, and New Persian sources. The latter two are believed to have generally derived their information from *Khwaday-nāmag*, a compendium of Iranian history, myths, and legends, reflecting the views of the Sasanian nobles and

clergy, transmitted orally until it was committed to writing in the sixth century. Its translation into Arabic by Ibn al-Muqaffa (died c. 757) now lost, served as the chief source for subsequent Islamic histories of Persia. These focus on the events of the reigns of Kavād and Khusrau I, including the Mazdakite revolt. They emphasize the communistic features of the doctrine, lingering in particular—as do the Middle Persian passages—on sharing of women as common property and its evil consequences.

Among the most important is the report by the heresiographer Shāhrastānī (died 1153) which provides us with a glimpse of Mazdakite religious beliefs and theology. His source, Abu Isā Hārūn al-Warrāq (died 861), a Manichaean or Zoroastrian convert to Islam, seems to have had access to some genuine Mazdakite source.

MAZDAKITE DOCTRINE. According to Shāhrastānī’s account, the Mazdakites believed in two primordial principles, Light and Darkness. Light is endowed with knowledge and feeling and acts by design and free will, whereas Darkness is ignorant and blind and acts randomly and without direction. The admixture of the two is the result of pure accident, as will be their separation. From their mingling, two beings arose, the Manager of Good and the Manager of Evil. The Supreme Being is seated on his throne in the world above, as the [Sasanian] king of kings is seated in the world below; four Powers stand before him: Discernment, Understanding, Preservation, and Joy. There are four high-ranking officials before the king of kings, including the Chief Priest and Judge (*Mōbadān Mōbad*), the Chief *Hērbad* (religious doctor), the Commander of the Army (*Spāhbad*), and the Entertainment Master (*Rāmishgar*). The four Powers direct the world with the help of seven viziers (cf. the seven planets) who act within a circle of twelve spiritual forces (cf. the zodiac). When the four Powers and the Seven and Twelve come together in a human being, he becomes godly (*rabbānī*) and no longer subject to religious observances (implying antinomianism). The Supreme Being reigns by the power of the letters, of which the total sum constitutes the Supreme Name (*al-Isma al-a’zam*). Men who come to understand something of these letters have found the key to the Great Secret (*al-sirr al-akbar*). Those who are deprived will remain in blindness, ignorance, neglect and dullness (opposites of the four Powers).

From this brief but precious account the character and basic tenet of Mazdakite theology may be adduced and summarized as belief in:

1. A fundamental dualism, not far from that of Zoroastrianism or Manichaeism;
2. Three elements, compared to Zoroastrian four and Manichaean five;
3. The remoteness of the supreme deity, as evinced by the postulation of the two demiurgical “managers”;
4. A spiritual macrocosm, reflected in the mesocosm of our world and mirrored in the microcosm of humans;
5. The symbolic power of letters, words, and numbers as keys to the redemptive knowledge; and

6. Irrelevance of religious obligations and, therefore, the outward meaning of religious prescriptions, once a revelatory knowledge of the essence of the “secret” of religion is gained.

Such beliefs, which are typical of Gnostic religions, bring Mazdakism unmistakably within the orbit of the syncretistic faiths which developed in the early Christian centuries with an admixture of Iranian, Syro-Babylonian, and Hellenic thought. However, Shāhrastānī’s report probably reflects a late phase of Mazdakism, particularly since the terms used for the twelve spiritual forces are mostly New Persian rather than Middle Persian of Sasanian period. (Shāhrastānī’s account, however, leaves us in the dark on many essential matters such as Mazdakite eschatology, or the nature of revelation and prophethood, and the origin of the Evil principle.)

One of the fullest accounts of the social aspects of Mazdakite doctrine in Islamic sources appears in *Ghurur akhbār mulūk al-Furs*:

Mazdak declared that God placed the means of subsistence (*arzāq*) on earth so that people divide them among themselves equally, in a manner that no one of them could have more than his share; but people wronged one another and sought domination over one another; the strong defeated the weak and took exclusive possession of livelihood and property. It is absolutely necessary that one take from the rich for giving to the poor, so that all become equal in wealth. Whoever possesses an excess of property, women or goods, he has no more right to it than another. (p. 600)

The noted Muslim historian al-Tabari (d. 923) adds in *The History of al-Tabari* that Mazdak believed that such deeds were “an act of piety that pleased God and was rewarded by Him with the best of rewards” (vol. 1, p. 893).

In his verse rendering of *Khwadāy-nāmag*, Firdawsī (d. c. 1026) provides some further detail on the moral philosophy of the sect (vol. VIII, p. 46): men are turned from righteousness by five demons (envy, wrath, vengeance, need [*ā niyāz*], and greed) to prevail against these and to tread the path of the good religion, wealth and women must be made common. The sources do not specify any rules or regulations that Mazdak may have prescribed for a just distribution of women and wealth; they mostly concentrate on the alleged community of women, the resulting promiscuity, and its confusing effect on the line of descent.

Many modern scholars, including Mansour Shaki (1978) and Patricia Crone (1991), have taken the sharing of women at its face value, ignoring the impracticability of such a provision in a large, tradition-based society as was Sasanian Iran, and where virtue depended as much on race and lineage (*gowhar*, *nasab*) as on personal accomplishments (*honar*, *hasab*). It would have gone against the grain of all the Zoroastrian faithful and would have destroyed the social fabric of the country. What appears to be true is that Mazdak advocated a number of measures, such as prohibiting accumulation of women or having more than one wife; reducing the finan-

cial requirement of marriage, such as the dowry (and marriage portion for the wife [*kābin*]); and breaking of the herms and allowing intermarriage among social estates. Hostile sources have cast such prescriptions in the mold of a standard accusation against all heretics as a juicy and scandalizing weapon against the Mazdakites. There is no evidence of promiscuity among the offshoots of the Mazdakism that sprang up in Islamic times and from which one learns more about the Mazdakites.

Studies

The first scholar to bring Greek, Syriac, and Islamic sources systematically together was Th. Nöldeke, *Geschichte der Perser und Araber* (Leipzig, 1879), pp. 284–291. A. Christensen devoted a monograph, *Le règne du roi Kawād I et le communisme mazdakite* (Copenhagen, 1925) to a full discussion of the Mazdakite revolt, believing mistakenly, however, that Mazdakism was an offshoot of Manichaeism. Gholam Hossein Sadighi’s *Les mouvements religieux iraniens au IIe et au IIIe siècle de l’hégire* (Paris, 1938) is particularly useful for its close examination of the Khorramis and some other Islamic sectarians with Mazdakite roots. Nina Viktorovna Pigulevskaya, in her *Les villes de l’état iranien aux époques parthe et sassanide* (Paris, 1963), pp. 195–230, reflects the Marxist point of view and considers the movement born of the peasant protests against Kavād’s and Khusrau I’s land survey and tax reforms. In 1957, Otakar Klima, the Czech scholar, published in Prague his monograph *Mazdak*, a comprehensive study of the movement (in the context of Sasanian history and Middle Eastern religions), conceiving Mazdakism as a social movement in religious garb brought about by social and economic conditions in Sasanian Iran. He followed later with another monograph on Mazdakism, *Beiträge zur Gesch-*

ichte des Mazdakismus (Prague, 1977), where he considered the absence of the Mazdak's name in contemporary sources as the result of a deliberate attempt on the part of Khusrau I to delete his name from all records and force oblivion of his memory. In 1978 Mansour Shaki published "The Social Doctrine of Mazdak," based on Middle Persian passages in the Zoroastrian encyclopedic work *Dēnkard*, written in the ninth or tenth century but based on Sasanian materials; he provided a new translation of these difficult and corrupted passages, attempted earlier by Marijan Molé in 1961, emphasizing the communistic aspects of Mazdakism and the sharing of women and property by all.

In 1982 Heinz Gaube, pointing to the absence of Mazdak's name in the contemporary sources and also a number of contradictions in the Islamic reports, doubted even the very existence of Mazdak and thought it likely that the revolt had to do with the tax reforms initiated by Kavād and followed up by Khusrau I, who later manipulated the reports and placed the blame for the upheavals on Mazdak, possibly an invention of him, in order to save the reputation of his father—a view which has not found favorable reception (see Crone, pp. 22–23).

Ehsan Yarshater's chapter on Mazdakism in the *Cambridge History of Iran III/2* (Cambridge, 1983), pp. 991–1024, provides a comprehensive presentation of Mazdakite doctrine and analysis of the sources and discusses the Islamic sects, mostly of an esoteric nature, that derived from Mazdakism in the first centuries of Islam.

In a second article, "The Cosmogonical and Cosmological Teachings of Mazdak" (*Acta Iranica XI*, 1985, pp. 527–543), Shaki tried to make sense of a number of terms reported in the work of Shahrastānī.

In 1988, Werner Sundermann, who had written an article in 1977 about Mazdakite uprising, "Mazdak und die mazdakitischen Volksaufstände," *Das Altertum* 23, pp. 245–249, offered a German translation of the very obscure and laconic passage of Book VII of the *Dēnkard*, which differs somewhat from that of Shaki but still remains far from clear in all its details.

In 1991, Patricia Crone, in "Kavād's Heresy and Mazdak's Revolt" (*Iran* 29: pp. 21–42), presented a thorough analysis of the sources with a view of finding a solution to the existing contradictions in the reports about Mazdak and the historical events related to him. She, too, considered the revolt as a result of Khusrau I's cadastral reform and the hardship it caused the peasantry.

EHSAN YARSHATER (2005)

MAZE SEE LABYRINTH

MBONA (sometimes also spelled M'Bona or M'bona) is the name of the patronal deity of a famous shrine near the township of Nsanje in the Republic of Malawi (southeastern Africa). Although he is usually referred to as a rain god, Mbona is also invoked on the occasion of locust plagues, floods, epidemic diseases, and other acute threats to the productive and reproductive capacities of the land and its population.

Mbona's is a territorial cult, which may be defined as a cult whose constituency is a territorial group identified by common occupation of a land area, so that membership, in the final instance, is a consequence of residence and not kinship or ethnic designation. The cult is supervised by local chiefs and headmen under the chairmanship of a high priest and a chief administrator. In addition to these officials, there is also a spirit medium, a man or woman who on occasion claims to be possessed by Mbona and who comments on a variety of urgent political issues while possessed. Formerly, the cult also maintained a spirit wife, a woman consecrated for life to Mbona's service, who was supposed to receive revelations from the deity in her dreams and was regularly consulted by chiefs and other important people. There no longer is a permanent spirit wife, but on ceremonial occasions her place is taken temporarily by a local woman. Although the oldest known written documents on the cult date only from the middle of the nineteenth century, it is much older, predating even the Portuguese penetration of the southeast African interior in the first half of the sixteenth century.

According to oral tradition, Mbona was a celebrated rainmaker who, on account of his great popularity, came into conflict with the secular and religious authorities of the day, who in the end had him killed. Following his death, the local populace is said to have erected a shrine to his name and thus to have initiated the cult. The story of Mbona's life and death is known in many versions, but all follow a common structure and can be reduced to three streams or clusters depending on whether the events of the narrative take place in a stateless setting, an emergent state, or a highly centralized kingdom. The mightier the state, the more Mbona is portrayed as a marginal person. Mbona's diminishing status therefore seems to symbolize the increasing subjection of the commonalty to the aristocracy at successive stages of state formation.

As stated before, there are no known written documents on the cult prior to the middle of the nineteenth century; nevertheless, certain names and events referred to in the Mbona legends are also found in Portuguese documents pertaining to the sixteenth and seventeenth centuries. From a comparison between the legends and the historical texts it can be inferred, among other things, that the cult underwent major organizational and theological changes about 1600 and that, probably under Portuguese missionary influence, Mbona was attributed certain Christ-like traits. After this radical transformation, the cult gained its widest geographical acceptance and became one of the most influential religious organizations on the north bank of the Zambezi. In the twentieth century, however, its importance diminished to the extent that as of 1985 the cult had little more than local significance.

BIBLIOGRAPHY

Discussions of various aspects of the Mbona cult can be found in essays I have contributed to several special collections. Among them are "The History and Political Role of the

M'Bona Cult among the Mang'anja," in *The Historical Study of African Religion*, edited by T. O. Ranger and Isaria N. Kimambo (Berkeley, Calif., 1972); "The Interaction of the M'Bona Cult and Christianity, 1859–1963," in *Themes in the Christian History of Central Africa*, edited by T. O. Ranger and John Weller (Berkeley, Calif., 1975); "Cult Idioms and the Dialectics of a Region," in *Regional Cults*, edited by R. P. Werbner (New York, 1977); "The Chisumphi and Mbona Cults in Malawi: A Comparative History," in *Guardians of the Land*, edited by J. Matthew Schoffeleers (Gwelo, 1978); and "Oral History and the Retrieval of the Distant Past: On the Use of Legendary Chronicles as Sources of Historical Information," in *Theoretical Explorations in African Religion*, edited by Wim van Binsbergen and J. Matthew Schoffeleers (London, 1984).

Revised Bibliography

MCPHERSON, AIMEE SEMPLE (1890–1944), American Pentecostal evangelist and divine healer. McPherson was born Aimee Elizabeth Kennedy on a farm near Ingersoll, Ontario, Canada. Raised in the Salvation Army, she was converted to Pentecostalism through the preaching of Robert James Semple, whom she married in 1908 and accompanied to China, where they served as missionaries until Semple's death in 1910. Two subsequent marriages ended in divorce.

In 1917, McPherson embarked upon an evangelistic and divine healing career in the United States that quickly brought her national and international fame. In 1923, she settled in Los Angeles and built the five-thousand-seat Angelus Temple, a center of welfare services, and in 1927, she incorporated her large network of churches as the International Church of the Foursquare Gospel. She also founded a ministerial institute, later named the Lighthouse of International Foursquare Evangelism (LIFE) Bible College.

McPherson's turbulent personal life, involving her alleged kidnapping, rumors of romantic liaisons, dozens of lawsuits, conflicts with her mother and daughter, and divorce from her third husband, brought her much notoriety. Nevertheless, she retained the unwavering loyalty of her followers. Her denomination grew to four hundred congregations in the United States, two hundred mission stations abroad, and a worldwide total of twenty-two thousand members at the time of her death.

McPherson's Foursquare Gospel was a restatement of standard Pentecostal doctrine focusing on Jesus Christ as savior, baptizer in the Holy Spirit, healer, and coming king. She

wrote several autobiographical books, published numerous pamphlets and articles, edited two periodicals, and composed some eighty hymns and five sacred operas. In her preaching she avoided condemnation and appeals to fear, emphasizing instead the love and joy that religion provides.

McPherson was unique in her evangelistic style. Her mastery at promoting herself and her work through the media made "Sister Aimee," or simply "Aimee," a household name. She was a pioneer in religious broadcasting, establishing the first church-owned radio station (KFSG) in the United States in 1924. She adapted the techniques of vaudeville and the theater to evangelism, using costumes, lighting, scenery and props, orchestras and brass bands, huge choirs, and dramatizations to achieve an unforgettable emotional impact on her audiences. Endowed with enormous energy and optimism, a powerful, melodious voice, rare acting ability, and a physical attractiveness heightened by an aura of sexuality, she was acclaimed a spellbinding platform personality by the millions to whom she preached.

ROBERT MAPES ANDERSON (1987)

MEAD, MARGARET (1901–1978) was America's best-known anthropologist of the twentieth century. She grew up in Pennsylvania, briefly attended DePauw University in Greencastle, Indiana, and moved to New York City where she received her B.A. in psychology from Barnard College. Mead completed her education with an M.A. in psychology and a Ph.D. in anthropology from Columbia University. In the mid-1920s she became a curator of anthropology at the American Museum of Natural History in New York, where she spent her entire professional life. In a career that lasted over fifty years, Mead was an energetic researcher, prolific author, sought-after public speaker, influential public thinker, and tireless champion for the young discipline of anthropology.

Mead's research on several cultures in the South Pacific during the 1920s and 1930s, including Samoans, Manus, Balinese, and the Arapesh, Mundugumor, Tchambuli, and Iatmul of New Guinea, led to a number of popular books and professional monographs. Her research focused primarily on childhood, youth, and adolescence, as well as kinship and social organization. She is also known as the founder of the culture-and-personality school of cultural anthropology. Although Mead is not well known for her contributions to the study of religion, she nevertheless wrote about religion for both professional and popular audiences.

Mead's research on religion in her professional work is reflected in her detailed monograph on Arapesh supernaturalism (1940). It is her most comprehensive description of an indigenous religious system, containing extensive data on this New Guinea tribal culture's cosmology, myths, ritual beliefs, and practices. In this work, she gave special attention to rites of passage. Mead also published articles on taboo, magic, and men's houses in New Guinea. Based on her extensive fieldwork on the island of Manus, off the coast of New Guinea, she wrote about the belief in animism among adults and children, as well as long-term religious change in *New Lives for Old* (1956). She also described a revitalization movement on Manus (1964).

In *Balinese Character* (1942), Mead and Gregory Bateson used photographic analysis to comprehend Balinese trance. Their documentary, *Trance and Dance in Bali* (1952), is considered a classic in ethnographic film. In most of Mead's work on indigenous cultures, though, religion was tangential to other topics. For example, in *Coming of Age in Samoa* (1928), she briefly discussed the role of Christianity in the lives of adolescent girls. Mead viewed Christianity as playing a relatively benign role in adolescent socialization and was subsequently criticized by anthropologist Derek Freeman for not fully addressing what he viewed as the harsh and puritanical Christian morality of the time (Freeman, 1983). Mead also wrote a chapter on the child and the supernatural in *Growing Up in New Guinea* (1930) and one on religious institutions in *The Changing Culture of an Indian Tribe* (1932).

Although she wrote about religion based on her fieldwork, Mead's detailed ethnographic work on religion did not provide major contributions to theories of religion. She favored a more scientific, psychological, and developmental approach to religion that was superseded by more humanistic, symbolic approaches in anthropology. Mead's pioneering descriptions published in the 1930s and 1940s yielded to the interpretive ideas of Clifford Geertz, Victor Turner, and Mary Douglas in the 1960s and thereafter. And, while Mead was a forerunner of feminist approaches to the study of culture in general, she did not offer a feminist approach to the study of religion.

Mead wrote a good deal about religion in her role as a public intellectual, especially in her later life. She was very interested in religion in her own life, in the United States,

and in the world at large. Although her parents were atheists, at age eleven Mead asked to be baptized. Her first husband, Luther Cressman, was an Episcopalian minister, and early in their courtship Mead planned to be a minister's wife. As she became a professional anthropologist, her goals changed. Yet Mead continued to be a religious person, unlike most of her colleagues in anthropology. Unknown to many of her friends, she secretly maintained her Christian faith.

In the 1960s, she saw a new role for Christianity in the world community, involving issues like civil rights and ecumenism. She was asked to be a representative for the Episcopal Church to the World Council of Churches, which she attended for several years. Mead was deeply involved in this project and authored *Twentieth Century Faith: Hope and Survival* (1972) about religion in the age of technology. Mead also wrote a number of opinion pieces on religion for the lay public in religious magazines and for her long-running column in *Redbook* magazine. She discussed the spiritual dimensions of birth control, the right to die, women as priests, the contemporary fascination with the occult, and other issues of the day. Mead saw no conflict between religion and science, and she envisioned a world where the faiths of other cultures would not be considered inferior. In her role as a public intellectual, she wrote more extensively on religion for a popular audience than she had for her peers in anthropology.

PAUL SHANKMAN (2005)

MECCA SEE PILGRIMAGE, *ARTICLE ON MUSLIM PILGRIMAGE*

MEDIA AND RELIGION. The media have come to play an ever more prominent role in social and cultural life since the emergence of the so-called “mass media” in the late nineteenth century. Before that time, even though the media through which social and cultural knowledge were shared (oral transmission, ritual performance, writing, visual representation, and printing) were vital, they were more tacit and transparent to the processes they enabled. Today, in a range of social and cultural contexts, the media are foregrounded, even determinative.

The mass media emerged as the result of interacting technological and social developments. Mechanized printing, which developed with the industrial revolution and found its way into mass-market communication in Britain in the 1870s, brought about major changes in production, in reception, and in the political economy of media. Mass production allowed media to be financially supported by advertising instead of direct sales of newspapers or magazines. The resultant economic logic saw readers as audiences and sought to maximize their numbers. This coincided with the increasing concentration of populations in urban settings, removed from the social and cultural supports of the village and town. These audiences began to be thought of as “mass” audiences, and the content of media began to reflect more generalized class tastes.

A debate has raged ever since over how the resulting relationship between the mass audience and the mass media is to be seen. To some observers, the media ideologically dominate the audience. To others, the media act as a kind of cultural canvas on which is inscribed the more or less common themes, ideas, and discourses of the culture. To still others, the media are important as palliatives, replacing the lost connectedness of pre-industrial village life. For most, the class and taste orientation of mass media necessarily has meant that they are at least not the preferred communicational context for the authentic business of the culture.

These structural realities and social assumptions have come to condition the way the media function in relation to culture, and therefore, religion. The media are connected with generalized “mass” tastes. They are industrial and technical and thus are seen as artificial and their abilities to authentically articulate cultural and social artifacts, symbols, and values are suspect. They are commercial, and thus necessarily traffic in commodified culture and cultural experience. At the same time, though, they are intrinsically articulated into the fabric of modernity in ever-deepening ways. Thus, while social and cultural structures and institutions might wish to exist outside the boundaries of media culture, it is increasingly difficult for them to do so. These realities define the role that media play in the evolution of modern and late-modern religious institutions and practices.

The role of the media is not only social-structural, it is also geographic and semiotic/aesthetic. And, as the scholarly study of the interaction between religion and media has developed in recent years, it has become obvious that these

three aspects of mediatization interact in interesting ways in the formation of the religious-media landscape. A phenomenology of media and religion in the twenty-first century would see media and religion in a number of different relationships.

RELIGION USING MEDIA. There is of course a long and deep history of mediation of religion. Various religions have been typified by means of their relationship to various media. It is commonplace to think of the development of the religions of the modern West as having been affected in major ways by moveable-type printing. In the twentieth century, a number of religions developed specific and particular relationships to the mass media. In most cases, these relationships were defined by the assumption of a kind of dualism, separating the “sacred” sphere of authentic religious history, claims, faith, and practice, from a “profane” sphere represented by the media. Islam, for example, is widely thought to eschew mass mediation, and particularly mediated visual depiction. The asceticism of Buddhism is also thought to separate it from a media sphere dominated by materiality and material concerns. Jewish scholarship has stressed the importance of “the book,” but has tended to think that other modes of communication and representation were less worthy.

At the same time that Christian thought has assumed the sacred-profane dualism, Christianity in the modern and late-modern West has come to exhibit a range of responses and relationships to mass media, and the Christian relationship has come to be in some ways definitive, due to the fact that the media of the Christian West have come to dominate the media worldwide (a situation that has begun to change in small ways). Christian groups were among the earliest publishers in both Europe and North America. The evangelical impulse in Christianity seems, over time, to have given it a particular cultural interest in publication. All Christian groups (and most non-Christian groups and other religious movements in Europe and North America) have historically produced printed materials such as tracts, pamphlets, newsletters, magazines, Sunday school materials, and books. Missions programs, including Bible societies, have also been prolific publishers.

The nonprint media have been a less comfortable context for most religions, however. In the twentieth century, as the establishment religions of Europe and North America confronted the emergence of the mass media, these groups began a struggle for definition and cultural ascendancy that continues unabated. The dualist assumption brings with it a suspicion of the media of the “profane” sphere. While the medium of print has long been understood by religions to be an appropriate context for the conveyance of religious ideas and values, the succeeding waves of non-print “new” media have been seen differently. Probably as a result of their association with secular entertainment and thus secular values, film, broadcasting, television, and digital media has, in its turn, met with suspicion on the part of religion and religious authorities.

The most significant exception to this has been the case of Evangelical Protestantism. Beginning with the earliest days of radio, Fundamentalist and later Evangelical individuals and groups have seen great promise in these new technologies. It can even be argued that through the careful use of film, radio, and television, that what now is known as “neo-Evangelicalism” found its place in the religious landscape. Billy Graham, for example, who became one of the most significant Evangelical leaders of the twentieth century, was an active producer of media of all kinds, and is widely regarded as having risen to prominence in part as a “media figure.” This further suggests a central role for mass media in religious evolution, as the mediation of Graham and the Evangelical movement generally played a large part in establishing their legitimacy. The phenomenon of televangelism, which emerged in the 1970s in North America and then spread, as a form, to much of the world, further contributed to the definition of religious and political landscapes. Such use of media by religion is not without its dangers, however. As a number of scholars have noted, religion has had to make compromises in order to fit into the structural and other conditions and limitations of the media form.

MEDIA USING RELIGION. Traditionally, the media have been most involved in the presentation of religion through journalism. The mass media era began with the development of a mass press, and in addition to the development of new audiences and new economies, it also developed new content. Before the mass press, most press in Europe and North America were partisan in one way or another, beholden to political, clerical, even corporate authority. The new economy of mass publication meant that the press could be freed from patronage, and that new readers and audiences would be coming to the press for a wider range of material than in the past. The result was the notion of newspapers and magazines as public records, presumably speaking from positions outside the narrow perspectives of special interests. This kind of journalism needed to find its voice, and new models of journalism and new roles for journalism in public and political life emerged.

In the case of North America, religion has not necessarily been part of that mix. For most of the twentieth century, religion was seen by journalism to be a story of religious institutions and their practices and prerogatives. At the same time, these institutions were treated with deference, when treated at all. There was much evidence that religious institutions, at least, were of fading importance as the century progressed, and journalism generally assumed that secularization was moving ahead apace. It was not until late in the century that religion came to be seen as “hard” news, largely as the result of news events such as the Islamic Revolution in Iran in 1979, the rise of traditionalist religious movements worldwide, and the emergence of Evangelicalism as a political force in North America. The terrorist attacks of September 11, 2001, on New York, Washington, D.C., and Pennsylvania, put religion much more squarely on the “news agenda,” with

increasing coverage of religion per se among European and North American journalism.

RELIGION AND MEDIA CONVERGE. The entertainment media have had an independent relationship to religion and religious content. There has been a tendency for these media to see the relationship in dualistic terms, evidenced by such things as the separate best-seller lists maintained for religious and non-religious book titles. The religious “market” for commercialized religious films, magazines, and books is now a multi-million-dollar industry worldwide, but is still thought of as a separate field from the dominant, and larger, “secular” market.

In that secular market, there are important examples in most major media and across most of the century. Early in the century, the so-called “Biblical Epics” such as *The Ten Commandments* and *The Robe* became major breakthrough films, attracting large numbers of conservative Christians and Jews to theaters for the first time. Later in the century, an explosion of book and magazine publishing devoted to spirituality, therapy, and self-help became one of the major trends in that industry.

In entertainment television, a range of new programs and series began to appear in the 1990s, featuring both explicitly and implicitly religious themes. Globally syndicated U.S. programs such as *Touched by an Angel*, *The X-Files*, *Buffy: Vampire Slayer*, *The Simpsons*, and *Northern Exposure* integrated a wide range of religious sensibilities, from traditional, to spiritual, to New Age, to Pagan and Wiccan. The situation became even more diverse in the digital media of the internet.

These trends resulted from changes in both religion and the media. For the media, rapid change in the structure and regulation of the electronic and digital media led to an exponential increase in the ubiquity and number of such channels fed into homes worldwide. A simultaneous increase in the differentiation of printed media into smaller and smaller “niche” markets meant that the media were both motivated to seek out new content and audiences, and to become increasingly able to provide material suiting specialized tastes. At the same time, religion was also undergoing great change, described in the case of North America as a “restructuring” that de-emphasized the traditional religious institutions. At the same time, religion increasingly became focused in the religious practices and meaning quests of individuals.

This new, more autonomous religious individualism, called “seeking” or “questing” by sociologists, naturally articulates with a mediated culture that can and does increasingly provide resources related to that project. Thus, a market for commodified religious symbols, rituals, and other resources arises, made possible by emerging attitudes oriented to religious and spiritual issues, and by a media system that can provide for increasingly specialized and focused tastes. The result is the gradual erosion of whatever bright line might have once existed between the “sacred” world of legitimate

religious media and a “profane” world of secular media. At the beginning of the twenty-first century, that division is less and less obvious. It has become, for all practical purposes, one media culture.

There are important antecedents to this convergence of religion and media. In the case of North America, which largely led these developments, Protestantism has long tolerated, even encouraged, the development of religious commodities, religious markets, and religious spectacles. American Christianity has thus long had a nascent culture of mediated religious commodities and has cultivated in succeeding generations tastes and interests in such approaches to faith and spirituality.

RELIGION AND MEDIA INTERACT. The evolving relationship between media and religion, then, is best seen as an interaction between them rather than an effect or influence one may have on the other. Increasingly, scholars of religion and media are describing this interaction in its reception and the experiences of individuals and groups as they encounter media culture and work to inhabit religious lives in relation to it. This can be seen on both radically local and radically global levels. On the local level, in a wide range of contexts, the interaction between media culture and religious culture comes alive in the ways individuals and groups use the various cultural resources available to them to make meaning in their lives. This is seen most readily in the field context, where observers encounter evidence of negotiated relations between the lived local and the mediated non-local. As anthropologist Lila Abu-Lughod reflects in her essay, “The Interpretation of Cultures after Television”:

In *Writing Women’s Worlds*, I suggested that we could write critical ethnographies that went “against the grain” of global inequalities, even as we had to remain modest in our claims to radicalism and realistic about the impacts of these ethnographies. Television, I believe, is particularly useful for writing against the grain because it forces us to represent people in distant villages as part of the same cultural worlds we inhabit—worlds of mass media, consumption, and dispersed communities of the imagination. To write about television in Egypt, or Indonesia, or Brazil is to write about the articulation of the transnational, the national, the local, and the personal. Television is not the only way to do this, of course . . . [b]ut television makes it especially difficult to write as if culture and cultures . . . were the most powerful ways to make sense of the world. (Lila Abu-Lughod, 1999, pp. 110–135)

On the global level, media and religion interact in events such as the national and international experience of the September 11 attacks and their aftermath. The direct experience of the attacks was mediated, and the fact that the attacks in New York took place in the world’s leading media center made the images available and accessible, live and in real time. Whatever national and international processes of existential reflection and ritual mourning ensued, those processes were largely mediated as well. Media were also implicated in

the widespread impression of distance and misunderstanding that was invoked. The media should be the primary means by which the developed West knows the Islamic East and vice versa. That the Islamic East was self-defined in large measure by religious identity places the media at the center of whatever misunderstanding may have led to or exacerbated the attacks. Further, a measure of the Islamic critique of Western culture is rooted in a moral reaction to the profanity and licentiousness found in the largely American popular culture that floods the developing world. Thus the media are taken to represent religious culture whether they intend to or not. Finally, the media were and are the primary context for the national and global rituals of commemoration and mourning around the event, thus assuming a role not unlike a “civil religion” in this regard.

IDENTITY, REFLEXIVITY, AND GLOBALIZATION. Beyond the evolution in media and religion already discussed, the convergence and interaction between religion and media in late modernity are responsive to a number of social and cultural trends. Three stand out. First, the convergence and interaction are most clearly felt in the project of the self and religious identity. As theorists of late modern social life have suggested, the project of the self is perhaps the dominant concern of the age. As social life has become more and more complex and rationalized, the means of support available in the social sphere have withdrawn, leaving individuals increasingly to their own devices. This has driven individuals inward, to a quest for the self. This quest turns outward, however, to seek and appropriate resources relevant to its task, and the commodities of the media sphere are among the most obvious and available such resources. To the extent that the project of the self is a religious project, this becomes an important role for media in the formation and shaping of religious identity.

The second of these trends is reflexivity. Prominent theorists of late modernity recognize the role of mediation in the encouragement of a reflexive mode of consciousness. Reflexivity results from the access to sources and contexts of knowledge that offer individuals a self-consciousness of place that is historically unprecedented. With this reflexive knowledge comes a sense of autonomy in spheres of normative action, including self and identity. In late modernity, mediation plays a major role in our knowledge of place and location, and thus is implicated in important ways in the reflexivity that today defines much of the religious quest for self and identity.

Finally, globalization and what is coming to be called “glocalization,” the blending of a global concept to a local application, are definitive trends. The media are major global and globalizing industries, of course, but their implications extend well beyond their structural and economic relations. To the extent that globalization is a fact, it results in large measure from the capabilities of the media to provide global interconnectivity, socially, culturally, and religiously. The media are, after all, “consciousness industries,” and among

their capabilities is the conveyance of cultural symbols, forms, and texts related to the deepest human desires for connection and belonging. They can transcend space and time, and frequently do provide, for a variety of “imagined communities,” a connectivity across space and time that is unprecedented in its depth and speed.

Increasingly, the media can be seen to be active in the negotiative frameworks that underlie glocalization as well. The media are no longer thought of as determinative or dominant, as noted. Instead, they provide, to reflexive individuals and communities, senses of the structured relations of local, national, and global life, and symbolic and other resources relevant to making sense of that life. This involves the constructive negotiation of that consciousness, those contexts and those resources. What results is an imbrication of the global and the local, a reflexive consciousness of place within those frameworks, and senses of self and group identity relevant to this awareness. Religion is a fundamental quest, as well as an important dimension of these relations. Thus religion and mediation interact in fundamental ways in the ongoing development of global and glocal consciousness.

But the globalized world is not only a place of harmony, it is also a place of conflict and struggle. Among the social and cultural relations increasingly accessible today are those between conflicting worldviews. In the case of religion, the media can and do offer much information about the religious “other,” but that does not necessarily lead to increased understanding. The Anglican Church, for example, learned during their struggles over gay ordination in the early part of the twenty-first century, that a global media context made those deliberations accessible worldwide, increasing the intra-communal tension as African Anglicans could have real-time access to the debates taking place among North-American Anglicans. As globalization and glocalization move ahead, international media will continue to place before religion challenges to self-understanding and inter-religious understanding.

MEDIA EFFECTS ON RELIGION. Given this discussion, there remain a number of ways that the media affect religious institutions and practices. First, the media increasingly set the context for religion and spirituality, and help define their terms in contemporary life. The 2004 film *The Passion of the Christ*, for example, both invoked a public debate about contemporary religious faith and presented a new set of images and symbols through which that aspect of the Christians’ story will be understood for years to come. The performer Madonna, through songs and music videos, presented influential interpretations and juxtapositions of important Catholic symbols and artifacts. Because of their position in the culture, the media are now the context within which the most widely-held discourses in national and global culture take place, and religion and religious discourses must find their way within that larger context.

A second effect of media on religion is in the area of commodification. Contemporary social and cultural experi-

ence is becoming increasingly commodified, and the media sphere plays a major role in this trend. Religion is not immune to commodification, and indeed, there is a long and deep history of it in some traditions. In the mass media age, it makes sense to think of culture as a marketplace of symbols and ideas. Cultural commodities of all kinds, including religious ones, are valued and exchanged in that marketplace.

The third effect of media on religion is in the consumption and reception of religious symbols and discourses. The secular media define the terms of access for religious and spiritual material as it enters the public sphere. In the field of contemporary Christian music, for example, the ability of religiously motivated musicians to “cross over” into the mainstream, a desire by some, is constrained by a set of expectations established by the conditions under which the public, secular, mass media operate. The primary one is the expectation that to be public, such material must appeal to general as opposed to narrower, sectarian tastes. In both popular music and book publishing, separate “lists” continue to be maintained.

The fourth effect, then, is that in this and many other ways, religions can no longer control their own stories if they wish to be present in the public sphere and in public discourse. The terms of reference, the language, the visual and linguistic symbols, and the conditions under which religion becomes public are all matters determined by media practice. It is possible for religious groups and individuals to remain separate from this process, but they then surrender opportunities to be part of the public culture. Even groups that aspire to separation, such as the Amish, find it increasingly difficult to do so.

This relates to a fifth effect, that it is no longer possible for religions to retain zones of privacy around themselves. Increasingly, and as a result of the reflexivity of late-modern consciousness, individuals today expect a level of openness from public institutions. As religious groups and movements interact with the commercial and governmental spheres, they begin taking on the attributes of publicness and are thus seen to be subject to media scrutiny, journalistic and otherwise. Both the Roman Catholic Church, in its struggles over scandals and vocations crises, and the Anglican Communion (and other Protestant bodies) as they face the question of gay rights, have found that the conversation is not and cannot be a private one any more.

A sixth effect is that, as was noted earlier, the media bring individuals the religious and spiritual “other.” In the context of globalization/glocalization, this is felt in the increasing cross-national and cross-cultural exchange of information, symbols, images, and ideas, circulated through journalism, through popular culture, and through the personal media of the digital age. In the context of the increasing international flow of persons, both through travel and through immigration, the media have become active in providing information about the “others” who are now arriving next door or in the next town. The media are now becoming the au-

thoritative context for interreligious contact and dialog. At the same time, they can and do provide information about some traditions that other traditions find to be scandalous.

A seventh effect of media has been discussed in some detail already. That is that the media are today a major source of religious and spiritual resources to the “seeking” and “questing” sensibilities that increasingly define religion in the developed West. This is related to an eighth effect, that it has been suggested that the media have the potential to support the development of “new” or “alternative” religions. This has been thought by some to be a particular potential of the new digital media. The Internet provides opportunities for interactive relations among focused networks of like-minded people. Thus they might well be a context where those networks could develop into religious movements of their own. This of course remains to be seen.

Finally, an effect of media on religion is the central role that the media play in national and global rituals around major public events. Beginning with the Kennedy assassination and continuing through royal weddings and funerals, crises such as the *Challenger*, *Columbia*, and Columbine tragedies, the death of the Diana, Princess of Wales, and of course the September 11 attacks, the media have come to accept a central role in a new civil religion of commemoration and mourning.

The relationship between media and religion is a profound, complex, and subtle one. While the media have grown in cultural importance over the past century, and religious institutions and movements have contemplated how to respond and experimented with ways of accommodating to this new reality, a relationship has developed that now determines, in important ways, the prospects and prerogatives of religion into the twenty-first century.

MEDICAL ETHICS. Religious beliefs are central to the process of deliberation in medical ethics. An awareness of the rich diversity of perspectives both within and among different religious traditions is critical to the development of respectful dialogue. This entry will focus on the religious traditions of Christianity, Judaism, and Islam. Readers interested in Hinduism are referred to S. Cromwell Crawford’s *Hindu Bioethics for the Twenty-First Century* (2003) and those interested in Buddhism are referred to Damien Keown’s *Buddhism and Bioethics* (1995).

OVERVIEW OF MEDICAL ETHICS. Medical ethics is the application of principles and rules of morality to healthcare (Clouser, 1974). It is a multidisciplinary field grappling with perplexing questions created by rapidly evolving scientific,

technological, and social developments. There is not a single systematic theory of medical ethics. Rather, medical ethics has matured into a discipline that is enriched by a plurality of voices from clinical medicine, religious traditions, philosophy, literature, politics, and the social sciences.

One of the earliest articulations of ethical guidance for physicians is the oath of Hippocrates, which dates from as early as the fourth century BCE. Two statements in the Hippocratic oath—“into whatsoever house you shall enter, it shall be for the good of the sick to the utmost of your power” and “you will exercise my art solely for the cure of patients”—are the basis for the well-known principle of “above all do no harm” when caring for patients (Dorman, 1995; Carey, 1928).

In contrast to the personal expression of ideal conduct embodied in the Hippocratic oath, in 1803 Thomas Percival published *Medical Ethics or a Code of Institutes and Precepts* (Percival, 2000). This code became the basis of the American Medical Association’s first *Code of Ethics* adopted in 1847 (Baker, 2000). The development of a code of ethics marked a radical transition from a personal ethic that focused primarily on elucidating the proper demeanor for physicians (Jonsen, 2000) to a collective professional ethic that renewed concern for the place of values in the practice of medicine.

By the middle of the twentieth century advances in medical science radically changed the ability of physicians to diagnose and treat illness. These developments created a moral crisis that cried out for a rethinking of the moral obligations of physicians. Notably, the condemnation of research without patient consent, codified as the Nuremberg Code in 1947, transformed the interaction of physician-investigators and patients in research. In 1950 an era of organ transplantation began, eventually forcing society to reassess the definition and criteria for death (*Defining Death*, 1981). In 1953 the structure of DNA was discovered and set the groundwork for the genetic revolution in the early twenty-first century. In 1961 hemodialysis became a reality, raising questions about the allocation of scarce resources and the appropriateness of using technology to prolong life. In 1973 the U.S. Supreme Court’s *Roe v. Wade* decision affirmed the right of a woman to obtain an abortion during the first trimester of pregnancy. The 1970s also ushered in vigorous debates about who should live and who should be allowed to forgo lifesaving treatment. These questions were stimulated by the seminal cases of Karen Quinlan (*Quinlan* 70 NJ, 335A2d, 1976) and Donald “Dax” Cowart (Kliever, 1989) and continued into the 1990s with questions about the ethics of euthanasia and assisted suicide (*Deciding to Forgo Life-Sustaining Treatment*, 1982; *Washington et al. v. Glucksberg et al.*, 1997; and *Vacco, Attorney General of New York, et al. v. Quill et al.*, 1997). More recently, greater emphasis has been placed on the quality of end-of-life care and how to improve it. The advent of managed care has invigorated debates on resource allocation and the role of physicians as managers. The twenty-first century heralded in an era of genetics with

the mapping of the human genome and questions about the acceptability of stem cell research and cloning (Shapiro, 1999; Nuffield Council on Bioethics, 2000). These questions are part of a gradual shift in the discipline from internal professional concerns to matters of public debate.

RELIGIOUS APPROACHES TO MEDICAL ETHICS. Theologians were among the first to contribute to the modern dialogue of medical ethics, and they were instrumental in shaping the emergence of the discipline (Callahan, 1990). Religious approaches to medical ethics share a common grounding of ethical positions in religiously based claims (Lammers, 1998; Williams, 1997). A brief discussion of the theological principles that guide each religion's vision of healthcare follows.

Catholic medical ethics. There is a long tradition of Catholic medical ethics dating from Augustine's writings on suicide and Thomas Aquinas's doctrine of natural law to modern-day directives on euthanasia and reproductive technologies (O'Rourke, 1999). The church's ethical and religious directives govern Catholic medical ethics (*Ethical and Religious Directives for Catholic Health Care Services*, 2001). The directives are grounded in the natural law approach of Catholic moral theology from which the church has derived its understanding of the nature of the human person, of human acts, and of the goals that shape human activity.

Fundamental to Catholic bioethics is a belief in the sanctity of life. Life is understood as a gift from God, and human beings are its steward (Wildes, 1997). The Catholic belief in the resurrection of Christ and an afterlife, however, influences the attitude toward life. Catholicism believes that human life and personhood begin at conception. Thus, a human fetus at any stage of development is a person who has a right to life. Central to Catholicism is a belief in a metaphysical conception of human beings as both body and soul. The presence of a living body, even if it has diminished or absent intellectual capabilities, is the defining characteristic of personhood. This belief has implications for ethical questions at the beginning and end of life.

As in most religions, there is a diversity of opinion within Catholicism. Richard McCormick has articulated a teleological ethic in which good is judged in relation to the common good. He argues for a proportionalist perspective in which an action viewed as evil might be justifiable if it brings about a good that is proportionate to or greater than the associated evil (McCormick, 1981b). This position is in opposition to Catholic beliefs in the absolute ontic nature of moral acts. McCormick has a dynamic understanding of Catholic theology that emphasizes an individualized and context-sensitive approach to moral problems (May, 1987 and 1994). According to McCormick actions should be judged based on what values they advance or denigrate within the context of an objective hierarchy of values (Rae, 1999). McCormick connects moral values to moral rights and duties. Thus the right to self-determination is linked to the moral value of human freedom.

Protestant medical ethics. Protestant medical ethics is rooted in the teachings of Martin Luther and such Reformation themes as "the freedom of a Christian," as well as biblical principles, such as love (Johnson, 1978). There are many strains of Protestant theology, and so there are diverse approaches to Protestant medical ethics. It is therefore difficult to define a uniquely Protestant approach to medical ethics, and most Protestants would view secular medical ethics as compatible with their personal religious beliefs (Pauls and Hutchinson, 2002). Paul Ramsey and James Gustafson are two prominent Protestant thinkers who have developed a Protestant approach to medical ethics. Ramsey develops an ethic that is rooted in the biblical concept of a covenantal relationship and the biblical conception of righteousness. His ethical positions are directed at meeting the needs of others (Ramsey, 1950). It is therefore not surprising that he focuses on the obligations of physicians to patients and those of researchers to human subjects. He leaves no room for consideration of the common good that might diminish the priority of care for individual patients. The individual's welfare is always first and foremost (Ramsey, 1970b). Ramsey also developed a phenomenological conception of Protestant natural law and argues that natural laws are discovered "in the course of active reflection upon man in the context of moral, social, and legal decisions" (Ramsey, 1962, p. 216). This is consistent with the historical Protestant emphasis on personal freedom and has contributed to the establishment of patient autonomy as a central concept within the moral framework of medical decision-making.

James Gustafson has emphasized the web of human relationships in which individuals are situated (Gustafson, 1965). The starting place for his ethical reflection is ordinary human existence rather than church doctrines or scriptural passages; nevertheless, Gustafson developed a theocentric ethic. Although he argued that Christian ethics should begin with human experience, human action should be judged primarily by the will of God and not by the welfare of human beings.

Jewish medical ethics. Jewish medical ethics is rooted in the application of the scriptural texts of the Five Books of Moses, the Talmud, codes of Jewish law, and the *responsa* literature to contemporary ethical questions in medicine. The Talmud is the primary sourcebook of Jewish law; it entails expositions and debates by rabbis about how to apply principles to different circumstances. The *responsa* literature is a compilation of written decisions and rulings by rabbis in response to questions posed about Jewish law. The questions are usually practical, and often concern new situations for which no provision had been made in prior codes of law. *Responsa* begin to appear in the sixth century CE, and all denominations within Judaism continue to formulate *responsa*. In recent years they have addressed many contemporary questions relating to medical ethics.

The presence of a well-defined corpus of religious legal texts does not mean, however, that there is one authoritative

Jewish position on questions of medical ethics. Within Orthodox Judaism (Freedman, 1999; Waldenberg, 1963) and among Orthodox, Conservative, Reform, and Reconstructionist Judaism there is a diversity of opinions on how to apply traditional sources to contemporary ethical problems. For some, Jewish medical ethics is constrained by the scriptural rules and precedents accumulated over thousands of years (Tendler, 1998; Jakobovits, 1975; Rosner, 1979). This approach is in tension with those who look more broadly at the values behind Jewish law and apply them to modern-day situations (Newman, 1995; Zohar, 1997; Gordis, 1989). What sources are selected and what methodological approach is used in the interpretation of traditional Jewish texts will influence the ethical decision that is reached. Jewish ethicists dispute fundamental questions about how concrete examples discussed in the Talmud can be extrapolated to modern-day questions in medical ethics.

In an effort to grapple with contemporary questions from a Jewish perspective, Elliott Dorff (1998) has articulated several fundamental beliefs underlying Jewish medical ethics. He argues that the following beliefs should inform the Jewish response to modern-day questions in medical ethics: a belief that human bodies belong to God, human worth flows from being created in the image of God, the human being is an integrated whole where body and soul are judged as one, the body is morally neutral and potentially good, there is an obligation to heal, and Jews have an obligation to engage in action that sanctifies God's name. Dorff thus puts forth a methodology of Jewish medical ethics that goes beyond strict legalism. He interprets Judaism's general rules not as inviolable principles, but as guiding policies that need to be applied with sensitivity to the contexts of specific medical cases.

Islamic medical ethics. Islamic medical ethics is based on *shari'ah*, Islamic law, which is founded on the Qur'an and the *sunnah*. The Qur'an is the holy book of all Muslims, and the *sunnah* contains aspects of Islamic law based on the prophet Muhammad's teachings. As in Judaism, Muslim scholars of religious law are called upon to determine religious practice and resolve questions in medical ethics. The application and interpretation of Islamic law is dynamic and flexible within the confines of a sacred set of values and texts (Van Bommel, 1999). In 1982 Abdul Rahman C. Amine, M.D., and Ahmed Elkadi, M.D., proposed an Islamic code of medical ethics that addresses many fundamental questions in contemporary medical ethics (Rahman, 1982). In Islam, life is sacred and every moment has value even where the quality of life is diminished. Full human life begins after the ensoulment of the fetus, and most Muslim scholars agree that this occurs at about 120 days after conception (Al Bar, 1986). A minority of scholars believes that ensoulment occurs at forty days after conception (Al Bar, 1995). Saving a life is considered a duty informed by the guiding principle mentioned in both the Qur'an and in the Talmud, "If anyone has saved a life, it would be as if he has saved the life

of the whole of mankind" (Qur'an 5:35; and Mishnah *Sanhedrin* 4:5). Death is considered to occur when the soul leaves the body, but since this cannot be determined with certainty, physical signs are used to diagnose death. The concept of brain death was accepted by a majority of Islamic scholars in 1986 (Al Bar, 1995).

REPRODUCTION. Many religious traditions share the assumption that human life is sacred. This understanding of life has implications for the permissibility of abortion. Catholicism's official opposition to abortion has been based on two fundamental beliefs (Pope John Paul II, 1995). One is the belief that a human fetus is a person from the moment of conception, and thus aborting a fetus is tantamount to murder. The Second Vatican Council (1962–1965) condemned abortion unconditionally as an "unspeakable crime" (Pope Paul VI, 1965). The second belief that underlies the Catholic position on abortion, contraception, and assisted reproduction is that sex is permitted only when it is integrated into marriage and has procreative intent. In opposition to the antiabortion stance of the church, some Catholic theologians have tried to revive a more liberal position that claims that the male fetus acquires a soul forty days after conception, while the female fetus only acquires a soul eighty days after conception (Dombrowski, 2000). This position is based on the teachings of Augustine of Hippo (354–430), and it is strikingly similar to Jewish understandings of the fetus, but it was never held as a universal truth by everyone in the church.

Protestant views on abortion are diverse. Conservative groups believe that life begins at conception; however, some liberal denominations are pro-choice, believing that freedom of choice is an important principle. Exceptions to the duty to preserve life include medical indications, pregnancy resulting from rape, or social and emotional conditions that would not be beneficial to the mother or future child (Gustafson, 1970).

In Jewish law an embryo is considered to be mere water until the fortieth day (Epstein, 1935–1952). This leads some to argue that abortion is permissible during the first forty days of pregnancy (*Responsa Seridei Esh*, 1966). A fetus has the status of a potential human life, and thus Judaism permits abortion under certain circumstances. Where the mother's life is in jeopardy, abortion is mandatory. The Talmud speaks directly to this question where it says: "if the fetus threatens the life of the mother, you cut it up within her body and remove it limb by limb if necessary, because its life is not as valuable as hers. But once the greater part of the body has emerged, you cannot take its life to save the mother's, because you cannot choose between one human life and another" (Mishnah *Ohalot* 7:6). Thus a fetus becomes a person when the head emerges from the womb. As with most questions in Judaism, there is a diversity of opinion on when abortion is permitted (Feldman, 1980; Lubarsky, 1984; Bleich, 1968). Some authorities permit abortion in the case of rape, and some will permit abortion in the first trimester

if the fetus would be born with an abnormality that would cause it to suffer. One Orthodox authority has argued that abortion is permissible until the end of the second trimester if the fetus has a genetic mutation that would be lethal and would cause great suffering (Waldenberg, 1980).

Islam discourages abortion, but permits it under certain circumstances. Abortion has been allowed after implantation and before ensoulment in cases where there are adequate reasons. However, many Shī'ah and some Sunnis have prohibited abortion after implantation unless the mother's life is in danger (Ebrahim, 1989).

END-OF-LIFE CARE. Advances in medical technology have made it possible to prolong life through the use of ventilators, artificial organs, intravenous feeding, and ventricular assist devices. The monotheistic religions of Judaism, Christianity, and Islam uphold a duty to protect life that is on temporary hold from God. These faiths have uniformly rejected suicide. Within the Catholic tradition the failure to use ordinary measures to preserve life is morally equivalent to suicide. This does not imply, however, that there is a duty to prolong life in all circumstances, regardless of the patient's condition. Catholic theologians have distinguished ordinary and extraordinary life support, arguing that a person is obligated to use ordinary measures but that there is room for choice with regard to the use of extraordinary measures (Cronin, 1958). The directives outline compassionate care for the dying, which includes pain management but also respects informed and competent refusal of life-sustaining treatment. McCormick argues that Catholic moral theory connects self-determination with the duty to preserve life, but it places limits on this duty. "Life is indeed a basic and precious good, but a good to be preserved precisely at the condition of other values" (McCormick, 1981a, p. 345). He affirms the right of competent patients to reject life-sustaining treatment, arguing that individual patients will be in the best position to determine which treatments have a reasonable benefit and which treatments are accompanied by an unreasonable burden. McCormick urges patients to make a proportionate, reasoned decision in considering the rejection of life-sustaining treatment. This would include a consideration of the value of preserving life, human freedom, and lack of pain (McCormick, 1981a, p. 399).

Gustafson argues that life is not an absolute value, and yet he is also quick to say that life is the "indispensable condition for human values and valuing" (1971, p. 140). Thus we should neither worship life nor should we be quick to end life. Gustafson puts forth four religious qualifications to consider about life and death: (1) Life is a gift since human beings are dependent creatures; (2) Only God is absolute, and human life is of relative worth; (3) Human beings are accountable to God and responsible for how they treat life; (4) Human beings are participants in life who must respond to the developments and purposes that are made possible by God (Gustafson, 1968).

Jewish perspectives on end-of-life care are also informed by a belief that human life is sacred, and thus the preservation of life surpasses almost all other commandments. Most would argue, however, that this belief does not translate into a mandate to preserve all human life under all circumstances and at all costs (Herring, 1984). Although hastening death is prohibited, if something is an impediment to the natural process of death, it is permitted to withdraw that impediment. For example, if a person is certain to die, and is only being kept alive by a ventilator, it is permissible to withdraw the ventilator, which is impeding the natural process of death. Judaism attempts to balance the thrust to prolong life and the recognition that life may become unbearably difficult and painful (Rosner, 1979).

Islam considers the intentional hastening of death to be the equivalent of murder and thus denounces suicide and assisted suicide (Ebrahim, 2000). Islam does not condone the secular concept of a right to die. Like Judaism, however, Islam acknowledges that when treatment becomes futile, it ceases to be mandatory. A patient may refuse treatment when it will not improve his condition or quality of life. Although continued medical care, including the use of a ventilator may not be required, hydration, nutrition, and pain control should not be withheld (Khomeini, 1998).

GENETICS. The completion of the finished sequence of the Human Genome Project in 2003 marks the beginning of a new era of genetic manipulation. The potential for disease prevention, early detection, and improved treatment of diseases for which there is an identified genetic basis, however, is accompanied by concern about the ethical, social, legal, and psychological implications of genetic information (Andrews et al., 1994). One of the most promising and controversial areas of genetics is stem cell research. Stem cells are unique in their ability to differentiate into any cell of the human body. They have been isolated from adults, aborted fetuses, and embryos shortly after conception, and many believe stem cells are the key to developing treatments and cures for some diseases. Others, however, argue that using these cells is the equivalent of taking a human life, and even if their use leads to saving lives, it is not morally permissible to destroy embryonic stem cells.

Embedded within religious perspectives on the use of stem cells and cloning are varying theological assumptions that each religion has about a human embryo, the religious duty to procreate, and the relationship between human beings and technology. These assumptions lead to varied conclusions about the permissibility of stem cell research and cloning.

The Catholic Church has been unequivocal in its denunciation of the use of embryonic stem cells. This position is based on the belief that human life begins at conception and thus embryos must be respected (*Donum Vitae*, 1987). Because Protestant theology is pluralistic, there is not a unified position on the use of embryonic stem cells. The general synods of the United Church of Christ have regarded human

embryos as due great respect, but they have not regarded embryos as the equivalent of a person (Cole-Turner, 1997). Other Protestant views consider the dangers of not respecting the weakest human being, namely the embryo, to be greater than any medical benefit that might be achieved through stem cell research.

Since Judaism does not consider an embryo to have significant moral status prior to forty days of gestation, the majority of Jewish authorities believe that embryos may be used for research (National Bioethics Advisory Commission, 1999; Breitowitz, 1996).

The successful cloning in 1996 of Dolly the sheep through the somatic cell nuclear transfer technique has raised the possibility of cloning humans. Some Catholic and Protestant thinkers have reiterated past opposition to cloning (Cahill, 1997; Verhey, 1994; Ramsey, 1966 and 1970a). The foundations of these claims are an opposition to “playing God,” the view that cloning represents a violation of the unitive aspect of marriage, and a belief that cloning is a violation of human dignity (Haas, 1997; Moraczewski, 1997).

However, some Protestant thinkers have expressed qualified support for cloning research and for creating children using somatic cell nuclear transfer techniques. This view is based on an understanding of the meaning of human partnership with ongoing divine creative activity. Ted Peters argues that human beings are called to “play human” and assume the role of co-creator through the acquisition of knowledge aimed at improving humanity (Peters, 1996). According to this view there are no theological principles that the cloning of humans necessarily violates.

Jewish perspectives on cloning are guided by the biblical injunction to procreate and “master the world” (*Gn.* 1:28). The fulfillment of this biblical mandate is understood as permitting people to modify nature to make the world a better place (Dorff, 1997). Cloning is one example of mastery over the world, and it is not theologically problematic in the Jewish tradition (Tendler, 1997; Luria, 1971).

The model of a partnership with God in the creative process also appears in Islamic thought (Sachedina, 1997). Understood in this light, cloning may in some circumstances be an example of using human creative potential for good. Islamic scholars have argued that scientific discovery is ultimately a revelation of the divinely ordained creation. Scientific knowledge is therefore understood as a symbol of God’s creation and an opportunity given by God to human beings (Hathout, 1997).

MEDICINE MAN SEE SHAMANISM

MEDITATION. The terms *meditation* and *contemplation* are applied to a variety of manifestations throughout the historical and cultural geography of world religions. *Meditation* and *contemplation* are used in English to translate a number of specialized terms in several different languages. Attention will be paid here to the etymologies of these terms in English, so that the reader may determine the suitability of their application to foreign terms. Some general categories through which meditative and contemplative systems can be described will be introduced.

Confusion sometimes arises when the words *meditation* and *contemplation* are used interchangeably. However, a working distinction between the two terms can be suggested. Meditation is considered preparatory and contributory to the achievement of contemplation. Meditation involves concentration, the narrowing of the focus of consciousness to a single theme, symbol, catechism, or doctrine, yet it remains cognitive and intellectual. Meditation is usually rumination on a particular religious subject, while contemplation is a direct intuitive seeing, using spiritual faculties beyond discursive thought and ratiocination. In the felicitous phrase of Richard of Saint-Victor, a Christian theologian of the twelfth century, "Meditation investigates, contemplation wonders."

The English word *meditate* comes from the Latin *meditari*. *Meditari* connotes deep, continued reflection, a concentrated dwelling in thought. Contemplation is derived from the Latin *cum* ("with") and *templum* ("a consecrated place"). Frequently, contemplation is itself a spiritual state and serves as the end of an ascetic quest. Particularly in the monotheistic traditions of Judaism, Christianity, and Islam, this state is sometimes considered tantamount to the beatific vision bestowed upon the individual through the grace of God. This distinction between *meditation* and *contemplation* will serve for an examination of the following materials, but the reader should bear in mind the difficulty of translating these concepts from one language and culture to another.

As for the morphology of the theories and practices indicated by the terms *meditation* and *contemplation*, it may be useful to mention some categories of spiritual discipline. Meditation leading to contemplation can be apophatic. Involved here is an emptying procedure, in which the individual systematically removes from consciousness any content that is not the object of the quest. In Christian mysticism, this type of path is referred to as the *via negativa*; it is also an important technique in Buddhism.

Other forms of meditation and contemplation may be termed cataphatic. In this type of practice, a specific image, idea, role, or deity is held in the mind's eye. The object of the individual is to assimilate, or to participate in some way with, the chosen object. Apophatic forms of meditation tend to be more speculative, cognitive, and intellectual, at least in their early stages. They tend to be centered in the mind. Cataphatic forms of meditation and contemplation, on the other hand, tend to be more emotional and devotional. They tend to be centered in the heart. In what follows, meditation and contemplation represent a continuum, with different systems and traditions illustrating shifting perspectives within a descriptive framework that opposes the apophatic and speculative to the cataphatic and affective.

WESTERN TRADITIONS. The practice of prayer has always held a central place in the Western traditions of Judaism, Christianity, and Islam. Although prayer may devolve into meditation and even into contemplation, these are more directly the concerns of the mystical and, in many instances, the monastic dimensions of these traditions.

Judaism. Meditation and contemplation in the Jewish tradition acknowledge the centrality and authority of the Hebrew scriptures. Reading and interpreting the Torah require concentration and discursive meditation. This meditation led to the development of commentary, such as the Mishnah and the Talmud, and schools came into being that fostered an experiential approach. Heavily influenced by gnosticism and Hellenism, this movement is referred to as *heikhalot* mysticism. Ascetical practices culminated in a contemplative ascent of the soul through seven heavens to reach its final home in a state of beatitude. The final state is viewed as one in which the mystic stands before the throne of God and sees and hears directly. There is no experience of mystical union, and God remains "wholly other." This tradition remained essentially cataphatic and nonaffective, although the symbolism of the ascent and the attainment of ecstatic consciousness is characteristic of Jewish contemplation.

A more immanentist approach to the contemplation of God developed within the Hasidic tradition. One can trace here the influence of Philo Judaeus, a Jewish philosopher of the first century CE who later was to have an important influence on Christianity. In Hasidic contemplation, the transcendent majesty of God is preserved by making the object of contemplation the *shekhinah*, or the spirit of the living God. God can be contemplated directly only at the end of the world, or the Day of Yahveh. The Jewish contemplative almost always retains a sense of the distance between himself and God. The quest ends not with mystical union but with a sense of adhesion (or being joined) to God, which is short of an actual union.

The qabbalistic school from the thirteenth century onward produced some major developments in the Jewish meditative and contemplative tradition. A major exponent of this school was the Spaniard Avraham ben Shemu'el Abulafia. He developed a meditative technique designed to release the

individual from bondage to the sensible forms and images that one must deal with in everyday life and that delimit the soul. Meditation is an avenue through which the soul can come to apprehend more than the forms of nature. Abulafia looks for a means to deautomatize the human faculties from the normal preoccupation with daily events. He seizes upon a system of meditation based on the Hebrew alphabet. The letters of the alphabet are sufficiently abstract so as not to preoccupy the mind with any specific meaning, but concrete enough to supply an object of intense focus and concentration. The letters of the alphabet are regarded by the meditator as constituents of the holy name of God. The meditator is instructed to combine and recombine the letters of the alphabet without any attempt to form words, thereby constructing a kind of nonrepresentational mystical logic. Such exercise produces interior freedom and detachment from natural objects and prepares the adept for the final achievement: the pure contemplation of the divine name.

Christianity. Meditation and contemplation, particularly within monastic circles, reached a high degree of differentiation and sophistication in the Christian tradition. The practices of the early church took form in an atmosphere influenced by Hermetic literature and the philosophy of Neoplatonism. Syncretic in nature, the Hermetic books present the theme of a mystical ascent to the knowledge of God. This important image (found also in Jewish mysticism) becomes central to the mysticism of Christianity. The idea of an ascent from the many to the One is taken over from the thought of the Neoplatonist Plotinus. Plotinus describes four movements in the ascent to divine knowledge: (1) purgation in the practice of virtue; (2) the development of thought beyond sense perception; (3) the transcendence of thought in the achievement of union; and (4) the final absorption in the One. In the Christian circles of third-century Alexandria, these non-Christian ideas came to be absorbed into the tradition and to exert an important influence. Two important figures of this development were Clement and Origen.

For Clement, meditation led to the apprehension of the intelligible realities and then, through *gnosis* as a gift of Christ, to hidden spiritual realities. Reflective reading of, and meditation on, the scriptures in order to discern this hidden meaning was important. Within this metaphorical framework, Origen introduces the symbol of a contemplative marriage between the soul and the Logos (Christ).

Anchortism, or withdrawal into the desert, was a form of spirituality in the early church that gave full rein to ascetic and meditative practices. Disengagement from the concerns of ordinary life provided a favorable atmosphere for the awakening of the spirit to the word of God. The austere life of the desert could produce a deep, inner quiet and was conducive to a life of continual meditation on the scriptures in an attempt to hear the word of God and to ascend the ladder of perfection through grace.

Within this context, as early as the third century, a life of constant prayer developed as an ideal for the anchorite.

The beginnings of the prayer of the heart, or the Jesus Prayer, are found here. The Jesus Prayer is an apothegm translated as “Lord Jesus Christ, Son of God, have mercy on me.” The first reference to this prayer comes from the seventh century. The practice of the Jesus Prayer became important in Eastern Orthodox spirituality and in the development of the movement known as hesychasm. Meditation came to be seen, in a movement away from Neoplatonism, as more properly centered in the heart rather than in the mind. Control of breathing and the fixation of the gaze were important ancillaries to the constant repetition of the apothegm. This tradition has survived down to the present day in its major center on Mount Athos, in Greece.

The sixteenth and seventeenth centuries in the Roman Catholic church were a period of rationalization and the systematization of meditative and contemplative processes. This movement looked back to a medieval interest in the methodology of meditation developed among the Franciscans. A major figure in this movement was Bonaventure (1217–1274). In his *De triplici via*, he gives an exemplary statement for Western Christianity on the three processes of meditation: purgation, illumination, and union.

Ignatius Loyola (1495–1556), the founder of the Jesuits, wrote a treatise entitled *Spiritual Exercises*, in which he outlines a progression in meditative practice. His notions of meditation may not be so exalted as others, but his methods are of interest insofar as they involve cataphatic visualization techniques that bear some resemblance to Hindu and Buddhist practices. For example, Ignatius’s fourth method requires that the practitioner choose a specific image, such as the passion or the resurrection of Jesus, and apply each of the five senses to that image. Thus, through seeing, hearing, smelling, tasting, and touching, the image is vivified in the consciousness of the meditator.

Teresa of Ávila (1515–1582) was a member of the Carmelite order. In her *Autobiography*, she narrates her meditative experiences and describes a period of spiritual desiccation followed by a series of ecstatic experiences. Teresa describes the latter in sexual images and draws upon the symbolism of the bride and the bridegroom, a symbolism that dates back at least to the time of Origen. In the *Autobiography* she catalogs degrees of meditation, using the symbolism of the husbandry of plants. She compares discursive meditation to watering the garden, bucket by bucket; recollection is analogous to the use of a water wheel, and quiet, to springs of water. Union is compared to a drenching rain.

Teresa’s contemporary and fellow Carmelite, John of the Cross (1542–1591), modified the three ways of meditation developed by Bonaventure. Purgation is retained but illumination is replaced, using the bridal imagery, with betrothal, and union with spiritual marriage. Both Teresa of Ávila and John of the Cross describe a stage in contemplation referred to as the “dark night of the soul,” an experience of alienation and isolation preparatory to illumination through the grace of God. This theme continues a long-standing tra-

dition of a vision of God that includes the perception of darkness.

A major figure of the French church involved in codifying meditation was Francis of Sales (1567–1622). In his *Introduction to the Devout Life*, he teaches a five-step meditation. The preparatory stage of meditation involves three steps: (1) placing one’s self in the presence of God, (2) praying for divine assistance, and (3) imagining a scene from the life of Jesus. The second step builds on the first through identification with those images that most affect the practitioner. In the third step feelings generated in the second are converted into acts of understanding and will. The fourth step involves thanksgiving and offering up the results of the meditation as a sacrifice, and petition for the putting into practice of the insights gained. The fifth step is the development of the “spiritual nosegay” or the preparation of some content of the meditation to sustain one in daily affairs.

Islam. The prophet Muḥammad (b. 570) considered his prophecy to be a continuation and reaffirmation of the Judeo-Christian tradition. The word *islām* means “submission” in Arabic; thus a Muslim is one who submits. Islamic theology emphasizes the transcendent majesty and unity of God. Humanity is considered to exist face to face with this transcendent majesty without intercessors. Humans are not expected to try to share the secrets of God.

In the more orthodox forms of Islam, daily prayer (*ṣalāt*) is one of the obligatory observances. Usually this prayer is conducted communally. Although it is also recommended that a Muslim perform *dhikr*, or remembrance of God, these practices are external formalities and not necessarily related to contemplation and meditation in the present sense.

By the eighth century, strict Muslim orthodoxy began to be challenged by Sufism, the generic term for Islamic mysticism. The Ṣūfī movement favored an interiorization and esotericization of the basic institutions of Islam. The orthodox religious attitudes of fear and obedience before the transcendence of God changed in Sufism to an attitude of ecstatic love of God and hope of union with him through a transcendence of the phenomenal self. Meditative and contemplative practices became an important part of this quest, and *dhikr* became a constant practice of the presence of God.

Ecstasy is the goal of the Ṣūfī path, and *dhikr*, in an expanded and intensified form, becomes a means to the goal. Techniques familiar in other traditions such as control of the breath, visualization of sacred words, and repetition of sacred phrases were adopted as important means to this end. The goal is termed *fanāʾ*, or annihilation of the lower self, which enables God through his grace to bestow on the mystic the rapture of union with him.

The Ṣūfīs developed sacred dance as a technique for the induction of ecstasy. The turning and whirling movements of the dance accompanied by hypnotic music and chanting of poetry bypassed the intellectual faculties and created a trancelike state of centeredness and concentration. The Mev-

levi order of Šūfis founded by Jalāl al-Dīn Rūmī institutionalized this practice as the foundation of its worship.

EASTERN TRADITIONS. Sophisticated psychologies and techniques of contemplation and meditation were developed within the spiritual traditions of India and China. These traditions, which antedate the beginning of the common era, developed independently until the introduction of Buddhism into China in the first century CE. Thereafter, India's techniques of meditation strongly influenced Chinese religious thought.

India. A concern for meditative asceticism, which runs through Indian religious history, can be traced as far back as the Indus Valley civilization of the third millennium BCE. Artifacts recovered from this civilization can be interpreted as representing individuals or deities in meditative attitudes.

Yoga. An early systematization of meditative technique is found in the *Yoga Sūtra* of Patañjali, dating from the third century BCE. Patañjali defines *yoga* as "the cessation of the modifications of the mind." This statement forms the basis of much of pan-Indian spirituality. The Yoga system is one of the classical *darśanas*, or "viewpoints," of Indian philosophy. The object of meditation and other ascetic practices is to still the mind and the emotions with which the individual usually identifies. When this is accomplished, consciousness can reflect the pure absolute spirit (or *puruṣa*), which is the principle of consciousness itself. Realization of the *puruṣa* as one's true and ultimate identity brings with it release (*mokṣa*) from the tendency to identify with temporal experience.

The mind (*citta*) in Yoga philosophy is considered to be the repository of *samskāra* (the root impressions of past deeds). These impressions are stored from present and past lives in unconscious layers of the psyche and, in turn, produce binding proclivities, good and bad habits, and all forms of limited vision and false identification, which modify and determine a person's life in the unenlightened state. The unenlightened mind is modified by its past ignorant experience and in turn perpetuates such modifications into the indefinite future. (This is the pan-Indian doctrine of *karman*, which becomes axiomatic for much of Indian spirituality.) Hence the importance of causing the modifications of the mind to cease so that the pure unconditioned spirit may become manifest in meditation.

A primary object of Yoga discipline is to bring the mind into a state of one-pointedness or intense concentration. Moral and ethical abstinences and observances form the first two limbs of an eightfold prescription for attaining this state. A comfortable posture (*āsana*) is recommended, especially one that enables the practitioner to keep the spine correctly aligned and one that can be comfortably held for protracted periods of time as the mind becomes abstracted from the body. Breath control (*prāṇāyāma*) is then recommended, since states of breathing and states of consciousness correspond closely to each other. A calming and quieting of the breath produces a corresponding calming and quieting of the mind.

As concentration deepens, the next limb of Yoga, *pratyāhāra* (withdrawal of the senses from their objects), contributes to a further interiority. The next step is *dharāṇa*, or the concentration of the mind on a single object. This is followed by *dhyāna*, or the achievement of an uninterrupted nonverbal current of consciousness focused on the meditative object. The eighth and last limb of this meditative program is *samādhi*, in which the goal of complete cessation of the modifications of the mind is achieved, and a transcendent awareness of one's ultimate identity as *puruṣa*, or unconditional spirit, is attained. In this state of ecstasy, the normal ego sense and the experience of a dichotomy between subject and object is overcome. Yoga discipline in a variety of forms becomes an important ingredient in several Indian spiritual traditions and religions, including Jainism, various forms of Hinduism, and Buddhism.

Hinduism. *Hinduism* is a generic term used to refer to a variety of religious manifestations within the Indian subcontinent and other areas subject to Indian influence. In the early history of Hinduism, a stage referred to as Brahmanism, there was a movement away from the practice of exoteric ritual and toward meditative interiority and realization. As the tradition developed, Hindus came to be divided into three main sects: the Vaiṣṇava, the Śaiva, and the Śākta.

Vaiṣṇavism. The Vaiṣṇavas, worshipers of the god Viṣṇu and his many incarnations, developed a form of active, affective, and cataphatic meditation in which chanting, singing, and dancing were used to induce transic absorption into the deity. Perhaps the most popular incarnation of Viṣṇu is the deity Kṛṣṇa, whose worship is *bhakti* ("devotion"). In addition to performances of chanting and dance, a devotee was expected to remain ever mindful of his object of devotion. In turn, the deity extends his grace and love to the devotee. In both Vaiṣṇava and Śaiva forms of theistic meditation, the emotions are given a much freer rein than in the more abstract classical Yoga system. Transmutation of the emotions through devotion to Viṣṇu, Śiva, and their *avatāras* became popular and had a far-reaching effect on Indian art and literature.

Devotional theism borrowed some of its elements from Sanskrit poetics. The term *bhāva*, which refers to an intense personal emotion in poetic theory, was adapted by the Vaiṣṇavas to refer to the meditative attitude that a devotee assumes toward Kṛṣṇa. There are four types of contemplative mood, determined by the form of relationship with the deity. These range from a relationship to Kṛṣṇa as supreme deity, as friend, as brother, and, perhaps most importantly, as lover. A devotee's chosen *bhāva* was to be cultivated through meditation, chanting, and dance until he experienced himself as the friend or lover of Kṛṣṇa. Continual absorption into these various roles enabled the adherent to experience the love and the personality of the deity.

Saivism and Śaktism. The devotees of Śiva developed their own forms of contemplative worship. One is the growth of a cult dedicated to Śakti, the female consort of

Śiva. Śakti is the active female energy of the universe in contradistinction to the passive contemplative energy of Śiva himself. Śaktism became an important part of the Tantric manifestations of Hinduism. Tantric Hinduism developed several techniques of meditation, including the use of the *yantra*. A *yantra* is a geometric diagram that represents an abstract form or manifestation of a deity. Deities are essentially formless in their own nature but are thought to manifest themselves in a movement from the subtle to the gross, in the forms of sound, the geometric forms of the *yantra*, and the *mūrti* (or sculpted) image. A *yantra* is a series of triangles, squares, and circles emanating from a central point, which serves to focus the mind of the meditating yogin.

Visualization of a sculpted or painted form of the deity became important in Tantric meditation. The object was to achieve a high degree of absorption in the outward form so that it could be reproduced in complex detail within the mind of the meditator. When this stage was reached the outward form could be dispensed with. The general goal of Tantric meditation is the complete unification of the body, speech, and mind of the Tantric yogin with the body, speech, and mind of his chosen divinity. *Mantras*, symbolic sounds or phrases for the sound form of the divinity, were used in this practice. *Mudrās* were used in meditation also as symbolic gestures of the hands and body representing various stages of the unification process.

In *kuṇḍalinīyoga*, the macrocosmic Sakti is further identified, within the microcosm of the human body, as *kuṇḍalinī*. *Kuṇḍalinī* literally means “coiled” and refers to the visualization of Sakti as an energy within the body in the form of a sleeping serpent. This energy is associated with a meditative physiology of the subtle body of the human. The meditator visualizes six vital centers called *cakras* placed along the spine from its base to the crown of the head. The *cakras* are connected to each other by a central vein with two lesser veins, or channels, on either side. The object of the meditation and physical exercises of this form of Tantric yoga is to wake the latent energy of Śakti coiled at the base of the spine and to cause it to enter the central vein. As *kuṇḍalinī* ascends and is drawn upward through meditation, it energizes the six *cakras* until it reaches the topmost *cakra*, where it is reunited with Śiva. At this point the body of the yogin and the body of the cosmos are resolved into the primal unity.

Buddhism. Buddhism is a tradition that seeks to penetrate the veil of appearances and social conditioning and, through meditative insight, to achieve a vision of the truth of reality. This vision leads to liberation from the round of karmic cycles and the achievement of ultimate freedom in *nirvāṇa*. *Nirvāṇa* is the goal of Buddhist asceticism subsumed under the term *bhāvana*, or meditation. *Bhāvana* has two secondary objectives: the first is the achievement of *śamatha*, or calm; the second is *vipāśyanā*, insight or higher vision.

As a foundation for other Buddhist meditation practices, a monk starts with the practice of mindfulness (Pali,

sati). This practice is basic to both *śamatha* (Pali, *samatha*) and *vipāśyanā* (Pali, *vipassanā*) and can be used for both calming and higher vision. The practice of mindfulness, or total awareness, takes place in four main areas: the body itself, the sensations, thought, and mental objects. Mindfulness of the body begins with the observation of breathing. Strict attention is paid to inhalation and exhalation, note being taken of the duration of each as the practitioner becomes aware of this usually unconscious activity. Such concentration involves narrowing of the mind's focus. The effects of mindfulness of breathing include a refined awareness of the entire body and a sense of tranquillity.

Mindfulness of the body is next applied to a monk's postures and movements. Every bodily action is performed with complete awareness and consciousness. This discipline brings into awareness bodily activity, which normally goes on beyond the conscious level. As activities are performed, mindfulness tranquilizes, calms, and controls the body; mindfulness can then proceed with an examination of the constituent parts of the body, external and internal, and a breakdown of the body into its primary physical elements. These practices break up any tendency to identify with the body.

Mindfulness is then applied to the sensations that are discerned as pleasant, unpleasant, or neutral. In a continuing progression, from the gross to the more subtle, mindfulness is then applied to the mind, or thought itself, and its objects. Attention is paid to each thought as it occurs, whether it is with or without such factors as passion, hatred, delusion, or freedom. The objective is detachment and a loosening of the tendency to identify with any factors of experience. With the achievement of detachment, the monk has an increased ability to respond actively to the actual circumstances of life.

Through concentrative attention, a monk sees the momentary quality of life, and sees that a moment of experience arises based on temporary causes and conditions. The monk thus can see the real nature of experience, which had previously been obscured by incorrect mental fabrications and the false projection of permanent identity on a transient stream of moments.

The Buddhist *śamatha* practices are associated with *dhyāna*, or the achievement of meditative absorption. *Dhyāna* practice continues the work of mindfulness into an even greater experience of detachment, one in which contact with the normal content of worldly experience is gradually attenuated and almost altogether eliminated. The *dhyānas* (absorptions) are as follows: four absorptions with form, four absorptions without form, and finally the cessation of conception and feeling. These stages represent a gradual elimination of the verbal, discursive, and affective contents of the mind. They lead a monk gradually out of the world of sense-based experience to a new, detached interior dimension. These stages are increasingly independent of the external world and signify a developing autonomy on the part of the monk. The monk is no longer bound by the accidental and

chaotic sensory stimuli of the world of ordinary experience or by intellectual concerns, and begins to acquire the power of turning away from the “given world” and toward the ability to “create” an interior world of attenuated, simplified, and peaceful content. This is the meaning of *śamatha*, the calming of the contents of consciousness, and the attainment of release from subjection to external circumstances.

Calming, transic absorption and insight are important features of Buddhist asceticism; they continue to be fundamental in both Hīnayāna and Mahāyāna schools. The Vajrayāna, or Tantric form of Buddhism, also developed elaborate visualization meditations in which carefully delineated images of deities, or *maṇḍalas*, were reproduced with great exactitude within the mind of the meditator. The Tantric form of Buddhist meditation became firmly established in Tibet.

China. Contemplation and meditation have held a position of high importance in Chinese religious traditions. This is particularly true of the indigenous Daoist tradition and the various schools of Buddhism imported from India.

Daoism. Daoism in its early literary form (here referred to as “classical Daoism”) and its later offshoot, which is usually termed “Neo-Daoism,” are usually thought of as the primary province of contemplation in the Chinese indigenous tradition.

Laozi (seventh century BCE?) and Zhuangzu (365–290 BCE?) are the two main figures of classical Daoism. Since their existence as historical figures is questioned, here they shall be referred to only by their works, now known as the *Laozu* (or *Dao de jing*) and the *Zhuangzi*. These two books contain the early formulation of the Daoist worldview and ethos. In Daoism there is a contrast between the superficialities of conventional reality and the insight achieved by the Daoist sage. The task of Daoist contemplation is to move from a partial and self-centered view of things to a holistic view of the cosmos and its spontaneously functioning dynamism.

The Dao is the primary object of contemplation and meditation in the Daoist tradition. It is the ultimate principle beyond phenomenal manifestations and yet within which all phenomenal manifestations are brought forth and undergo change. The first chapter of the *Dao de jing* emphasizes the ineffability of the true Dao:

The Dao (Way) that can be told of is not the Eternal Dao;
The name that can be named is not the eternal name.
The Nameless is the origin of Heaven and Earth;
The Named is the mother of all things. (Zhan, 1963, p. 139)

The Dao is the substratum that remains when all verbal and physical phenomena are discarded. Awareness of the Dao can be reached through apophatic contemplation and meditation, that is, only through direct meditative experience. In order to attain inner illumination, the Daoist sage has to follow a way of unknowing, of abandoning learning in favor

of looking directly into himself. Real education for the Daoist, in the phrase of Zhuangzu, is “sitting and forgetting.”

Buddhism. From the time when Buddhism entered China from India and Central Asia around the first century BCE, the Chinese were exposed to a bewildering variety of Buddhist teachings. The major Indian schools were represented, including the Madhyamika (Sanlun) and the Yogacara (Faxiang). Another school that developed in China, the Tiantai, promulgated an elaborate meditative regime based on a variety of scriptural sources. The Huayan school developed a teaching and meditative discipline that led to a vision of the harmony of totality and the mutual interpenetration of all things.

Two schools of Chinese Buddhism, the Chan and the Jingtu (Pure Land school), developed different understandings of meditation practice, a difference often referred to as that between “self-power” and “other-power.” “Other-power” refers to a reliance on the grace of a deity for the achievement of salvation, an idea characteristic of the Pure Land school. The idea behind this emphasis is that human beings are not strong enough to bring themselves to *nirvāṇa* through their own meditative practices. Paradoxically, an adherent of this school is advised to call on the name of the saving deity (Amitabha; Chin., Omītuō Fō; Jpn., Amida) with an undivided mind, thus constituting a mantralike form of apophthegmatic practice. Meditation in the “other-power” schools tends toward the affective and cataphatic.

“Self-power” schools, like Chan (Jpn., Zen) Buddhism, are more austere and apophatic. The word *chan* is a transliteration of the Sanskrit term *dhyāna*, which means “meditation” or “contemplation.” The Chan school emphasized “self-power” and sitting in formless meditation. Because of its exclusive emphasis on meditation, Chan developed an iconoclastic attitude toward other forms of religious observance. In Chan, personal enlightenment through intense meditation was the goal, and nothing was allowed to stand in the way of this pursuit, not even the religious and doctrinal trappings of Buddhism itself.

In Chan monasteries, meditation occupied a major part of the daily routine. Formal meditation usually took place in a separate building erected for the purpose and was supervised by a senior monk. Attention was paid to details of technique, including posture in the lotus position, with an erect spine, and the achievement of comfort and relaxation therein. Chan meditation focuses on the process of breathing, leading to a gradual withdrawal from external stimuli. A monk is instructed simply to observe the thoughts, feelings, and visions that may come into consciousness, and let them pass away of their own accord. When a monk is successful in detaching from both external and internal stimuli, the result is an experience of stillness and emptiness. This breaks up the tendency to identify with the body and mind and provides a new perspective on ordinary experience, marked by detachment, equanimity, and freedom from a sense of the ego as a reference point for experience. This is a realization

beyond doctrine and beyond words themselves. The semilegendary founder of Chan in China, Bodhidharma, is said to have described Chan as “a special transmission outside the scriptures; no dependence on words and letters; direct pointing at the mind of man; seeing into one’s own nature and the attainment of Buddhahood.”

PREHISTORIC EVIDENCE
HISTORICAL CULTURES

MEGALITHIC RELIGION: PREHISTORIC EVIDENCE

In Neolithic western Europe, large stones, or megaliths (from the Greek *me-gas*, “great,” and *lithos*, “stone”), were used for construction of tombs, temples, rings, alignments, and stelae. The largest number of some fifty thousand megalithic monuments are in Spain and Portugal, France, Britain, southern Sweden, and northern Germany. The terms *megalithic culture* and *megalithic religion* have been applied to the massive stone monuments. However, neither a separate megalithic culture nor isolated megalithic religion existed. The culture that produced megalithic monuments was a part of the western European Neolithic and Aeneolithic (a transitional period between the Neolithic and Bronze ages). It consisted of a number of regional culture groups whose religion can be understood in the context of the gynocentric Old European (i. e., pre-Indo-European) religion inherited from Upper Paleolithic times. Huge stones were used wherever they were readily available. Monumental architecture, motivated by religious ideas, emerged synchronically with the rise of a sedentary way of life.

Carbon-14 dating has established that western European megaliths were built over a span of at least three thousand years, from the fifth to the second millennium BCE. They were constructed earlier than the Egyptian pyramids and do not descend from forms in the Near East; the majority of archaeologists now believe that their development was indigenous. If there was any diffusion of ideas, it occurred along the seaboard and from the Atlantic coast toward the interior.

Megalithic structures fall into four main categories. The first is the temple, found in the Mediterranean islands of Malta and Gozo. Maltese temples have solid walls of very large stone slabs, and their floor plan has apses that recall the shape of a seated or standing goddess. The second and largest category of megalithic structures is the burial chamber, which is subdivided into dolmens (monuments of two or more upright stones supporting a horizontal slab), passage graves, court tombs, and gallery graves. Some passage graves are monumental buildings whose chambers have corbeled vaults; for example, Newgrange in the Boyne River valley, Ireland, which dates from 3200 to 3000 BCE, rises twenty feet above the ground. The third category is the single upright stone, or menhir (the word comes from the Welsh *maen*, “a stone,” and *hir*, “long”). Some of the menhirs found in Brittany are as high as six meters. A special kind of menhir, called a statue menhir, is sculpted to represent a divinity. The fourth category consists of grouped standing stones, placed either in rows or in elliptical rings.

Archaeologists once assumed that these megalithic monuments had evolved from simple to more complex forms, but the new chronology shows that some very elaborate buildings predate the simple gallery graves.

Temples and tombs were built in the likeness of the Mother of the Dead or Mother Earth’s pregnant belly or womb; this is the key to understanding megalithic structures

and their floor plans. The idea that caves and caverns are natural manifestations of the primordial womb of the goddess is not Neolithic in origin; it goes back to the Paleolithic, when a cave's narrow passages, oval-shaped areas, clefts, and small cavities were marked or painted entirely in red, a color that must have symbolized the color of the mother's generative organs. The rock-cut tombs and hypogea of Malta, Sicily, and Sardinia are usually uterine, egg-shaped, or roughly anthropomorphic. Red soil is found under each temple of Malta.

In western Europe, the body of the goddess is magnificently realized as the megalithic tomb. The so-called cruciform and double-oval tombs, as well as Maltese temples, are unmistakably human in shape. Some monuments replicate the ample contours of figurines of the pregnant goddess.

The earliest form of the grandiose chamber tombs is the passage grave, which consists of a corridor and principal chamber. The natural cave, with its connotations of the goddess's womb (vagina and uterus), was probably the inspiration for the aboveground monumental structures that were erected later. The basic form of the passage grave—a shorter or longer passage and a round, corbel-roofed chamber—dates from the fifth millennium BCE in Portugal, Spain, and Brittany.

The interior structures of many Neolithic court tombs found in Ireland are outlined in a clearly anthropomorphic form. In addition to a large abdomen and head, some structures have legs and even eyes. The term *court cairns* or *court tombs* comes from the semicircular entrance, built with large stones, that characterize these structures. In many instances, the court and one or more chambers attached to the middle of the edifice are all that remain of the cairn (De Valera, 1960, pls. ii-xxx). However, better-preserved examples show that the court marks the inner contour of the anthropomorphic figure's open legs; the chambers or a corridorlike structure next to it, which leads into the very center of the mound, represents the vagina and uterus. The same symbolism is manifested in different areas and periods. The Sardinian *tombe di giganti* of the third and second millennia BCE, consisting of a long chamber entered through the center of a semicircular facade, do not differ in symbolism from the Irish court tombs.

The other type of grave is a long barrow whose shape resembles that of a bone, a symbol of death. Like the court tombs, this type of grave has an entrance at the front that leads into an anthropomorphic or uterus-shaped chamber.

Megalithic monuments were built to be seen. Careful excavations and reconstructions have shown that much attention was paid to their outer walls and facades. For example, a reconstruction of a monument at Barnenez, Brittany, dating from the fifth millennium BCE (Giot, 1980), revealed a concentric series of walls with the upper parts of the internal walls visible. Another great structure, dating from the first half of the third millennium BCE, was reconstructed at

Silbury, Wiltshire, in southwestern England (Dames, 1976). Later excavations revealed that there were once wooden structures on top and beside the megalithic monuments that were just as important as the monuments. Postholes (indicating the presence of structures) have been observed in low barrows in Brittany, Britain, and Denmark. Traces of a timber facade, a porch at the front end of the barrow, and palisade enclosures have also been discovered (Madsen, 1979). The exquisite decoration in bas-relief on stones at entrances (as at Newgrange) implies that ceremonies took place in front of the cairns. Settlement debris in Irish court cairns has led some scholars to believe that chambered tombs and long barrows should be considered not burial places but shrines. However, excavations of megalithic chambers over the past two centuries have revealed skeletons, suggesting that the monuments served as repositories and were used collectively by the community. Some tombs have yielded as many as 350 disarticulated skeletons; others contain only 5 to 20 skeletons, discovered in compartments where they were placed after the flesh had decayed. In a few instances, skulls were found stacked carefully in corners.

Long cairns in Britain have yielded so-called mortuary houses, which were constructed of timber or stone and had plank floors. The rectangular mortuary houses found at Lochhill and Slewcairn contained three pits; the central one had two posts while the end pits held large split tree trunks (Masters, in Renfrew, 1981, p. 103). Mortuary houses are also known from Denmark (Becker, in Daniel and Kjaerum, 1973, pp. 75–80; Madsen, 1979). These mortuary buildings yielded deposits of charcoal, dark soil, cremated bone, an occasional child's skull, and flint tools, indicative of rituals including sacrifices. It seems that megalithic structures and long barrows, not unlike Christian cathedrals and churches, served as shrines and ossuaries. No doubt the large monuments, exquisitely built and engraved with symbols on curbstones and on inner walls, such as those at Knowth and Newgrange (O'Kelly, 1983), Ireland, and Gavrinis, Brittany, were sacred places where funeral, calendrical, and initiation rites took place. These monuments should be called not "tombs" but rather "tomb-shrines." The egg-shaped mound that covers the tomb-shrine of Newgrange is sprinkled with white quartz and looks like a huge egg-shaped dome. Probably it was meant to represent a gigantic cosmic egg, the womb of the world.

It is very likely that not all rituals were connected with death of humans and of all nature; some may have been initiation rites. Typically, the entrances to the tombs are narrow, resembling vulvas. One enters the mortuary house by either crawling or crouching along a narrow passage of stone. A wall of large curbstones, forming a forecourt, supports the mouth of the passage entrance on both sides. The structure may be a replica of the narrow and difficult entry into the mother goddess's womb.

In megalithic gallery graves of France, Switzerland, and the Funnel-necked Beaker culture in Germany, partition

walls sometimes have round holes. Their meaning is apparent if the still-extant veneration of stones with holes is considered; belief in the miraculous power of holed stones is still found in Ireland, Scotland, England, France, and in many other European countries. Trees with holes play a related role. By crawling through the aperture of a stone or tree, a person is symbolically crawling into Mother Earth's womb and giving oneself to her. Strengthened by the goddess's powers, he or she is reborn. The crawling constitutes an initiation rite and is similar to sleeping in a cave, that is, "sleeping with the mother," which means to die and to be resurrected. Well-known sculptures of sleeping women from the Hal Saf-lieni hypogeum in Malta, dating from approximately 3000 BCE, most likely represent such an initiation rite.

The pregnant mother's (or earth mother's) generative potential is emphasized by the symbol of a mound and omphalos (navel), which is found engraved or in bas-relief on stone slabs. For example, relief engravings completely cover the surface of twenty-three erect slabs within the passage grave of Gavrinis, rendering an overall impression of symbolic unity. This sanctuary, one of the richest megalithic monuments in Brittany, is situated on a small island in the Gulf of Morbihan. The extensive use of wavy and concentric arc motifs is in harmony with the monument's aqueous environment. The dominant symbol found in this sanctuary is the concentric semicircle, interconnected with or surrounded by multiple wavy lines and serpentine forms. Several slabs are decorated with concentric arcs, piled one on top of the other in vertical columns. The arcs in the center are larger than the rest and have an omphalos-like protrusion. In my opinion, this image is a glyph of the goddess's rising generative force. Emphasis is on the anthropomorphic vulva or cervix sign in the center. (For other illustrations, see Twohig, 1981, pp. 172–175.)

Symbolically related to the passage grave of Gavrinis is the roughly triangular backstone of a passage grave from La Table des Marchands in Brittany. It has a vulva at its center, flanked by energy signs—four rows of hooks—meant to stimulate the life source. This symbolism is similar to that found on ancient Greek vases, in which the young goddess (Semele, Gaia) is depicted within an artificial mound surrounded by satyrs, goatmen, and Dionysos, who stimulate her generative powers. On other passage-grave slabs, the symbol of an artificial mound surmounted by a knob is surrounded by axes, another energy symbol, or in association with serpentine lines or snakes and footprints. Still other engravings of the same image (called a "buckler" in the archaeological literature, where it has been seriously misunderstood) show wavy lines emanating from the upper part, which may signify the resurgence of plant life. The beehive-shaped chamber, topped with a flat stone, found in passage graves appears to be a pregnant belly and an omphalos. The so-called buckler sign replicates the same idea in an engraving.

In his analysis of the Silbury Hill monument, Michael Dames shows that in Neolithic Britain the hill functioned

as a metaphor for the goddess's pregnant belly (Dames, 1976). The entire structure forms an image of the goddess: the hill is her belly, the ditch forms the rest of her body in a seated or squatting position. The circular summit of Silbury Hill is the goddess's navel, or omphalos, in which her life-producing power is concentrated. Veneration of sacred hills was found in Europe until the twentieth century. Worship of the earth mother was celebrated on mountain summits crowned with large stones.

The second deity associated with the symbolism of the megalithic monuments is the goddess of death and regeneration in the guise of a bird of prey, usually an owl. Her image is engraved or modeled on statue menhirs, slabs of passage and gallery graves, and on walls of subterranean tombs. She herself, her eyes, or her signs appear also on schist plaques, phalanges (bones of toes or fingers), and stone cylinders laid in graves.

The characteristic features of the owl—round eyes and hooked beak—can be seen on the statue menhirs of southern France and Iberia, as well as in reliefs and charcoal drawings in the hypogea of the Paris Basin. The face is frequently schematized as a T shape or depicted with only eyes and brows or with a square head, surrounded by chevrons, in the center of the forehead. On the slabs of gallery graves of Brittany, only breasts and necklaces are shown in relief as *pars pro toto* of the owl goddess. The images of the owl goddess on schist plaques in the passage graves of Portugal have a prominent nose or beak, schematized arms, three horizontal lines or bands across the cheeks, occasional indications of a vulva, and a chevron design on the back. The goddess's owl face appears on a very fine sculpture discovered at Knowth West, Ireland. Her visage is immersed in a labyrinthine design probably symbolic of the life source or life-giving waters; a vulva is in the center. Images of the owl goddess on vases from Almería in Spain are at times associated with a honeycomb design—a maze of Vs, triangles, and lozenges.

The symbols associated with the owl goddess—wavy lines, hatched or zigzag band, net, labyrinth, meander, honeycomb, tri-line, hook, ax—all seem to be life-source, energy, or life-stimulating signs. Their association with the owl goddess emphasizes regeneration as an essential component of her personality. The agony of death is nowhere perceptible in this symbolism.

The round eyes of the owl goddess stare from bone phalanges and stone cylinders deposited in megalithic tombs in Spain and Portugal. The eyes and brows are incised in the upper part of the bone or stone cylinder and are surrounded by chevrons, triangles, zigzags, and nets. Again, the symbols of death (bones, light-colored stone) are combined with aquatic, life-source symbolism.

The goddess's impressive, divine eyes gave rise to one of her names, which came into use after the publication of *The Eye Goddess* by O. G. S. Crawford in 1957. The goddess of the title was said to have originated in the Near East, her

cult then diffusing across the Mediterranean to western Europe. Indeed, the resemblance of figurines from the temple of Tell Brak, eastern Syria (c. 3500 BCE), with their staring eyes and brows joined over the beak, to the stone idols of Spain and Portugal with their oculi motif is astonishing. The similarity, however, most probably resulted from a universally held symbolic concept of divine eyes, from which western variants developed. The western European eye goddess dates from the fifth and fourth millennia BCE (in Crawford's day considered to be the third and second millennia BCE). She has close parallels in southeastern Europe and certainly cannot be an imported goddess.

Small stone hourglass figurines, sometimes with triangular heads, are frequently found in Iberian megalithic tombs of the Los Millares type, dating from the end of the fourth or early third millennium BCE. Hourglass figures also are painted on Neolithic cave walls in Spain and are engraved on stones of Irish passage graves. The shape may have originated as a doubling of the pubic triangle (vulva) sign, connected at the tip. In Sardinian hypogea, vulva and hourglass signs are interchanged. Engraved triangles and hourglass shapes also appear to be associated on Irish megaliths. Not infrequently, hourglass symbols are engraved in triunes or next to three encircled round holes, as on Curbstone 52 from Newgrange. The number three may reflect the triple nature of the goddess. In vase painting, the hourglass sign appears in association with nets, serpentiforms, and snake meanders, which link this symbol with the life source and water of life symbolism. Bird feet or claws that appear attached to some hourglass figures on vases of the Cucuteni culture (northeastern Romania and western Ukraine) and of the Sardinian Ozieri culture speak for the association with the bird-of-prey goddess. The hourglass shape itself may symbolize an incipient form of life in which the goddess of death and regeneration emerges from graves or caves. This sign is related to the butterfly, a horizontal hourglass and symbol of new life. The origins of the goddess's image as a bird of prey are rooted in the Paleolithic, as is documented by portrayals of owls in Upper Paleolithic caves and by the large birds and wing bones of large fowl found in Paleolithic graves.

Disarticulated skeletons and skulls in megalithic tombs are proof that excarnation was practiced. Corpses were offered to the goddess, who was embodied in birds of prey. This practice is illustrated in frescoes of vulture shrines of Çatal Hüyük, central Anatolia. Large birds were also buried in megalithic tombs, probably as sacrifices to the goddess. Excavations have uncovered a large deposit in a chambered tomb at Isbister in Orkney, Scotland. The greatest number of bones came from the white-tailed eagle. Others were from short-eared owls, great black-backed gulls, rooks or crows, and ravens (Hedges, 1983). All these birds feed on carrion.

Geometric engravings on Irish megaliths—crescents, circles, and concentric circles; serpentiforms or zigzags with thirteen to seventeen turnings (the number of the moon's waxing days); subdivisions into four, six, or eight and

twelve—suggest a preoccupation with the cycles of time. The involvement of the goddess in configurations of cycles of nature and human life is certain. She must have been the overseer and controller of life and moon cycles.

Many western European tomb-shrines have been constructed so that the entrances align with the winter solstice. The alignment of tomb entrances according to the moon's position at the winter solstice suggests the importance of lunar influences on burial customs and suggests the association with the lunar goddess, who was a cosmic regenerator. These monuments were not built to serve as lunar or solar observatories, as claimed by A. Thom (1979) and other scientists writing on the importance of megalithic astronomy. Rather, their orientation according to lunar and solar phases served essentially for the regeneration of life. Rebirth was in the power of the goddess. In megalithic symbolic art we see the link between the time-measuring symbols and the symbols of her regenerative power, between sundials and divine eyes, and between the gnomon and the cupmark, symbols of the life source and rebirth. Other associated symbols are expressions of regenerative aquatic or plant forces.

Ceremonial ships are engraved on inner tomb walls in megalithic tombs in Brittany and Ireland. All depictions of ships are highly abstracted; some are just a row of vertical lines connected by a bar at the bottom. However, frequently there is a zoomorphic or spiral head, probably that of a serpent, on the keel. Sometimes an abstracted image of the goddess is shown being pulled by what may be a snake or ship. If the ship and serpent are interchangeable symbols (as they are on Egyptian artifacts and on Scandinavian rocks from the Bronze Age), then many winding serpents engraved on tomb walls are life-renewal symbols. Perhaps it is not accidental that some of the winding snakes a and zigzags in Knowth and Newgrange are joined to a triangle or lozenge (two triangles joined at their bases), the special signs of the goddess of death and regeneration, just as the feet of the birds of prey are attached to the prow of the ship on Cycladic platters dating from the middle of the third millennium BCE.

Folk stories associate megalithic tombs with fearsome goddesses, such as the goddess Gráinne, the Old Hag of Celtic myths (Burl, 1981, p. 66). The original meaning of *Gráinne* is "ugliness." Some cairns are said to be composed of stones dropped from the apron of the Old Hag. At least forty chambered tombs in Ireland are nicknamed "Diarmaid and Gráinne's Bed." The passage grave at Knockmany, County Tyrone, is called "Annia's Cave," a reference to the home of the hag Anu, guardian of the dead. Breast-shaped hills in County Kerry, Ireland, are still called the "Paps of Anu." Anu is related to the Breton goddess Ankou ("death") and to other death goddesses with similar names (such as the Slavic *Yaga*, from **Enga*; the Proto-Samoyed **Nga*; the Near Eastern *Anat*, etc.). Thus the lunar goddess represented in figurines as the White Lady, or Death, is still alive in folk memories.

In sum, the art of the megalithic monuments reveals the association with the two aspects of the prehistoric Great Goddess, the chthonic and the lunar. The underlying idea of the ground plan and shape of the monuments was the belief in the self-creating Mother Earth who was also the Mother of the Dead. The sculptures (figurines and stelae), bas-reliefs, and engravings represent the lunar goddess in an anthropomorphic shape as White Lady (Old Hag) and in the guise of a bird of prey, usually the owl. This second aspect is the other side (the side associated with necrosis, night, and winter) of the life giver in anthropomorphic or water-bird shape.

MARIJA GIMBUTAS (1987)

MEGALITHIC RELIGION: HISTORICAL CULTURES

Megaliths are simply monuments built of large stones. In Southeast Asia and Oceania, a variety of megaliths are found, some thousands of years old, others brand new. Early studies of these structures viewed them primarily in the context of theories suggesting prehistoric migrations of megalith builders. In 1928 the eminent Austrian archaeologist Robert Heine-Geldern wrote the first of a series of influential articles, in which he argued that megaliths were created during two great waves of prehistoric migrations into Southeast Asia. The first group, the "Older Megalithic Culture," was thought to have ushered in the Neolithic age, while the second, the "Younger Megalithic Culture," was credited with the introduction of metal.

Heine-Geldern's view of megaliths as stepping-stones by which archaeologists could trace prehistoric migrations dominated Southeast Asian archaeology for many years, giving rise to extensive debates on the "problem of megaliths." In the past few decades, however, fresh waves of archaeologists, equipped with superior tool kits for prehistoric research, have passed over the territory first explored by Heine-Geldern. As the picture of prehistoric Southeast Asia became clearer, Heine-Geldern's theory of migratory megalith builders had to be abandoned. Several prominent archaeologists subsequently issued a joint statement, for the benefit of those

who might not have kept up with the current state of archaeological research, that “the label ‘megalithic culture’ cannot reasonably be applied to any of the phases or levels of social integration recognizable in the recent or prehistoric past of South East Asia” (Smith and Watson, 1979, p. 253). In the wake of the reaction against comprehensive theories linking megaliths to prehistoric migrations, little effort has been made to sort out the historical relationships among the various builders of megaliths in Southeast Asia and the Pacific. But, as we shall see, megaliths play an important role among many societies in the region, particularly those which share a common Austronesian cultural heritage. As Peter Bellwood, a leading authority on Pacific prehistory, observed recently, “The wide occurrence of megalithic monuments and statues in Oceania suggests that their origins may go very deep into the Austronesian past, possibly at least into the first millennium B.C.” (Bellwood, 1978, p. 226).

Many types of megaliths are found in the Indo-Pacific region, including menhirs (erect stones), dolmens (flat stones resting on two stone pillars), stone seats, stepped stone pyramids, and various types of stone tombs and sarcophagi. Active megalithic traditions exist today on several Indonesian islands, possibly related to megalithic customs still found among hill tribes of Northeast India such as the Nagas. In Southeast Asia, the most elaborate and well-documented megalithic traditions are found on the island of Nias, which lies about seventy miles off the northwest coast of Sumatra. In Nias, stones were put to many uses, foremost among them being the large menhirs and dolmens erected as monuments to chiefs.

In 1907 a Dutch colonial administrator, E. E. W. G. Schröder, photographed the erection of a dolmen as a monument for a chieftain who had died the previous year. A rectangular stone forty centimeters thick, three and one-half meters long, and two meters wide was dragged by means of logrollers from a quarry to the summit of a hilltop village, a distance of about two kilometers. There it was set on two stone pillars outside the former chief’s house as a monument to his glory and as a home for his spirit, whenever the chief might choose to visit the village. The project was organized by his son and successor, who mobilized 525 kinsmen and allies to transport the stone. Schröder’s dramatic photographs show the chief’s son atop the stone as it is being dragged uphill; he is wearing a warrior’s costume and waving his sword.

Such megaliths, called *darodaro*, were personal monuments erected about a year after the death of a chief by his kinsmen and allies. Often the chief’s skull was placed in a niche in the *darodaro*, along with his sword and other regalia. The larger the *darodaro*, and the more people who participated in dragging the stone and celebrating the funeral feast, the greater the chief. The same logic also applied to a second type of megalith erected in honor of chiefs, the *batu nitaru’o*, which was an upright stone or menhir placed in front of a living chief’s house. The erection of such monuments were

important political events, with roots in the fundamental structure of Niasian chiefdoms. Niasian society was divided into patrilineal descent groups, and rank order within each lineage was determined by a cycle of feasts. Every adult male had to give the first six feasts in the cycle. But the “heads” (*ulu*) of lineage branches had to give up to six additional feasts, each more elaborate than the last. Each man would invite to his feasts his personal *öri* (“circle”)—a circle of kinsmen, friends, and allies linked by marriage ties or reciprocal feasting. The supreme feast, given only by lineage heads, drew together an *öri* of several lineages and villages, and established the boundaries of a chiefdom: a chiefdom was nothing more than the *öri* of a chief. This supreme feast was called the *batu nitaru’o ba wa’ulu* (“chief’s feast of the *nitaru’o* stone”). The larger the stone, the more people belonging to the chief’s *öri* who participated, the greater the chief. Political authority was not vested automatically in a man born as a lineage head; it had to be demonstrated through the feast cycle. The *öri* of the chief whose funeral Schröder photographed included sixteen villages.

In addition to the chief’s monuments, Niasians also erected smaller megaliths for a variety of purposes related to their belief that stones provided temporary shrines for various spirits. Each village had its *batu banuwa* (village stone) celebrating the origin of the village. Childless women, especially those of high rank, were considered likely to become dangerous ghosts. So they were often provided after their deaths with small *darodaro* in case they should visit the village. Schröder, who spent several years exploring the island in the first decade of this century, recorded a wide variety of megaliths in different villages. In one village, stones had been placed near a bathing place “for the spirits to dry their clothes.” In another, he found stone seats with footprints below for childless women, because “she who dies without children leaves no footprints on the earth.”

The advent of Christianity brought an end to most of the megalithic customs of Nias in the past few decades, but on the island of Sumba three thousand kilometers to the southeast, megaliths even larger than those of Nias continue to be erected in honor of important chiefs. On Sumba, there is no parallel to the Niasian *batu nitaru’o* (the stones erected by living chiefs), but the death of a chief calls for the erection of a stone sarcophagus reminiscent of the *darodaro*. Like the Niasians, the Sumbanese usually build their villages on hilltops, and the center of the village is dominated by an array of these megaliths, which may weigh as much as thirty tons. Stones (*ondi*) are cut from native limestone, and placed atop a wooden platform (*tena*) which the Sumbanese liken to a ship, complete with a figurehead in the shape of a horse’s head. Dragging the stone to the village may take weeks and call for the efforts of several hundred men. As in Nias, a chief (*rato*) stands on the stone and gives directions. Stone dragging is dangerous, and responsibility for managing things so that the stone does not slip and kill or injure someone rests with the chief. Every day, numbers of water buffalo and pigs must be slaughtered to feed the whole party.

As in Nias, Sumbanese social organization is based on alliances between clans, and the strength of an alliance is demonstrated by the number of allies who arrive to participate in the megalithic funeral, bringing gifts of water buffalo and pigs. As many as a hundred buffalo and pigs may be slaughtered for a major funeral, their horns and jawbones later tied to the chief's house as mementos of the feast. The more such trophies, and the larger the stone slab, the greater the chief. At the conclusion of the funeral, the chief's body is placed in the tomb and his favorite horse is killed so that the horse's spirit may lead him to the spirit world.

A different sort of megalithic tradition is found on the island of Bali, a tradition nicely exemplified by a chance discovery made in 1935 by the first archaeologist to work in Bali, William F. Stutterheim. Near a spring sacred to the early Hindu kings of Bali, he found a stone with a weather-worn inscription.

None of the Balinese could decipher the old engraved letters, nor were the contents of the inscription known to anyone. The stone stood there, as every villager of Manukaya knew it from childhood, wrapped in a white cloth and provided with regular offerings. I was told, however, that on the fourth moon of every year, at full moon, this stone (which is also said to have fallen from the sky) is carried to the holy waters of Tirta Mpul and bathed therein—much to the detriment of the stone, by the way, which is a big slab of soft grey tufa covered as usual with a thin layer of cement. Deciphering the inscription, I found that it was none other than the charter of Tirta Mpul's foundation, made in the fourth month, at full-moon day, in the year 962 A.D. Thus the people have kept alive the connection between the stone and the watering place for a thousand years, and have always celebrated its anniversary on the correct day, but of the true meaning of this connection every recollection was lost. (Stutterheim, 1935, p. 7)

Bali is now famous as the last surviving Hindu-Buddhist civilization of Indonesia. But the stone of Manukaya draws our attention to deeper, pre-Hindu roots of Balinese religion. Although the Balinese worship Hindu gods, they do so in temples that resemble ancient Polynesian *marae* much more than traditional Indian temples. Balinese temples, like Polynesian *marae*, are basically rectangular walled courtyards open to the sky, with a row of menhirlike shrines at one end. While the Balinese shrines may be much more elaborate than those typical of Polynesia, occasionally replacing stone with wood, the two types of shrines perform the same function of providing a temporary resting-place for visiting spirits of gods or ancestors. Both Balinese and Polynesians believe that the gods are not continuously present, but temporary, invisible visitors who like to alight in menhirs or similar objects for brief visits. Even the details of worship are often quite similar—both Balinese and ancient Polynesians wrapped cloths around the stones for important festivals. Unlike the Balinese, but very much in the spirit of the Niasians and Sumbanese, the ancient Polynesians buried important chiefs within their temples, and sometimes consecrated them with human sacrifices.

The largest Polynesian *marae* were stepped stone pyramids, of which the greatest was the *marae* of Mahaiatea in Tahiti (now destroyed). Mahaiatea was a rectangular pyramid of eleven steps, with a base measuring eighty-one meters by twenty-two meters. Similar structures were once common in Bali, such as the village temple (Pura Desa) of the village of Sembiran, although in Bali such pyramids may be interpreted in a Hindu idiom as *prasada* ("cosmic mountain").

We have noted several common uses for megaliths in the Indo-Pacific region—as tombs and monuments to the power of chiefs, and as temporary shrines or resting-places for ancestral spirits and gods. In Polynesia, we encounter also a different type of megalith, the importance of which is only beginning to be recognized—navigational "sighting stones." These stones, which are found on several islands, appear to have served three related purposes: as markers to align beacons (watch fires?) for ships sailing to neighboring islands; as the centers of navigational schools where students could learn the movements of useful stars by watching star after star appear at a particular point on the horizon marked by a stone, according to the seasons; and as timekeeping devices, predicting the position of sunrise and sunset at the solstices. For example, on the island of Arorae, in the Kiribati (Gilbert Islands), nine stones at the northernmost tip of the island point accurately toward three neighboring islands. Each stone points about five degrees out, perhaps to allow for the drift caused by the equatorial current in different seasons. Although no longer in active use, these megalithic "sighting stones" may have played an important role in prehistoric Pacific voyaging. Much remains to be learned about the functions of these stones and the other megaliths of the Indo-Pacific.

BIBLIOGRAPHY

There are two useful references for locating sources on particular megalithic customs. For Southeast Asia, see H. H. E. Loofs's *Elements of the Megalithic Complex in Southeast Asia: An Annotated Bibliography* (Canberra, 1967), which reflects, however, an outdated theoretical perspective. For Oceania, the literature on megaliths is surveyed in Peter Bellwood's comprehensive *Man's Conquest of the Pacific* (Oxford, 1978). More recent information on megaliths in Southeast Asia is contained in R. B. Smith and William Watson's *Early South East Asia* (Oxford, 1979), in which Glover, Bronson, and Bayard comment on Christie's presentation of the "Megalithic Problem." The megalithic traditions of Nias are described and illustrated in exemplary detail in E. E. W. G. Schröder's *Nias: Ethnographische, Geographische, en Historische Aanteekeningen* (Leiden, 1917). A brief summary in English based on Schröder may be found in Edwin M. Loeb's *Sumatra: Its History and People* (1935; Oxford, 1972), which also contains an appendix by Robert Heine-Geldern on "The Archaeology and Art of Sumatra," summarizing his views on megaliths. On navigational stones in the Pacific, see Brett Hilder's article in *Polynesian Navigation*, edited by Jack Golson (Wellington, 1963), and Thomas Gladwin's *East Is a Big Bird: Navigation and Logic on Puluwat Atoll* (Cambridge, Mass., 1970). Sumbanese megalithic customs are outlined in

Christiaan Nooteboom's *Oost-Soemba, Een Volkenkundige Studie*, Proceedings of the Royal Anthropological and Linguistic Institute, no. 3 (The Hague, 1940), and in Janet Alison Hoskins's "So My Name Shall Live: Stone-Dragging and Grave-Building in Kodi, West Sumba," *Bijdragen tot de Taal-, Land- en Volkenkunde* 145 (1986): 1–16. William F. Stutterheim's *Indian Influences in Old-Balinese Art* (London, 1935) sketches the major monuments of ancient Bali.

J. STEPHEN LANSING (1987)
Revised Bibliography

MEHER BABA (1894–1969), born Merwan Sheriar Irani, was a spiritual master who declared himself the avatar (descent of God into human form) of this age. Beginning in 1925 he observed silence for the rest of his life, communicating at first by pointing at letters on an alphabet board and later through hand gestures. Meher Baba (Compassionate Father) stated that his silence and the breaking of his silence would bring about a universal transformation of consciousness through a release of divine love in the world.

Meher Baba was born on February 25, 1894, in Pune, India, into a Zoroastrian family of Persian descent. In 1913, while attending Deccan College, he met the first of five "perfect masters" (fully enlightened or God-realized individuals), who made him aware of his identity as avatar. Stating that he had come "not to teach but to awaken," Meher Baba demonstrated the essential oneness of all life through acts of love and service. Throughout his life he served the poor, the physically and mentally ill, the "God-intoxicated" aspirants whom he called *masts*, and others in need. He indicated that his outer activities were symbolic of the inner awakening that constituted his real work. Giving no importance to the divisions of caste or creed, he drew followers from many faiths and social classes.

In the early days of his mission, Meher Baba forewarned his disciples that his "universal work" would require of him great suffering, including the shedding of his blood on American and Indian soil. Outwardly, the suffering took the form of two automobile accidents, the first in the United States (1952) and the second in India (1956). In one the entire left side on his body was injured, and in the other the entire right side was severely damaged. In spite of his suffering, Meher Baba gave *darshan* (personal blessing) to thousands of people during the 1950s and early 1960s.

Since his death (the "dropping of his body") on January 31, 1969, Meher Baba's worldwide following has grown

modestly in the West, especially in the United States, Europe, and Australia, judging by the number of people attending gatherings devoted to Meher Baba in those countries. More rapid growth has taken place in India. It is difficult to calculate the precise number of followers around the world because there is no formal membership or central authority. Many Meher Baba devotees remain active participants in the world's major religious traditions. Nevertheless, a variety of organizations have been founded in his name in the West and East to spread his message of divine love and the oneness of all life.

Meher Baba's followers (often called "Baba lovers") attempt to heed his wish to found no new religion or sect by resisting efforts to impose any one creed or interpretation of his writings. They feel themselves to be in an individual lover-beloved relationship with Meher Baba, believing that he inwardly guides them in their spiritual journey to eliminate the ego (false self) and to realize God as the "true Self." Many of his followers gather informally in groups to share experiences of his love and guidance and to discuss his life and work.

Among Meher Baba's close circle of companions, Mehera J. Irani was his chief woman disciple, a role Meher Baba compared to that of Sītā for Rāma and Rādhā for Kṛṣṇa. During Meher Baba's lifetime, Mehera was strictly cloistered from the outside world. After his death, Mehera played a more public role, greeting pilgrims and sharing stories of her life with Meher Baba. Mehera passed away on May 20, 1989, and is buried next to Meher Baba at Meherabad, near Ahmednagar, India.

Two sites associated with Meher Baba's life have become places of pilgrimage for his followers. The most important is his tomb shrine at Meherabad, where tens of thousands of devotees gather every January 31 to commemorate the day Meher Baba left his physical body. Meherabad is also the site of a free school, medical clinic, hospital, and other institutions established at Meher Baba's directive to serve those in need. The other place of pilgrimage is Meher Spiritual Center in Myrtle Beach, South Carolina, where Meher Baba stayed during his three visits to the United States in the 1950s. This center is now a place of spiritual renewal and retreat for thousands of people each year.

BIBLIOGRAPHY

Works by Meher Baba

The most comprehensive book containing Meher Baba's guidance concerning spiritual life is *Discourses* (Myrtle Beach, S.C., 1987). For a detailed explanation of his cosmology, see *God Speaks: The Theme of Creation and Its Purpose*, 2d ed. (New York, 1973). Both of these books were dictated by Meher Baba on an alphabet board. Many later discourses given through hand gestures are collected in *The Everything and the Nothing* (Myrtle Beach, S.C., 1989).

Works about Meher Baba

The most reliable biography is C. B. Purdom's *The God-Man* (Myrtle Beach, S.C., 1971), which also contains an interpretation of Meher Baba's life and message. For an extensive account of Meher Baba's work with the God-intoxicated, advanced aspirants, *sādhus*, and poor, consult William Donkin's *The Wayfarers* (San Francisco, 1969). An intimate look at life with Meher Baba is in Kitty L. Davy's *Love Alone Prevails: A Story of Life with Meher Baba* (Myrtle Beach, S.C., 1981).

CHARLES C. HAYNES (1987 AND 2005)

ME'IR (second century CE), Palestinian tanna. According to legend, Me'ir was descended from a family of proselytes that traced its line back to the Roman emperor Nero. He allegedly studied with both 'Aqiva' ben Yosef and Yishma'e'l. Me'ir was one of the five rabbis secretly ordained by Yehudah ben Bava' during the Hadrianic persecutions that followed the collapse of the Bar Kokhba Revolt (c. 132–135 CE), and he was one of the seven disciples of 'Aqiva' who issued a famous edict concerning the intercalation of the year that was crucial to the maintenance of the Jewish festivals.

Me'ir is associated with Elisha' ben Avuyah, a heretic also known as Aher, "the Other." Some rabbinic sources depict Me'ir as a sometime student of Elisha' (B.T., *Hag.* 15a).

The tomb of the legendary Me'ir Ba'al ha-Nes in Tiberias, a famous place of pilgrimage, is identified in some accounts as the burial place of Me'ir. Other Talmudic traditions suggest that Me'ir died in self-imposed exile in Asia Minor, where, at his request, he was buried beside the sea so that he could be near the waters that wash up on the shores of the Land of Israel (J.T., *Kil.* 9.4, 32c).

Me'ir is prominently linked to the major rabbinic legislative and political activities of his generation. He served as the *hakham* ("sage") of the revived Sanhedrin that met at Usha in the Galilee. His ability to defend both sides of opposing legal viewpoints was greatly extolled. Ultimately, his opposition to the authority of the *nasi*' Shim'on ben Gamli'el was the basis for his exile from Israel.

Legal rulings ascribed to Me'ir make up an important part of the earliest rabbinic compilations, the Mishnah and the Tosefta. The Talmud states that all anonymous rulings in the Mishnah are to be attributed to Me'ir. Epstein (1957) believes that the corpus of his teachings was one of the primary documents used in the redaction of the Mishnah. Since the laws in the Mishnah form the basis for much of Talmudic and later rabbinic thought and practice, it is fair to say that Me'ir is one of the most influential classical rabbinic figures.

Me'ir's dicta deal with most of the central values of rabbinic Judaism; he placed extreme emphasis on the study of Torah and strongly castigated the unlettered. One tradition attributed to him indicates his understanding of rabbinic ritual as a coherent system of practice that demanded punctili-

ous observance: "Rabbi Me'ir used to say, 'There is no man in Israel who does not perform one hundred commandments each day [and recite over them one hundred blessings]. . . . And there is no man in Israel who is not surrounded by [reminders of the] commandments: [Every person wears] phylacteries on his head, phylacteries on his arm, has a *mezuzah* on his doorpost and four fringes on his garment around him'" (Tosefta, *Ber.* 6.24–25). Many Midrashic teachings and several fables are also attributed to Me'ir.

BIBLIOGRAPHY

No systematic critical analysis has been made of the rich and extensive corpus of traditions associated with Me'ir. Two biographical treatments of Me'ir are Adolf Blumenthal's *Rabbi Meir: Leben und Wirken eines jüdischen Weisen* (Frankfurt, 1888), which is a classical treatment of rabbinic biography, and Naomi G. Cohen's "Rabbi Meir: A Descendant of Anatolian Proselytes," *Journal of Jewish Studies* 23 (Spring 1972): 51–59, which critically examines the sources pertaining to Me'ir's lineage. Jacob N. Epstein in his *Prolegomena ad Litteras Tannaiticas* (Jerusalem, 1957) discusses, in Hebrew, the role of Me'ir's materials in the formation of the Mishnah. Robert Goldenberg's analysis in *The Sabbath-Law of Rabbi Meir* (Missoula, Mont., 1978) is confined to the examination of Me'ir's contribution to the laws of a single tractate. *Rabbi Meir: Collected Sayings* (Jerusalem, 1967) is a compendium, in Hebrew, of all the references to Me'ir in rabbinic literature, edited by Israel Konovitz. Avigdor Shinan in his "The Brother of Rabbi Meir," *Jerusalem Studies in Hebrew Literature* 2 (1983): 7–20, analyzes a Midrashic story about Me'ir.

TZVEE ZAHAVY (1987)
Revised Bibliography

ME'IR BEN BARUKH OF ROTHENBURG

(c. 1220–1293), known by the acronym MaHaRaM (Morenu ha-Rav Me'ir ["our teacher, Rabbi Me'ir"]); German Talmudist, authority on rabbinic law, and communal leader. Me'ir's early years were spent studying under Yitshaq ben Mosheh of Vienna and Yehi'el of Paris; he witnessed the famous Paris disputation of 1240 and saw the Talmud burned publicly in 1242. Eventually he settled in Rothenburg and with the passing years was universally recognized by contemporaries as the greatest of Ashkenazic rabbis. With the increasingly precarious situation of German Jewry in the latter decades of the thirteenth century, culminating in Rudolph I's imposition of the status of *servi camerae* ("servants of the chamber") on all Jews and, in 1286, his confiscation of the properties of Jews who left his domain, many fled. Me'ir himself was apprehended in Lombardy in an attempt

to flee Germany and was imprisoned—possibly because of his role as a leader of the mass exodus. He remained in prison for the rest of his life, mostly in Ensisheim Castle in Alsace. Communal efforts to ransom the master never succeeded and, indeed, it was not until 1307 that his body was released for burial in exchange for a huge sum. In the sixteenth century Shelomoh Luria cited a tradition that Me'ir himself forbade payment of the exorbitant price, and Irving Agus has further claimed that the crux of the matter was its nature—was it to be ransom or tax? In these interpretations, Me'ir becomes a martyr for Jewish law and the integrity of the community. Sources contemporary with events more soberly indicate that Me'ir died in the course of protracted negotiations for his release.

Me'ir's preeminence is indicated by the express statements of his contemporaries, the scope and quantity of his *responsa*, and his impact on subsequent halakhic history. Though it is unlikely that Me'ir was ever officially appointed chief rabbi of Germany, he undoubtedly fulfilled that function. Close to one thousand of his *responsa* have been preserved, a number far exceeding the combined mass of all other tosafist *responsa*. On the whole, Me'ir avoids prolix discussions, combining care and decisiveness in his writing. Acknowledging fully the authority of the Talmud, he maintains an independent stance in relation to his contemporaries, even when their rabbinical posture is allied with communal and economic power. About one hundred of his *responsa* deal with community governance and organization. These texts are of great significance; they provide invaluable data on the social history of the period and offer substantial insight into Me'ir's political ideology. In general, Me'ir walks a thin line between the protection of individual rights and the need to give the community the legal weapons necessary for its survival and well-being.

In addition to his *responsa*, Me'ir wrote and edited *tosafot* ("additions") to many tractates of the Talmud; during his latter years in prison he was allowed access to some books and could be visited by students. His habits were noted and recorded by his students, who became the rabbinic leaders of the next generation. Me'ir's magisterial figure is prominent in subsequent Ashkenazic rabbinic development, and many of the decisions and customs recorded in Mosheh Isserles's glosses to the *Shulhan 'arukh*, authoritative for Ashkenazic Jews, derive from his work.

BIBLIOGRAPHY

Irving A. Agus's stimulating *Rabbi Meir of Rothenburg*, 2 vols. (Philadelphia, 1947), is the most detailed analysis of Me'ir's life and achievement; Agus also provides translations of a large number of Me'ir's *responsa*. A more sober treatment is E. E. Urbach's *Ba'alei ha-tosafot*, vol. 2, 4th ed. (Jerusalem, 1980), pp. 521–570. Salo W. Baron's *A Social and Religious*

History of the Jews, vol. 9, 2d ed. (New York, 1965), pp. 135–193, gives historical background.

GERALD J. BLIDSTEIN (1987)

MEISTER ECKHART SEE ECKHART, JOHANNES

MELANCHTHON, PHILIPP (1497–1560), born Philipp Schwartzerd; German theologian and major sixteenth-century reformer, writer of Protestantism's first systematic theology, organizer of the Protestant public school system, and author of two statements of Lutheran belief: the Augsburg Confession and its apology. Although he was a close friend of Martin Luther for twenty-eight years, his humanism and stance on nonessentials brought charges of corrupting Lutheranism.

Born in Bretten, Germany, and orphaned at ten, Melanchthon received tutoring from his grandfather John Reuter and the linguist John Unger. He attended the Pforzheim Latin School where his granduncle John Reuchlin, the Hebraic scholar and humanist, supervised him for two years. For achievement in Latin and Greek, Reuchlin named his nephew Melanchthon—Greek for Schwartzerd, meaning "black earth." He entered Heidelberg University in 1509, at the age of twelve, and was awarded the B.A. in 1511 but was rejected as too young to pursue the M.A. At Tübingen University he received the M.A. in 1514, edited for Thomas Anshelm's press, and published translations of Plutarch, Pythagoras, and Lycidas, comedies of Terence in verse, and his popular *Rudiments of the Greek Language* (1518). Called in 1518 to teach Greek at Wittenberg University, Melanchthon became Luther's lifelong colleague. While teaching, he studied theology and earned a bachelor's degree in 1519, his only theological degree. Thenceforth, Melanchthon taught classics and theology. In 1530 he married Katherine Krapp, who bore him four children.

In 1521 Melanchthon's *Loci communes rerum theologicarum* appeared, Protestantism's first systematic theology, which was highly lauded by Luther. It dealt with basic Reformation tenets on sin, law, and grace, and went through many enlarged editions. Besides maintaining an extensive correspondence, Melanchthon produced classical treatises, translations, commentaries, theological works, and numerous textbooks. He was called Germany's preceptor for reorganizing numerous schools and universities. The Augsburg Confession (1530), Lutheranism's basic statement of faith, was conciliatory toward Roman Catholicism without sacrificing evangelical views; the *Apology for the Augsburg Confession* (1531) was boldly assertive. Melanchthon encountered criticism when in the *Variata* of 1540 he changed the Augsburg Confession to allow a Calvinistic interpretation of the Eucharist. His ecumenical efforts brought temporary unity be-

tween Martin Bucer and Luther in 1536 on the real eucharistic presence of Christ. However, his irenic agreement with Cardinal Contarini on justification was rejected by Luther and the papacy. Fearful of antinomianism, Melancthon, with Luther's support, insisted that good works follow faith, but this view seemed too Roman Catholic for some critics. Melancthon's contention that the Word, the Holy Spirit, and the consenting human will have a part in conversion evoked charges of synergism—cooperation between God and man. Melancthon was accused by many of being too humanistic, though not by Luther.

Following Luther's death in 1546 and the Lutheran military defeat at Mühlberg in 1547, Melancthon accepted some Catholic views as nonessentials, or *adiaphora*, in the Augsburg-Leipzig Interim of 1548–1549, in order to avoid civil war and the destruction of Wittenberg. Although Melancthon boldly rejected the Augsburg Interim as too contrary to Protestant views, he later reluctantly accepted the Leipzig Interim after securing justification by faith, clerical marriage, and confession without enumeration of all sins, though scriptural authority was left vague. Other provisions—episcopal rule, baptism as in ancient times, confirmation, extreme unction, repentance, pictures, clerical dress, and numerous Catholic ceremonies—he agreed to as nonessentials. Strict Lutherans strongly objected. The Formula of Concord later asserted that nothing during persecution should be deemed nonessential. Melancthon died in Wittenberg on April 19, 1560.

AN OVERVIEW
MYTHIC THEMES

MELANESIAN RELIGIONS: AN OVERVIEW

Anthropologists have disagreed about the exact geographical boundaries of Melanesia, some using the term to designate

only the islands east of New Guinea, though without arguing that New Guinea is culturally distinct. Others have suggested that Fiji, because of its links with Tonga, should be considered part of Polynesia. Here, following the most common usage, Melanesia will be understood to extend from New Guinea in the west to Fiji in the east, encompassing the islands of the Torres Straits, the Bismarck archipelago, the Solomons, Vanuatu (formerly the New Hebrides), New Caledonia, and many smaller islands.

Within the northeastern part of this region, a few islands are inhabited by people whose languages and cultures are classified as Polynesian, such as the inhabitants of Tikopia and Bellona. Although these peoples' homes now belong to the same political units as the Melanesian islands, scholars consider them part of Polynesia. Nevertheless, it is difficult to draw a line between the cultures of Melanesia and of Polynesia to the east, Indonesia to the west, and Micronesia to the north, and many continuities exist with these neighboring regions. Furthermore, given its small total land area, Melanesia contains a much larger number of distinct languages and cultures than any other part of the world. This diversity greatly hampers generalization about Melanesia; it is only possible to mention features that recur with some regularity, while acknowledging that a single culture might fail to exhibit any of them.

As has happened elsewhere, an additional complication was introduced by foreign missionaries bringing their own religions and seeking to replace the indigenous ones. The westernmost portion of the island of New Guinea was somewhat influenced by Islam, coming via Indonesia, but in the rest of Melanesia various Christian denominations have greatly altered most traditional religious practices and beliefs. These were further affected by encounters with other foreigners, whose very existence and whose technology changed traditional worldviews; colonial governments also forbade a range of practices, such as ways of dealing with corpses, that often were closely tied to religion. Both missionaries and government officers arrived in some parts of coastal Melanesia in the nineteenth century, but did not enter the Highlands (mountainous interior) of New Guinea until the 1930s. Fifty years later there are still a few parts of this island not yet exposed to missionary influence. Inevitably, our ideas about Melanesian religion derive mainly from a small sample of societies that were either contacted late or that, unlike most, resisted conversion to Christianity. Most of these are found in the interior of New Guinea and of some large islands in the Solomons and Vanuatu, but the group includes a few small islands, such as Manus (Great Admiralty Island) and Wogeo, both north of New Guinea, whose societies were described by anthropologists before the missionaries arrived.

As regards the rest of Melanesia, because conversion has often been recent and not so thorough as to eradicate all traditional beliefs, it is still possible in most cases to learn much about certain aspects of indigenous religion. Theories about the magical causes of disease, sexual attraction, and bad

weather often persist long after orthodox Christian ideas about the destiny of the soul have been accepted. Rarely, however, is any religious belief or practice of Melaneseans living in the twenty-first century precisely like that of their ancestors. The accelerated spread of ideas from other societies as the result of pacification and wage labor, the introduction of modern technology, new conditions such as foreign diseases, and an altered worldview produce changes even in such practices as garden magic and birth ritual. In the vast majority of cases, contemporary Melanesian religions are highly syncretic, and only in a handful of scattered societies is it possible to appreciate the full complexity and emotional impact of the original systems. Given the persistence of many ideas, however, it is still possible to use the present tense to describe selected aspects of the religions, as will be done here.

THE SPIRIT WORLD. One of the few valid generalizations about Melanesian religions is that they all include a belief in a variety of spirits, some of human origin and some not, who interact with living human beings.

Souls. All people are assumed to have a spiritual component or soul (and sometimes more than one). Depending on the culture, it may derive from the descent group of one parent, in which case the child is usually born with it, or it may be inserted into the child by another supernatural being, often well after birth. Belief in reincarnation is found only sporadically. In line with a widespread Melanesian tendency not to speculate about origins, many societies have no theory about the source of the human soul. It is usually thought to be only lightly attached to the body, and to wander in dreams; often it is considered dangerous to awaken a sleeper suddenly, lest he suffer soul loss that can lead to madness or death. The souls of babies are particularly vulnerable to attack or capture by other spirits, whereas the souls of adults are more likely to be captured by human sorcerers performing magic over personal belongings, such as food crumbs, that are thought to contain part of the victim's soul-stuff. Specialist curers may undertake soul rescue in dreams, or sometimes a suspected sorcerer can be persuaded to perform counter-magic that releases the soul-stuff.

Ghosts. At death the human soul is transformed into a ghost that usually retains its identity but not necessarily its antemortem personality. In some societies ghosts are expected to be malevolent, resentful of the living, and likely to attack or kill them; in others, they are thought generally to be benevolent, especially toward their close kin; and in others it is assumed that their new condition makes them capricious or unpredictable. Sometimes the ghosts of those who die in particular ways, as in battle or childbirth, are feared even when other ghosts are considered benevolent; so may be the ghosts of former sorcerers.

There is usually a traditional abode of the dead, or a series of abodes, often a different one for each clan. Occasionally these are underground or in the sky, but usually they are on the earth and physically close to human habitations. Although it may be difficult for the ghost to reach the land of

the dead, especially if the correct funeral rites have not been performed, very rarely is there any idea of punishment after death for those who have misbehaved in life. The land of the dead is usually much like that of the living, though perhaps somewhat more pleasant; in most societies all of the dead share the same sort of afterlife, gardening, marrying, and behaving much like the living. Ghosts of the newly deceased are thought most likely to stay around their old villages for some time before really severing ties with their kin, but often people have contradictory ideas about the behavior of ghosts, simultaneously believing that they proceed immediately to the land of the dead and that they continue to haunt the village and its environs. In Manus the skull of a particular dead kinsman, in which his ghost resided, would be kept to serve as guardian for each adult man but was banished into a sort of limbo when it failed to confer benefits or when its "ward" died. In many other societies men summon the ghosts of dead kin to help with specific enterprises such as hunting or weather control; they may be aided in this endeavor by keeping some relic of the corpse such as fingernails, but the Manus practice of harboring ghosts within the dwelling house seems to be shared only with the people of Sarera Bay in Irian Jaya. Much more often ghosts are thought to reside either in bones or in special paraphernalia kept in men's houses or cult houses, far from the women and children. In a few societies, however, ghosts are summoned to join the living on special occasions, as at the famous harvest festival of the Trobriand Islands.

Spirits of the dead always have abilities both to aid and to harm that transcend those of living human beings; but they may be thought to take little interest in those left behind, who in turn are primarily concerned to avoid meeting ghosts. As those who remember them die, the names of specific ghosts are forgotten, and conceptually they may be assimilated to spirits of the bush or sea that were never human. In some societies, however, the long deceased are more important and influential than the recently dead, especially if they were the founding ancestors of large descent groups such as clans. Judging from myths, such founding ancestors may have had supernatural attributes even when alive, but in other cases they have been raised near to the status of deities by the period of time that separates them from the living or by the ceremonies carried out on their behalf. Where ancestors are accorded great powers and are regularly appealed to, it is possible to talk of ancestor cults or ancestor worship. The beliefs that ancestors are greatly concerned with the health, fertility, and morality of their descendants and that they can be induced by ritual means such as sacrifice (usually of domestic or wild animals) to grant benefits to the living are found much less often in Melanesia than in surrounding areas, but these beliefs form a prominent part of the religion in many parts of eastern Melanesia and also in the Highlands of New Guinea.

Masalai. Spirits that have never been human play some part in all Melanesian religions, but their nature and impor-

tance vary greatly from one society to another. In western Melanesia, including New Guinea and the nearby islands, one of the most important is a type known in Pidgin English as *masalai*. *Masalai* live in wild places and, although they may assume human form, are typically animals of abnormal appearance—gigantic, brightly colored, sometimes wearing human ornaments such as earrings. Often they are associated with descent groups whose members they aid in distress—if, for instance, they are lost in the bush or drowning—but they do so only if the person has observed relevant rules concerning marriage and food taboos. Offenders may be punished by the *masalai*, who also attack outsiders who stray into their territory. Monstrous births may be attributed to the child's having been conceived in a *masalai* place (and possibly actually being its child); getting lost in the bush can result from being led astray by them; and sudden illness after eating wild animals or plants may be ascribed to either having ingested the *masalai* itself, in one of its transformations, or having “stolen” a food that actually belonged to the *masalai*. (The spirit may later visit the victim in a dream to explain its action.) Melanesia has few dangerous wild animals, but the uninhabited bush and the deep sea teem with dangerous spirits, and many people are uneasy about moving far outside the area of human settlement and cultivation. In some societies, men—as hunters, fishermen, traders, and warriors—think of the bush as peculiarly their own, free of the threat of sexual contamination by women, while in others women are banished from the village when they are in a dangerous condition (e.g., menstruation and childbirth). Usually the village is regarded as uniquely safe from supernatural threat, at least during the day; after dark, spirits more easily invade the human domain. Belief in menacing beings that assume a harmless form at daybreak is widespread in Melanesia.

Deities and culture heroes. Many spirit beings appear only in mythology and play no part in contemporary society apart from being remembered when origins and migrations are discussed. Some societies even lack such mythological figures. In a relatively small number of Melanesian cultures, however, people believe in uniquely powerful spirits who maintain an interest in the whole society rather than in specific descent groups. They are sometimes referred to in the scholarly literature as “deities,” especially if they seem well disposed toward humankind; otherwise they may be called “demons” by outside observers. The large majority of Melanesian religions cannot be described as ethical; spiritual beings and forces rarely support the rules of society except in very limited spheres. Exceptions exist, especially in the east (where influence from Polynesia may be involved in some cases) but also in the New Guinea Highlands. In these societies, deities may punish misbehavior with crop failure, human infertility, sickness in the pig herds, or volcanic eruption. If procedures exist for ascertaining the will of the deity, it may be possible to placate him or her, usually with offerings. Otherwise people simply try to avoid or prevent behavior likely to evoke the wrath of the gods, and sometimes ex-

plain that they must do everything just as they were told to in the remote past lest disaster befall them.

Interestingly, several Melanesian societies in which the status of women is low have male cults devoted to the worship of female goddesses who promote male interests alone. Much more common are deities who are concerned with only one activity or one aspect of life, such as fishing for bonito, or warfare. Less powerful spirits may be invoked to aid with other activities such as gardening.

Whether or not deities remain near, or accessible to, human settlements after performing initial acts of creation, they may be mentioned in magical spells as a sign that the magic too derives from them. In a number of societies along the north coast of New Guinea, it is reported that meticulous maintenance and performance of ritual secrets imparted by these deities and culture heroes ensures success in a wide range of activities. Other societies are not so conservative, and their members try out any new rituals that seem promising. To the extent that deviations from morality are punished in these, the actual penalties are usually carried out by men wearing masks and manipulating ritual noisemakers such as flutes and bull-roarers to represent the voice of the spirits. The men may not believe that the spirits are present, but women and children are said to be deluded.

In a few areas there exist religious cults that are dedicated to a particular deity or other powerful being, or to the semideified collection of ancestors. In historical times such cults, typically involving secret rituals held in special structures, have spread widely in the New Guinea Highlands, honoring beings who promote health, strength, and fertility. Elsewhere, cults center on dispelling disease and other ills, so that cult performances tend to be triggered by disasters. Whatever their nature, cults, like most major religious activities in Melanesia, tend to involve only mature males.

RELIGIOUS SPECIALISTS. Officials who intervene between deities and ancestors and the ordinary people have often been called priests, even though they are never full-time specialists. Throughout Melanesia the most esteemed religious expert is a man of mature age who possesses detailed knowledge of ritual, either through training by another expert or by attaining the higher grades of a secret society. Where he is expected to communicate with the ancestors, he is ideally their senior male descendant, but ability to learn and perform rituals may outweigh pure seniority. By contrast with some other parts of the world, ritual specialists are rarely set apart psychologically or sexually, although they may report many direct encounters with spirits in dreams or, while purportedly fully conscious, in waking life. They are taught what they know rather than being inspired. In a number of Melanesian societies mediums are possessed by spirits, like the Manus women who communicate with ghosts through their own deceased young sons, and the curing shamans of the Baktaman of New Guinea, who must be possessed by a particular spirit before assuming their roles. Such people are rarely the most esteemed experts; the mediums of the Kaluli of New Guinea

described by Edward L. Schieffelin (1976) are exceptional in this respect.

That for most of Melanesia religious experts have been described as magicians rather than as priests or shamans reflects the most widely reported attitude toward the supernatural. Power lies in the hands of human adepts rather than with gods or other spirits. Given sufficient knowledge, men can control rain, sun, and wind; they can bring success to themselves and their kin and misfortune to others—making gardens flourish or blighting them, luring a pig into a trap or a rival's garden, sending a snake or crocodile to kill an enemy or causing him to fall from a tree, or enticing a woman from her husband. In some societies they accomplish their ends by manipulation of spirit beings, while in others the results follow automatically if ritual is performed correctly. Particularly as regards eastern Melanesia, much has been written about the concept of an invisible supernatural power, called *mana* (or some cognate term), which can be manipulated by the magician. As originally described by R. H. Codrington in *The Melanesians* (1891), *mana* was thought to be a power derived from "spiritual beings," but the term came to be understood by some other anthropologists as designating power that is impersonal and independent of spirits. Certainly the term exists in both eastern Melanesia and Polynesia, but there have been many debates about its exact significance, as Roger M. Keesing points out in *Kwaio Religion* (1982).

It is generally agreed that even when terms like *mana* are used, the speakers tend to have no clearly defined and expressed concept of just what this supernatural power is and how it operates. What interests them are results that can be duplicated. If an act seems to be effective, it does not matter just how the effect is produced. Typically, Melanesian magic involves the recitation of spells that must be carefully memorized; the use of substances thought to be potent in themselves, such as ginger; ritual acts that may involve imitation of the results desired; and maintenance of a state of potency by the observation of taboos, as on washing and sexual intercourse. Failure to achieve the desired results is usually attributed to countermagic performed by someone else, but it may also be blamed on failure to learn or perform correctly. All magic is not this complicated; sometimes only the spell or the act is needed. With the simpler forms, it may be difficult to distinguish magic from technology, and often distinctions are made by an outsider that would seem artificial to the local people. Trying to make a woman conceive by simply putting spider eggs into her food is an example of such a borderline case.

In Melanesia, intent is always involved in magic; there is no equivalent of the African witch or European possessor of the evil eye who harms others involuntarily. In most cases, too, evaluation of the act depends on the relation between the performer and those affected. In a few societies, such as that of the Tangu on the northern coast of New Guinea, there exists a belief in wholly malicious sorcerers all of whose

attacks are condemned, but in many other societies a sorcerer is admired so long as he does not attack members of his own group. Usually all men know a little magic—for gardening, hunting, fishing, and sexual attraction—but only a few specialists know the major types such as those dealing with weather control, warfare, sorcery, and the curing of serious diseases. In most Melanesian societies all deaths except those of the very young and the very old tend to be attributed to supernatural causes—sorcery, spirits, or the breach of a taboo—and so do all major accidents and serious illnesses. Diviners and curers seek to ascertain the cause of sickness or death, to help cure the sickness (possibly by identifying the person responsible), and to direct vengeance in the case of death. Magicians are often paid fees when they perform outside their kinship group, unless their work benefits themselves along with others, as is the case with garden magicians. Usually each community contains a number of different specialist magicians, but political leaders are likely to control more than one major form of ritual, either through their own knowledge or by being wealthy enough to hire others. Political leadership is reinforced by religious knowledge, but only in a few coastal societies are there official magicians at the service of the leaders.

TABOOS AND TOTEMS. The English word *taboo* is derived from a Polynesian word (Tongan, *tabu*), and its cognates appear in many of those Melanesian languages that are related to Polynesian languages. Similar concepts, called by different terms, are found among speakers of unrelated languages. There is debate about the range of meaning of these terms, but they normally include the concept of "forbidden," and often "sacred" as well. The words meaning "taboo" may be nouns, adjectives, or active verbs. The source of taboos varies from one society to another, and so does the kind of thing encompassed by them. Sometimes they can be traced to edicts by deities in mythological times, as is usually the case with incest taboos. So too can special attitudes toward totemic animals or plants. These are species associated with particular descent groups, perhaps because people are thought to be descended from similar but supernatural beings; perhaps because they emerged from the underworld together with these species, as is believed in the Trobriand Islands; or perhaps because of aid given by a member of the species to a human ancestor. Whatever the reason for the connection, members of the descent group are usually forbidden to kill or eat members of their totemic species; if they break the taboo, they may sicken or die. Those who punish such breaches of taboo may be the creatures themselves, their ghosts (which may be possessed by animals and plants as well as people), the ghostly founders of the descent groups, or some impersonal force that acts automatically. All associations between people and natural species are not totemic; sometimes members of a particular descent group simply claim to have first discovered a food plant, or to have particular success in hunting certain animals. Where totems do occur, however, they are a significant part of the religion, but in a different category from spirits.

Many other taboos are tied in with aspects of the local worldview. For example, if the soul is called by the same term as the reflection and shadow, as is often the case, it may be taboo to stare at one's own reflection or to step on someone's shadow, for fear of soul loss. Traditional systems of belief typically involve the observation of many taboos, some of which result from revelation by spirits and some from simple deduction. An unexpected event such as an earthquake may be ascribed to the breach of a previously unknown taboo, the nature of which may be revealed by a supernatural being in a dream. Equally often, however, it is simply decided that any action out of the ordinary that immediately preceded the event actually caused it, especially if the action took place in the wild. To avoid further trouble, it may be decided and announced, for instance, that never again should anyone put a stick down a rat hole. Since taboos acquired in this way rarely form a coherent system, they can seem arbitrary and almost meaningless once their origin has been forgotten, but it may be strongly believed that the maintenance of society and of human life depends on meticulous observation of them.

WOMEN AND RELIGION. Melanesia is famous in the anthropological literature for what has been called sexual antagonism, most often expressed in male fears of contact, which can be dangerous and weakening, with women. At their mildest, such fears and avoidance are no greater than those found in many societies outside Melanesia. Men's reluctance to sleep with menstruating women, and their belief that sexual intercourse saps the strength of a warrior and is antithetical to the practice of religion, can be found almost everywhere. More characteristically Melanesian is the frequently encountered belief that fertile women in themselves are polluting to men, particularly, but not exclusively, when menstruating and during and immediately after childbirth. While menstruating, they may be forbidden to cook for men or to enter gardens, and in many societies have to retire to menstrual huts in the bush. If menstrual blood is feared, so too is the blood shed in childbirth. Not only does a man avoid the scene of childbirth, which also may be relegated to the bush, but he may consider both mother and baby to be polluted for months after the birth. It may be considered dangerous for a man to touch a young baby, surrounded as it is by the dangerous aura acquired from its mother. Later little boys may need to be ritually cleansed of female influences before they will be able to become mature men or to participate in male ceremonies. Where fears of female pollution are high, men usually spend much of their time in men's houses separate from the family dwellings. Such structures may be taboo to women and even to little boys, who will have to undergo special rituals before they can begin to sleep there. In a number of Melanesian societies, fertile women are thought to pollute anything that they step over, such as food, firewood, or human beings. Men must take care never to be physically below women, nor to drink downstream from where women bathe. In extreme cases, as among the Kwaio of Malaita in the Solomons, the whole village is built on ridges so that ev-

erything pertaining to men, including ancestral shrines, is uphill from the area assigned to women.

The situation is not always so simple as it seems at first glance. In some societies, such as Wogeo, women too are thought to be endangered by the sexual secretions of men, and menstrual blood may also be considered polluting to a woman (who then has to take great care while eating or chewing betel nut during menstruation) as well as to a man. Furthermore, it has been argued that women actually enjoy and profit from the periods of seclusion associated with menstruation and childbirth, rather than feeling that they are suffering because they are unclean. Certainly women's labors may be lightened if it is thought that crops planted by them will not grow well and that men will sicken if they eat food cooked by women. Furthermore, the possibility that an angry wife might put menstrual blood into the food of a husband who beats her, and so "poison" him, gives her some control over his behavior. If, however, women are thought to be innately malevolent, or to become malevolent because they are subject to discrimination in such matters as diet, their ability to harm men may count against them in that they are likely to be accused of causing deaths, and to be killed in revenge.

In most of Melanesia, however, the low status accorded women also keeps them from being considered powerful magicians. An exception is the so-called Massim region off the eastern tip of New Guinea (including the Trobriand Islands), where female status is relatively high, and where cannibalistic female witches who fly abroad seeking victims are blamed for many deaths. In most other parts of Melanesia, those deaths not attributed to spirits are more likely to be blamed on male sorcerers. If women know magic at all, it typically deals with female fertility and childbirth, and with the growth and health of small children. Nevertheless, women may play a role in religious life insofar as their dreams may be taken as seriously as those of men, so that they too may have meaningful encounters with spirits and can act as soul rescuers, as well as sources of information about the world of spirits. The most respected female adepts are likely to be women past menopause, who are exempt from many of the restrictions of their juniors, and who may even be identified with men.

Where women are considered unfit for the most esteemed activities, the reason may simply be that they are thought to be physically and mentally weaker than men. Often, however, it is held that femininity in itself, or because of its association with female blood and milk, is repulsive to spirits and to wild animals, who flee hunting and fishing equipment if women touch it. Sometimes it is the odor of sexual intercourse rather than of women specifically that is thought to repel other beings; nevertheless, even in those societies that do not practice the sorts of discrimination just described, women are usually forbidden to touch certain male tools and weapons, and warriors must avoid too much contact with women or risk death in battle. Usually these ef-

fects are automatic. If women are really feared and avoided in other contexts, boys are likely to need formal rites of separation from their mothers before they can join the men in their exclusive domain.

rites of passage. Whether changes of status during life are marked ritually depends on the society and on the individual's position within it. If there is a class system, as in many coastal areas, members of the upper class receive much more ceremonial attention than do ordinary people. Elsewhere ritual may be focused on the firstborn child, regardless of sex, in the belief that some benefits will extend to younger siblings. Often ceremonies mark the first time that the child engages in any new activity, such as going to the gardens or having his first haircut. Although rites of passage always mark a change of status, they need not contain a religious element. Ceremonies revolving around children or grandchildren are often sponsored by older men to enhance their own prestige, and the complexity and amount of display has little to do with the significance of the event except as a marker of wealth and social status. Of all the rites of passage commonly held in Melanesia, weddings are least likely to be religious ceremonies, whereas funerals almost invariably are.

Birth. A first pregnancy, and the birth of a first child, may be celebrated for the mother as marking her final shift of responsibility from her parents to her new status as a parent herself. Unless she experiences difficulties in childbirth, religious rituals are not usually involved except for the observation of many taboos on acts that might affect her or her child. The husband may need to observe these as well. After birth, however, the baby is vulnerable to many inimical forces, and is normally kept in seclusion until his survival seems likely, when his skin has darkened and the umbilical cord has dropped off. He may then be given a name and formally introduced to the community. Both parents continue to observe taboos on behavior that might affect him, staying away from spirit places and wild foods that might be associated with spirits. Spells are recited to promote his health and growth, and rituals may be performed in connection with such events as the appearance of teeth. Among the Siuai of Bougainville, the young child is the object of an elaborate ritual that summons spirits to help him, after which he is a full member of society; usually, though, the most complex rites are reserved for puberty.

Puberty and initiation. In many parts of Melanesia it is taken for granted that once the perils of early childhood are past, a child will mature naturally; supernatural aid is invoked only for illness. In others, boys especially are thought to need the aid of both society and the supernatural if they are to reach healthy adulthood. Puberty rites for boys are likely to be communal events occupying long periods of time. A girl very often undergoes a ceremony at menarche that may involve a period of seclusion, both because of attitudes about menstrual blood and because her emergence afterward is likely to mark her transition to the new status of marriageability. Sometimes elaborate rituals surround the whole period of isolation.

In a very few societies, such as the Orokaiva of New Guinea, boys and girls go through puberty ceremonies together. But much more often boys are separated from all females. In many parts of New Guinea they are subjected to rituals involving vomiting and bloodletting designed to rid their bodies of the pernicious effects of their former contact with women. In some societies, such as the Wogeo, male bloodletting is equated with female menstruation: designed to rid the body of "bad" blood, it is practiced throughout life. By contrast, in a group of societies in south central New Guinea, it is held that boys will mature only if they are "fed" with semen, and highly secret ceremonies involving ritual homosexuality form the center of the puberty rites. Where much secret knowledge is imparted at this time, puberty rites are indistinguishable from initiation into men's societies or cults; but usually the religious content of the rites is limited to the use of spells and practices to promote health, growth, and beauty. Various taboos are connected not only with separation from women but with the healing of any operations on the penis, nose, ears, or skin that also signal the change of status. At the end of the rituals, the boys emerge fully decorated in a new social persona, but may still avoid marriage for some years.

Men's societies forbidden to women extend from New Guinea to Vanuatu; only in this last island group are women reported to have similar societies of their own. Often the male societies are basically political rather than religious, a way for older men to dominate women and boys; but in some areas much secret knowledge of rituals essential to the maintenance of society is in the hands of the few individuals who have passed through various grades of initiation, typically with severe associated ordeals. Passing through all the grades may take a lifetime, and, in parts of Vanuatu, a fortune. Sometimes the actual secrets are minor, apart from the frequent revelation that purported spirits are simply human impersonations; the initiates may only learn how masks are made or how the "voices" of the spirits are produced. In these cases it could be argued that belief in the existence and non-human nature of these beings is part of the religion of the uninitiated but not of the initiates. A measure of deception need not, however, indicate the absence of other levels of belief among the initiates. Several recent studies of rites still being carried on in the interior of New Guinea reveal that often the older adepts really believe that they alone are able to keep society functioning; their activities are serious behind the facade of deception and frequent revelations of trivia. Overall, however, there is no necessary connection between the elaborateness of the ceremonies, the degree of hazing involved, and the care with which the secrets are guarded from noninitiates, and the actual religious content. Perhaps because of the way they spread from one society to another, rites that look very similar on the surface may differ greatly in function.

Mortuary rites. Death triggers the ceremonies most characteristic of Melanesia, particularly of the coastal and

lowland regions. Beginning with the funeral, these may culminate years later in great festivals involving dances and masked performances and the dispersing of vast amounts of pork and other food to the participants. In most societies formal funerals are held for everyone, though they may be abbreviated when the corpse is that of a baby or an old woman who lacks close kin. At the wake that enables mourners to view the body, diviners often attempt to ascertain the cause of death from the ghost, which then may be ritually dispatched to the land of the dead. Although cremation is practiced in a few places, in many others initial disposal of the body is temporary. It may be exposed on a platform or buried for a few months until decay is complete, but thereafter some or all of the bones may be subject to special treatment. This varies according to local ideas about the relations between body and soul, and about the symbolic significance of bones and of specific parts of the body such as the head.

The period following initial disposal of the body is typically one of intense mourning for the surviving kin, who abstain from work, keep a restricted diet, make themselves as physically unattractive as possible, sometimes lop off a finger joint, and often go into complete seclusion. The heaviest restrictions fall on the widow, whose willingness to submit to them may be taken as evidence that she did not help to kill her husband by magical means. Only in Dobu, a matrilineal society in the D'Entrecasteaux Islands, east of New Guinea, is mourning for the widower more arduous than for the widow. In a number of lowland societies extending as far as Fiji, the wife or wives of prominent men or chiefs were formerly killed to join them in the afterlife, and in southwest New Britain all widows were killed and buried with their husbands, whose ghosts would linger around the settlements until their wives joined them. A widow cannot resume normal life in other parts of Melanesia until she has been formally released from mourning, in ceremonies that mark her reintegration into the community.

Personal possessions of the dead may be broken, trees cut down, and pigs killed either as signs of grief or so that their spiritual essence can be released to accompany the deceased into the afterlife. It may also be considered supernaturally dangerous for survivors to remain in close contact with the personal possessions, which are imbued with soul-stuff. Much of the remaining property, especially pigs and garden crops, is likely to be used in feasts celebrating the lifting of taboos from the mourners. When this is done, relics of the dead, such as the house in which the person died, may be destroyed. But if further ceremonies are planned, some relic will be preserved for use in these.

Major mortuary ceremonies are not held for everyone. Men of high status are usually honored in this way by their kin; but equally often, a leader or a man who aspires to that status sponsors such a ceremony primarily for the personal glory that he will gain. The dead person may be any type of kin, such as a young child or a mother-in-law; their importance as individuals in life or after death may be wholly sub-

ordinate to that of the sponsor. Throughout Melanesia leaders attain or ratify their positions by sponsoring ceremonies in which they try to outdo each other in display and generosity. Some of the food dispensed at mortuary ceremonies may derive from that left by the deceased, and so be taboo to some of those who attend. Furthermore, the specific parts played by those attending may reflect their relation to the dead as well as to the sponsor, and if relics are displayed, those holding them are likely to be close kin, who weep as they remember the dead. Unless the ghost is thought to attend, however, the religious content of such ceremonies may be confined to magic designed to produce a successful occasion, as by preventing rain and ensuring that the food supply is adequate. The deceased may be present only in memory. It is, however, common for a few final mortuary taboos to be lifted on these occasions, such as those prohibiting use of the fruit trees and the house site of the deceased.

In some societies apparently similar ceremonies have the deepest religious significance. Ghosts of the dead, sometimes including those of distant ancestors, may be summoned to attend, and rites are directed at them in an attempt to win their favor and avert their wrath. When pigs are killed, their blood soaking into the ground or burnt portions of their bodies are specifically intended as offerings to the ghosts. The fate of the bones of the dead varies with the sorts of continuing relations desired between their former owners and the living, but often they are deposited in sanctuaries such as caves, or in structures that serve as temples in which the bones will be a focus for future rituals. If bones are reburied or deposited in village or garden sites, their presence may create continuing prosperity, fertility, and safety for the descendants who use the land.

ART AND RELIGION. The spectacular art of most of lowland Melanesia is usually, but not invariably, connected with religion. In some societies, such as those of the area around Lake Sentani in Irian Jaya and of the Massim Islands east of New Guinea, almost all utilitarian objects are decorated, and in most cases the decorations have no religious significance. The most dramatic Melanesian sculptures, paintings, and constructions are, however, produced either specifically for religious ceremonies or to honor and commemorate particular spirits. Some of the most colorful constructions, made of painted barkcloth or woven fiber decorated with colored leaves and feathers, may be quite ephemeral; perhaps inhabited by spirits during a ceremony, they are destroyed or dismantled with the departure of the spirits for their own realm. The sculptures and painting that represent spirits may also be kept permanently hidden inside men's houses or ceremonial structures forbidden to noninitiates; viewing of these pieces, and explanation of their meaning, often forms a major part of initiation ceremonies. Women may never see them. The manufacture of ceremonial art, including even the gathering of leaves to conceal the bodies of maskers, is usually carried out in great secrecy, with women and children threatened with death if they approach the area or voice any suspicion that the supposed spirits are actually human cre-

ations. Spirits may indeed be summoned into the art objects after they are complete, and sometimes the actual process of manufacture introduces the spirit, as when eyes are painted on the masks of the Tolai of New Britain. In many societies, however, simple impersonation is involved, but magic is usually employed to ensure that the impersonations are successful, and sorcery is used to punish those who speak disrespectfully of the ceremonies.

When carvings are made for rituals—such as those connected with puberty and death—that honor specific individuals, they often include motifs associated with that person's descent group, such as totems and *masalai*. True portrait sculpture is rare but is found in a few areas, as in memorial carvings in parts of the Solomons and most notably in the modeling of features over the dead person's skull in parts of Vanuatu, New Britain, and the Sepik River region of New Guinea. Often memorials are destroyed when the mortuary ceremonies end, and anthropomorphic sculptures that remain permanently in place usually represent more distant ancestors or deities. Such sculptures are prominently displayed in many regions, forming the doorjambes and finials of houses in New Caledonia, and standing outside men's houses and clubhouses in parts of the Solomons, Vanuatu, and Sepik River region.

The ritual art of other areas focuses not on ancestors but on supernatural beings who are only partly human in form, like the shark god of parts of the Solomons or the culture hero with the body of a snake of western New Britain. Still other beings, such as those painted on the facades of Sepik ceremonial houses or constructed elsewhere for ceremonies to bring fertility or drive away sickness, have little or no trace of humanity in their appearance. Particularly in the New Guinea Highlands, divine power may reside in objects such as stones or boards that are painted with abstract designs of uncertain meaning.

Art objects collected for museums have often been arbitrarily identified as representing gods, ancestors, or totems, without any real evidence that they were so regarded by their creators. Detailed studies of Melanesian art in its context are few, and have demonstrated in some cases that people may be uncertain about the precise significance of designs that may still be thought to form an essential part of a ritual. Some anthropologists argue that art and ritual express and communicate messages that cannot be conveyed verbally, so that it is useless to expect native exegesis. The field is then open for the outsider to proffer his own explanations, and many have taken advantage of the opportunity. Some experts, especially those trained in a German tradition of reconstructing culture history in terms of postulated waves of migration, tend to see evidence in art of the previous existence of earlier religious attitudes such as sun worship. Anthropologists have more often relied upon psychoanalytic theory or a structuralism modeled on that of Claude Lévi-Strauss to explain what is being represented at a subconscious level. The same types of interpretation have been applied to myth and ritual.

In some societies, however, the local experts are willing and able to discuss art objects and their relation to religious concepts. As with other aspects of religion, many details remain inexplicable, simply a traditional way of doing things that is not questioned. It may also, of course, be improper to discuss esoteric matters with noninitiates; but outsiders have often been admitted to discussions that are closed to female or junior members of the society itself.

SACRED AND PROFANE. In describing Melanesian societies, many observers have hesitated both to use the word *sacred* and to contrast it with the *profane*. The reasons are several. First, the discovery that often masked men impersonate supernatural beings without feeling any religious awe emphasizes the secular character of many ceremonies. Second, the widespread tendency to rely on magic in which impersonal forces are manipulated by individuals, and the rarity of communal rites dealing with supernatural beings, makes it difficult to apply labels derived from other religious systems. Third, the frequent observation that Melanesian religions tend to be highly pragmatic, concerned with securing benefits in this life rather than rewards in another world, and not concerned with problems of good and evil, has led some to deny that they are really religions at all. The fact that supernatural beings are rarely all-powerful, awesome in appearance, wholly incorporeal in nature, or far removed from human habitations, and in fact that ordinary people so often encounter them in the bush or in their dreams, makes them seem part of everyday life rather than being set apart, natural rather than supernatural.

The rituals of some societies do, however, strike some observers as embodying concepts that can be labeled sacred. Communion with ancestral spirits by priests and other specialists in Fiji, Vanuatu, the Solomons, and Highlands New Guinea; first-fruits rites in New Caledonia; the invocation of powerful nonhuman spirits along the Sepik: all these seem on emotional and cognitive grounds to indicate that the term is applicable. *Sacred* has also been applied to the state of religious practitioners while carrying out ritual, and of those who are temporarily removed from normal society during rites of passage. In these instances it is suggested that women, children, and noninitiates belong to the realm of the profane, and doubly so as regards women if they are regarded as intrinsically polluting to men and antithetical to religious enterprises. Several investigators have, however, argued that such labels and dichotomies are misleading. If men are taboo when sacrificing to the ancestors and women are taboo when menstruating, they are seen as similar rather than separate (see Keesing, 1982, p. 66). Furthermore, the fact that women usually do interact with the spirit world and control some magical techniques of their own invalidates the assumption that they are excluded from the realm of the sacred.

When *sacred* is used today, it tends to be in two contexts. Places consecrated to spirits, such as burial caves, ancestral shrines and groves, and cult houses, may be permanently sacred, as are places inhabited by important supernatural be-

ings such as *masalai*. By contrast, people may be only temporarily sacred during a religious performance; eventually they return to their normal state and to the everyday world. In this, the usual processes of life continue to involve them in contact with supernatural beings and forces, so frequently that it seems meaningless to characterize what is not sacred as profane.

BIBLIOGRAPHY

Most of the earlier descriptions of Melanesian societies written by anthropologists and missionaries contain lengthy and relatively straightforward accounts of religious beliefs and activities. On the theoretical side they may devote much time to out-of-date controversies about such matters as the nature of totemism or the possible connections between Melanesian religions and those of other parts of the world. Only a few of the better-known examples are mentioned here, but many others exist. Later investigators more often begin with varying theories about the nature of religion and ways to study it, producing works that differ greatly from each other, in which the author's role as interpreter is usually made explicit, and in which the study tends to focus on a particular problem rather than attempt to cover the entire field. Many recent books are consequently both narrower and deeper than earlier ones. The earlier works are particularly useful for an overview and for descriptions of long-vanished ceremonies, while the later works may be considerably more difficult to read but may expose the student to a wide range of theoretical problems and current controversies in the field of religion both in Melanesia and in other parts of the world where small-scale societies still exist.

Allen, Michael. *Male Cults and Secret Initiations in Melanesia*. Melbourne, 1967. An out-of-date but useful survey of the nature and distribution of these institutions, which also examines various theories attempting to account for them and settles for one in which social structure is the important variable.

Barth, Fredrik. *Ritual and Knowledge among the Baktaman of New Guinea*. New Haven, 1975. An interesting attempt to use the author's investigation of an elaborate initiation system as a basis for generalizing about the nature of ritual and the communication of knowledge in other societies.

Bateson, Gregory. *Naven* (1938). 2d ed. Stanford, Calif., 1958. A classic attempt to analyze certain rituals of a Sepik River society with approaches this writer later made famous in such fields as communications theory.

Codrington, R. H. *The Melanesians: Studies in Their Anthropology and Folklore* (1891). Reprint, New Haven, 1957. Based mostly on interviews with Melanesian mission students, supplemented by some visits to the islands of eastern Melanesia, this work is often incorrect in ethnographic detail but contains the classic discussions of *mana* and taboo, and useful descriptions of now-vanished rituals.

Deacon, A. Bernard. *Malekula*. Edited by Camilla H. Wedgwood. London, 1934. Incomplete, having been edited from field

notes after the author's death, but the most accessible account of the elaborate New Hebrides (now Vanuatu) graded societies, with much information on religions.

Fortune, Reo F. *Sorcerers of Dobu* (1932). Rev. ed. New York, 1963. Includes a general account of ritual in small islands east of New Guinea, with particular attention to the importance of sorcery beliefs and practices.

Fortune, Reo F. *Manus Religion: An Ethnological Study of the Manus Natives of the Admiralty Islands* (1935). Reprint, Lincoln, Neb., 1965. A famous account of a religious system uncommon in Melanesia for its ethical content and for the role of ancestral ghosts.

Gell, Alfred. *Metamorphosis of the Cassowaries: Umeda Society, Language, and Ritual*. London, 1975. An innovative attempt to interpret a fertility ritual in a New Guinea society by analyzing the associated language and symbols. The arguments are complex.

Herd, Gilbert H., ed. *Rituals of Manhood: Male Initiation in Papua New Guinea*. Berkeley, 1982. A collection noteworthy for the attention paid to psychological as well as social and religious aspects of initiation. Contains several detailed descriptions of ceremonies in their wider context.

Hogbin, Ian. *The Island of Menstruating Men: Religion in Wogeo, New Guinea*. Scranton, Pa., 1970. Based on fieldwork carried out in 1934, this general account, written for the non-specialist, pays particular attention to concepts of pollution and taboo, and contains some discussion of theories about magical ritual.

Keesing, Roger M. *Kwaio Religion: The Living and the Dead in a Solomon Island Society*. New York, 1982. Includes not only description of belief and rites among pagans on Malaita, but discussion of many theoretical issues concerning concepts of pollution, *mana* and taboo, symbolism and meaning, and the social consequences of religious beliefs and practices. Addressed to a general audience.

Lawrence, Peter, and M. J. Meggitt, eds. *Gods Ghosts and Men in Melanesia*. Melbourne, 1965. A series of descriptive essays, all but one dealing with the religions of Australian New Guinea (now Papua New Guinea), with an introduction in which the authors attempt to generalize about Melanesian religions as a whole. A very useful survey, though authors of the essays have not all dealt with the same topics. But it has been rendered somewhat out of date by more recent studies.

Lewis, Gilbert. *Day of Shining Red*. Cambridge, 1980. An interesting and readable critical examination of the usefulness of various theories of ritual in helping to understand the nature and meaning of puberty rites in a New Guinea village.

Malinowski, Bronislaw. *Magic, Science and Religion*. New York, 1948. Contains three famous essays setting forth Malinowski's theories about the differences between magic and religion and the functions of these practices and of mythology, as well as a description of Trobriand beliefs and rituals concerning the dead. Malinowski's theories continue to influence a number of scholars, and are clearly explained here.

Rappaport, Roy A. *Pigs for the Ancestors: Ritual in the Ecology of a New Guinea People* (1968). Rev. ed. New Haven, 1984. A well-known and widely quoted attempt to explain ritual in adaptive terms. In the revised edition, the author answers his

critics and presents the results of further thinking on such topics as the importance of sanctity (“sanctified understandings”) in human societies.

Schieffelin, Edward L. *The Sorrow of the Lonely and the Burning of the Dancers*. New York, 1976. A short and readable account and analysis of a set of ceremonies in a New Guinea society, with particular attention to their emotional content.

Tuzin, Donald. *The Voice of the Tambaran: Truth and Illusion in Ilabita Arapesh Religion*. Berkeley, 1980. A complex and detailed examination of the meaning of the numerous rituals associated with male initiation, which are characterized by spectacular religious art in a New Guinea society. Questions of belief and psychological reactions to the rituals are discussed as well.

Williams, Francis E. *Drama of Orokelo: The Social and Ceremonial Life of the Elema*. Oxford, 1940. A detailed description of one of the most elaborate and spectacular ceremonial cycles ever recorded for Melanesia, and the implications of its decline and neglect in the colonial period.

MELANESIAN RELIGIONS: MYTHIC THEMES

The myths of all known Melanesian peoples are subtly, intricately, and often tacitly bound to fundamental matters of worldview, ethos, and personhood in religious systems of meaning. Yet the study of myth in Melanesia has a long, largely unvaried tradition of being descriptively rich but analytically impoverished. Indeed, this fascinating field of study remains a vast *terra incognita* in important respects and lags significantly behind the study of Melanesian ritual, in which significant theoretical and comparative advances have been made. Relatively few ethnographies of Melanesian cultures and societies have focused exclusively or even primarily on

making theoretical or comparative sense of the marked diversity and remarkable intricacy of the mythology of this area. Most ethnographic studies contain some references to myth, but in general, myth tends to be merely a secondary feature of the central analytic endeavor and is explored—if at all—largely to enhance the primary interests of analysis. Only recently has Melanesian mythology begun to attract focal analytic attention on its own.

STUDIES OF MELANESIAN MYTH. The legacy of earlier studies of Melanesian myth still burdens present endeavors to summarize and to synthesize what is archivally available. In the late nineteenth and early twentieth centuries, scholars working among the myriad indigenous peoples of the Dutch, French, English, and German Melanesian colonies compiled extensive collections of mythic narratives in many forms. These often simplistic assemblages of myths, however, were ethnographically sterile and left ample room for varied academic fancies and fantasies to supplant Melanesian mythic realities. The collections were sometimes linguistically suspect and often unidentified by genre of oral literature and by sociocultural group. Thus, various kinds of myths, legends, folk tales, and other conventional classes of oral literature, sometimes from different regions, would often be merged in one collection regardless of local or analytic senses of genre. Compilations tended to include an emphasis on origin myths, mythic charters of institutional forms, and myths and legends of culture heroes and migrations. These early collections revealed little about other important aspects of Melanesian myth—of its role in or as a sacred performance and as an assertion of ideology or belief, a map of supernatural landscapes, a model of personhood, a mode of ethnohistorical discourse, a social or ritual charter, and a shared but also contestable collective representation (in the Durkheimian sense). They usually ignored the significance of myth as a vital, flexible, and changing but also enduring aspect of a lived, remembered, and imagined sociocultural reality among those islands of the southwest Pacific that constitute Melanesia.

The boundaries of mythology in Melanesia are sometimes obscure, for the analysis of myth as sacred narrative has been simplistic, uncritical, imprecise, and inconsistent and has not encompassed the many diverse kinds of regional oral traditions. Moreover, scant attention has been given to local genres of narrative, such as the Daribi *namu po* or *po page*, Kalauna *neineya*, Kamano *kinibera*, Keraki *ninyi-ji*, Kewa *lidi* or *ramani*, and Trobriand *kukwanebu*, *libogwo*, or *liliu*. Indeed, there are few ethnographic portraits of the classificatory complexity exhibited in the seventeen genres of Bimin-Kuskusmin oral tradition, or analytic frameworks that could accommodate such complexity. Nonetheless, the sacred qualities of myth often do seem to be marked in a more or less distinctive manner throughout Melanesia. Thus, myths may be distinguished by certain modes of discourse or language (as among Bimin-Kuskusmin, Daribi, or Kwaio); embedded formulas or linked songs or chants (as among Gende, Kamano, or Trobriand Islanders); tacit contextual associa-

tions and symbolic allusions (as among Baktaman, Bimin-Kuskusmin, Fore, Gende, Gimi, Gnau, Hua, Huli, Iatmül, Jate, Kai, Kamano, Keraki, Siane, Telefolmin, Umeda, or Usurufa); entitlements to know, to explicate, and to narrate bound to a complex sociology of sacred knowledge and related rules of secrecy, taboo, and revelation (as among Baktaman, Bimin-Kuskusmin, Elema, Kera-ki, or Marind-Anim); and intricate linkages with forms of art, magic, music, and ritual (as among Abelam, 'Aré'aré, Elema, Ilahita Arapesh, Kwaio, or Sambia). Most myths are cast in the form of narratives and are sometimes interconnected in complex cycles; examples of these mythic cycles are the delicate mosaics of origin myths among the Nalum of the Star Mountains of Irian Jaya, the narratives of the founding ancestress Afek in the Mountain-Ok region of Papua New Guinea, the key Massim myths of canoe voyages and *kula* exchange transactions, and the mythic culture-hero cycles that pervade the whole of Melanesia. Other myths, however, may also be both danced and sung (Waropen), embedded in linked cycles of songs (Kiwai), or enacted in magical or ritual dramas (Elema, Marind-Anim) to enhance their performative efficacy or elocutionary force in creating a sacred cognitive-affective experience.

Despite their occasional entertainment value, the casual way in which they are often told, and their abstract literary qualities, the myths of Melanesia are profoundly anchored to the local foundations of sociocultural existence. They are portraits of various phenomena of sacred significance, "characters" (in Bronislaw Malinowski's sense) that both elucidate and legitimate fundamental institutional forms and practices, and narrated performances that are believed to affect the course of events of concern to human communities. The performance aspects of myth in Melanesia are less well understood than similar features of ritual, although there have been numerous studies of the place of myth *vis-à-vis* male initiation ritual (as among Awa, Baktaman, Bimin-Kuskusmin, Chambri, Gnau, Ilahita Arapesh, Mianmin, Ndumba, Sambia, or Telefolmin) and noteworthy analyses of myth by Jan van Baal (1966) on Marind-Anim, Catherine H. Berndt (1955) on the Kai-nantu area (Fore, Jate, Kamano, Usurufa), Kenelm O. L. Burridge (1969) on Tangu, S. Hylkema (1974) on Nalum, John LeRoy (1985) on Kewa, Roy Wagner (1978) on Daribi, and Michael W. Young (1983) on Kalauna. A linguistically and symbolically sophisticated approach to the ethnography of mythological discourse in Melanesia, however, is evident only in incipient and rudimentary form. Attention has been directed primarily toward more descriptive, functional, or structural characteristics of portrayals of mythic personae, landscapes, origins, migrations, and other sacred phenomena. Analysis of these mythical portraits has focused on varied aspects of their subjects' cultural, existential, psychological, social, or even theological significance in times of both stability and change.

PERSONAE OF MELANESIAN MYTH. Characters in Melanesian myth are variously and loosely identified as deities or primordial creator spirits, culture heroes, remote or recent

ancestors, totemic figures, local spirits, demons or ogres, forest spirits, and tricksters. The notion of a supreme deity or creator is found rarely, or remains doubtful as an interpretation of local belief, in most areas of Melanesia, with the possible exceptions of the hierarchical societies of eastern Melanesia (notably Fiji) and the northwest and northeast coasts of Papua New Guinea. Certain renowned and omnipotent figures sometimes also appear in Melanesian myths, such as Enda Semangko (Kyaka Enga); Honabe (Huli); Marunogere (Kiwai); Oma Rumufa (Siane); Ora Rove Marai (Roro); Parambik (Ngaing); Sinatu, Mubu, and Obomwe (Garia); and Ye (Rossel). Although creative or regulative beings are known in most of the area's mythologies (except among the Tangu), such spirits rarely have the elaborate Polynesian features of the Kalou-Vu and other deities of the Fijian pantheon. Indeed, in eastern Melanesia at the Polynesian frontier cosmogonic myths and their portraits of the generative powers and acts of mythic creators are generally more intricate and are interwoven with representations of social hierarchy. In this subregion, myths tend to place greater emphasis on ideas of duality; totemic concepts; complex culture-hero or trickster cycles (at times almost as elaborate as those of the Polynesian Maui myths); images of regeneration, reproduction, or reincarnation (often in serpentine form and less bound to ideas of garden fertility than in western Melanesia); regional integration; and autochthonous origins—all in support of fundamental creation in and of the cosmos. In other parts of Melanesia, however, mythic creators are usually assigned less than cosmogonic tasks.

MYTHS OF COSMOGONY. Myths of origin, found in almost every cultural repertoire of Melanesian myth, generally assume the preexistence of the fundamental characteristics of the cosmos. When described at all, the primeval era is often portrayed either as a mosaic of basic elements, structures, and processes—earth, water, sky, astronomical bodies, the underworld, and the forces of wind, rain, tide, and temperature (Huli, Iatmül, Mae Enga, Marind-Anim, Mbowamb, Rossel)—or as a period of chaos, marked by cataclysms, storms, fires, floods, volcanic eruptions, eclipses, comets, and earthquakes, to be eventually put in order (Bimin-Kuskusmin, Orokaiva, Tangu, Trans-Fly, Waropen). Indeed, this primordial chaos is often paralleled by the mythical moral disorder attributed by many Melanesian peoples to the fringes of their known world (Bimin-Kuskusmin, Marind-Anim, Trans-Fly).

More often, however, such myths largely ignore cosmogony, focusing instead on subsequent modifications or transformations of terrain or seascape, flora, fauna, human-kind, and culture or society brought about by important creators, culture heroes, totemic figures, or ancestors. Some of these mythic characters are both creative and regulative. Responsible for particular facets of cosmic order, they dwell in or near human settlements and supplicants, taking an interest in human affairs and often intervening in them. Other mythological beings are primarily or only regulative, possessing few if any creative powers but monitoring and interven-

ing in human affairs after the establishment of the essential cosmic, moral, and social orders.

Culture heroes, on the other hand, are usually only creative. Soon after completing their acts of creation, they abandon human society, taking no further interest in its continuing affairs. But ancestral and totemic figures—through genealogical or ethnohistorical links with social groups founded on principles of descent or locality—tend to be significantly associated with the ongoing sociocultural life of particular communities. They model, validate, and also regulate aspects of the social, economic, moral, political, and ritual orders.

ORIGINS OF HUMANITY. In most Melanesian origin myths, primordial transformations reveal little sense of an original paradise and are attributed to various forms of hostility, to breaches of morality, and to conflict—often incest (Bimin-Kuskusmin, Huli, Marind-Anim, Waropen) but also adultery, desecration, homicide, rape, rebellion, sibling rivalry, suicide, treachery, and theft. The first humans are sometimes created through primeval acts of incest, although myths of ancestral parthenogenesis or virgin birth are also known (Bimin-Kuskusmin, Sambia, Trobriand Islanders). The original humans are depicted as emerging not only from the bodies of primordial humanoid forebears, but also from various sacred or mysterious cassowaries (Bimin-Kuskusmin), earthworms (Ndika), eggs (Rossel), stems (Kiwai), pigs (Tangu), palms (Keraki), and ground holes (Trobriand Islanders). Sometimes they emerge from other sources and sites—land, sea, sky, or perhaps some unknown, unmapped netherworld. Although they are occasionally completely formed, the first humans most often are molded or hardened by hand or by fire or sun into fully human form. They are then endowed with sensory, sexual, reproductive, and judgmental capacities, as well as other attributes of personhood (Bimin-Kuskusmin, Ilahita Arapesh, Marind-Anim, Trans-Fly). Once they are minimally human, these early beings are usually further endowed not only with the essential cultural artifacts—of gardening, fishing, hunting, and other productive activities—but also with such institutions as marriage, child-rearing, ritual, magic, exchange, warfare, sorcery or witchcraft, and other foundations of Melanesian ideas of ethics, morality, and social order.

If the mythic bestowal of life, humanity, and sociality is complex and profound, the advent of death is usually associated with an apparently trivial incident that could well have had a different outcome—often involving some kind of acquisition or display of improper knowledge, emotion, or behavior and sometimes cast in the image of the shedding of skins and the apparent immortality of various lizards and snakes (Bimin-Kuskusmin, Kiwai, Trobriand Islanders). Yet Melanesian ideas of immortality tend to be ambiguous, and mythic beings are often given corporeal forms and mortal fragilities despite their recognized invisibility and supernatural powers. In turn, the complex symbolic relationships of birth, death, rebirth, and regeneration are commonly articu-

lated in myths focused on and perhaps embedded in fertility, initiation, funerary, cannibalistic, and head-hunting rituals (Bimin-Kuskusmin, Gimi, Hua, Keraki, Marind-Anim, Trobriand Islanders).

CONTOURS OF THE COSMOLOGICAL LANDSCAPE. Myths of origin in Melanesia are often concerned with the primordial roles of sun, moon, stars, and other celestial phenomena and with the fundamental separations of water and land, earth and sky, valley and mountain, plain and river, night and day, and other key contours of a cosmological landscape (Bimin-Kuskusmin, Kyaka Enga, Tolai). The distinctions of forest, garden, and hamlet, or of sea, shore, and inland village, however, are often relegated to a later time when the sense of domesticated space and human community became apparent. Separations of the realms of natural and supernatural or living and dead are more problematic in both conception and representation, for many mythic spirits are imagined to live near human settlements and to be involved with their affairs. Indeed, these spiritual abodes are sometimes described as mirror images of, or as significantly overlapping with, the social world of the living.

The acquisition of fire commonly marks the inception of humanity and community. According to many Melanesian myths, the original fire, which is denied to beings other than the morally human, is usually brought by spirits, created by sacred lightning, or hidden in the body of an ancestral being—perhaps an old woman or a totemic animal (Bimin-Kuskusmin, Marind-Anim, Nalum, Trans-Fly). Sometimes the advent of fire is linked to the origin of a major food or of ritual plants and animals—especially taro, sweet potatoes, yams, sago, and valued wild flora, as well as cassowaries, dogs, pigs, marsupials, pythons, fruit bats, crocodiles, dugongs, and sharks. Such foods and the taboos applied to them are mythically portrayed as key sociocultural markers of self and person (Bimin-Kuskusmin, Hua, Manga, Ndumba). The common mythic theme of interwoven animal, plant, and human fertility is often bound to ideas of the generative powers of male and female substances, anthropophagic symbols, and images of human heads and acts of headhunting (Bimin-Kuskusmin, Marind-Anim, Rossel, Trans-Fly).

ORIGINS OF SOCIETY AND CULTURE. Throughout Melanesia, the beginnings of particular societies are attributed to both autochthonous origins and primordial migrations, which are often revealed in different contexts and serve distinct functions in the domains of ritual and ethnohistory (Bimin-Kuskusmin, Kwermin, Lagaip Enga, Umeda). It is in the context of these migrations that the culture heroes of Melanesia are often found. These culture heroes—including figures known over wide regions, such as Qat (Banks), Sido (Kiwai), Sosom (Marind-Anim), Souw (Daribi), Tagaro (Vanuatu), and Warohunuga (Solomons)—establish key aspects of sociocultural order, test the limits of morality, institute basic productive practices, introduce significant flora and fauna, and otherwise determine or shape the foundations

of community. Often coming from a nearby land, the culture hero journeys across the known world, explores new frontiers, discovers new horizons, encounters strangers, enemies, or unknown women, travels to the realm of the dead, and shapes the world of the living. His exploits transform him profoundly and lend significance to the present condition of humankind. As he embarks on his odyssey of discovery, intrusion, indiscretion, insight, and creation, he is often cast as one member of an elder-younger sibling or cross-cousin set, and he marks the cultural boundaries of both cross-generational and male-female relationships. In exploring the moral boundaries of a community, the culture heroes exhibit some affinity with various local spirits, demons, ogres, fools, and tricksters, such as Gabruurian and Kamdaak Waneng (Bimin-Kuskusmin), Kakamora (San Cristoval), Masi (Ulawa), Muu-muu (Mala), Pakasa Uru and Tulagola (Lakalai), Tukis (Buka), and Yevale (Yéi-nan), but these figures never have the creative capacities of Melanesian culture heroes.

The myths of culture heroes introduce the sociological themes that are the foci of so many Melanesian narratives. Matters of egalitarian and hierarchical ethos and social order pervade the mythologies of western and eastern Melanesia, respectively. Ancestor spirits are genealogically and mythically marked in the descent ideologies of patrilineal, matrilineal, and cognatic Melanesian societies in different ways, but most of these societies—except in the patrilineal Highlands of New Guinea and hierarchical eastern Melanesia—emphasize the recently dead and largely ignore more remote ancestors. Although the myths of the classic New Guinea Highlands are substantially lacking in totemic figures or emblems, many fringe Highland and other Melanesian myths do associate totems with clans or moieties (Abelam, Bimin-Kuskusmin, Dobuans, Iatmul, Lakalai, Mountain Arapesh, Ngaing, Orokaiva, South Pentecost). Such mythic totemic figures may have few ritual implications (Keraki, Kiwai, Yéi-nan) or be associated with elaborate ancestor cults (Bimin-Kuskusmin, Marind-Anim).

Although Melanesian myths concerning ancestors and totems serve significantly as a community's corporate property, as charters of local or descent groups, and as the basis of claims on various social resources, many myths subtly depict a range of relations—between siblings, men and women, and generations—as a model extending from the family to the widest contours of social structure. Sibling relations are significant in almost all Melanesian myths. Emphasis is placed on either elder-younger (brother-brother, sister-sister) or male-female (brother-sister) configurations, with implications for matters of either generation or gender in transformations of the mythic sibling model (Bimin-Kuskusmin, Ilahita Arapesh, Mae Enga, Murik). Mythic portraits of generational relations tend to explore themes of authority and sexuality between parent and child and of amity in grandparent-grandchild relationships (Bimin-Kuskusmin, Mae Enga, Mountain Arapesh, Sambia). In turn, myths de-

picating gender relations tend to focus on substance, power, purity, and pollution; on the sexual division of labor; and on cultural images of virgins, wantons, witches, and female elders. These myths develop local ideas of primordial matriarchy and their ritual and political consequences (Asaro, Awa, Benabena, Bimin-Kuskusmin, Fore, Gadsup, Gahuku-Gama, Gimi, Hua, Jate, Kamano, Sambia, Siane, Tairora, Usurufa, Yagarua).

NEW FIELDS OF STUDY. Although the themes noted above have significantly shaped the described or analyzed character of Melanesian myths as they have been portrayed in more than a half century of anthropological study, several other foci are also worthy of special note. First, there is now a quite considerable tradition of concern with syncretic myths, which are subtly linked to mission Christianity or to various millenarian or messianic cargo cults. These analyses, which introduce the critical element of sociocultural change into the study of Melanesian mythology, extend to all major areas of the cultural region. Second, studies conducted in the second half of the twentieth century on Daribi and Kewa myths stressed the flexibility, metaphoric character, and creative potential of Melanesian myths, which are seen as complex forms of communication that play on ambiguity, trope, and innovation. Third, analyses of Kalauna and Tangu mythology emphasize the ways in which mythic understandings become variously embedded in both personal and public senses of self, person, experience, and symbol. In these studies, the analysis of Melanesian mythology has finally come to the forefront of anthropological interest, field research, and theoretical concern and promises to enrich this field of inquiry beyond traditional measure.

BIBLIOGRAPHY

The literature on Melanesian myths is immense and enormously varied, although it has remained primarily descriptive until quite recently. In the earlier periods of scholarly interest in Melanesia, the journals *Anthropos* (Salzburg, 1906–), *Baessler-Archiv* (Berlin, 1959–), *Folk-Lore* (London, 1890–), *Journal de la Société des Océanistes* (Paris, 1945–), *Journal of the Polynesian Society* (Wellington, New Zealand, 1892–), *Journal of the Royal Anthropological Institute of Great Britain and Ireland* (London, 1871–), *Man* (London, 1901–), *Oceania* (Sydney, 1930–), *Zeitschrift für Morphologie und Anthropologie* (Leipzig, 1899–), *Deutsche Gesellschaft für Anthropologie, Ethnologie und Urgeschichte* (Braunschweig, Germany, 1870–1920), and other publications printed myriad unannotated texts of Melanesian myths. Despite the sterility of this early practice, the tradition of presenting such textual materials on mythology is being continued not only in some of the periodical literature listed above, but also in the exemplary anthologies of the Summer Institute of Linguistics, the Société d'Études Linguistiques et Anthropologiques de France, and the Institute of Papua New Guinea Studies, as well as in the journals *Bikmaus* (Boroko, Papua New Guinea, 1980–) and *Oral History* (Boroko, Papua New Guinea, 1973–). The vital importance of providing appropriate ethnographic context, however, is now recognized in these endeavors to establish an archive of Melanesian oral traditions.

There are many early but altogether excellent ethnographic studies of Melanesian cultures and societies based on the tradition of field research that give detailed and significant—if not focal—attention to mythology. A fine, sensitive, but highly descriptive presentation of numerous mythic and other texts that provides a rich sense of their ethnographic contexts is to be found in Gunnar Landtmann's *The Folk-Tales of the Kiwai Papuans* (Helsinki, 1917). A somewhat similar study is well represented in G. Camden Wheeler's *Mono-Alu Folklore (Bougainville Strait, Western Solomon Islands)* (London, 1926), which provides extensive annotations of many texts and thoughtful comparisons with diverse Melanesian myths, but which portrays a somewhat superficial sense of relevant ethnographic context.

The problem-centered, theoretical analysis of Melanesian myth, however, becomes more prominent in the era of functionalist concerns, which emphasize the intricate embeddedness of mythology in the cultural fabric of social institutions. Thus, the place of myth in a system of morality enforced and sanctioned through oracles is splendidly illustrated in Reo F. Fortune's *Manus Religion* (Philadelphia, 1935). The intertwined cultural, social, and psychological characteristics of myth and its key functions as a charter of magical, ritual, and social institutions is remarkably portrayed for Trobriand gardening beliefs and practices in Bronislaw Malinowski's *Coral Gardens and Their Magic*, 2 vols. (London, 1935), and for the theoretical and comparative study of myth in Malinowski's *Magic, Science and Religion and Other Essays* (New York, 1948), which draws heavily on a range of Trobriand myths. A sensitivity to the psychocultural nuances of Melanesian mythology, however, is not generally a hallmark of the functionalist tradition and, beyond Malinowski's work, is perhaps best carried forward in John Layard's *Stone Men of Malekula* (London, 1942), which marvelously explores the cultural, psychological, and ritual character and context of myth on the islands of Malekula and Vao in the New Hebrides (now Vanuatu).

The analysis of Melanesian myth moves well beyond a simplistic concern with both function and charter in the seminal but little-recognized studies of the Keraki and other Trans-Fly groups and of the Elema, documented in Francis Edgar Williams's *Papuans of the Trans-Fly* (Oxford, 1936) and *Drama of Orokolo* (Oxford, 1940). A master of ethnography and no slavish adherent of functionalist dogma, Williams challenges the foundations of Malinowski's faith in mythic charters and opens new ground by raising significant questions about the cultural embeddedness, semiotic construction, and psychological importance of myths in Melanesia and elsewhere. In these several regards, Williams's central concern is to address the subtle relationships between mythic and ritual forms—an issue that is also richly explored in the magnificent studies of the Marind-Anim portrayed in Paul Wirz's *Die Marind-Anim von Holländisch-Süd-Neu-Guinea*, 2 vols. (Hamburg, 1922–1925), and in Jan van Baal's *Dema* (The Hague, 1966).

The classic study of the mythology of New Caledonia is beautifully represented in Maurice Leenhardt's *Do Kamo: Person and Myth in the Melanesian World* (1947; reprint, Chicago, 1979). In his exploration of matters of experience, epistemology, and personhood through myth and the nuances of the anthropological study of myth, Leenhardt provokes a depth

of insight into Canaque myth that provides inspiration from Lucien Lévy-Bruhl to Claude Lévi-Strauss in the unraveling of Melanesian *mythologiques*. Yet the contemporary study of New Caledonian mythology, as admirably exemplified in Alban Bensa and Jean-Claude Rivière's *Les chemins de l'alliance* (Paris, 1982), is far less philosophical in its theoretical foundations and reflective in its methodological moorings and attempts to promote a more “scientific” emphasis on ethnosemantic classificatory schemas and sociopolitical patterns implicated in mythic narratives.

The state of the art in the anthropological study of Melanesian mythology is well examined and summarized for the period ending in the early 1960s in *Gods, Ghosts and Men in Melanesia*, edited by Peter Lawrence and M. J. Meggitt (Melbourne, 1965). This overview suggests how little progress had been made in the study of the myths and religions of Melanesia before the 1960s, which represented what might be called a renaissance of academic interest in Melanesian religions. Prior to this time, there is particularly little exploration of mythology in the New Guinea Highlands, with the notable exception of the monumental study of Fore, Jate, Kamano, and Usurufa origin, *kinihera*, and other genres of myth in Catherine H. Berndt's “Myth in Action” (Ph.D. diss., London School of Economics, 1955).

The modern era in the study of Melanesian mythology exhibits two particularly significant trends: (1) a comparative examination of mythological and other aspects of millenarian, nativistic, or cargo cult movements; and (2) a new emphasis on mythology as the focus of ethnographic interest and theoretical analysis. In the first instance, mythological portraits of the significance of sociocultural change, of altered conceptions of personhood, self, society, and cosmos, and of revitalized traditional or newly syncretic images are compared throughout much of Melanesia in Peter Worsley's *The Trumpet Shall Sound* (London, 1957) and in Kenelm Burridge's *New Heaven, New Earth* (New York, 1969).

In the second instance, however, the study of Melanesian myth comes fully into the mainstream of the best academic explorations of myth. These new and exciting analytic undertakings are perhaps best represented in a limited set of exemplary articles and in the monographic work of five scholars. The mythic exploration of moral ambiguities and dilemmas is insightfully examined in a Kamano text in Catherine H. Berndt's “The Ghost Husband: Society and the Individual in New Guinea Myth,” *Journal of American Folklore* 79 (1966): 244–277. Subtleties of the conceptual images and internal paradoxes of Kaliai culture and society as represented in a single myth are unraveled in Dorothy Ayers Counts's “Akro and Gagandewa: A Melanesian Myth,” *Journal of the Polynesian Society* 89 (1980): 33–64. These analyses show the power of exploring the nuances of a single mythic narrative in elaborate sociocultural context. In contrast, a comparative examination of the dialectical relationship between sociocultural experience, moral order, and mythic representation in the Eastern Highlands region of Papua New Guinea is admirably constructed in John Finch's “Structure and Meaning in Papua New Guinea Highland Mythology,” *Oceania* 55 (1985): 197–213.

Whether focusing within or beyond a particular sociocultural community, the monographic endeavors variously attend to

problems of the comparative analysis of myth. The complex and subtle relations between mythology and matters of personhood, self, morality, and experience in Tangu society are elegantly dissected in Kenelm Burridge's *Tangu Traditions* (Oxford, 1969), which delicately probes the intricate way in which myth is variously embedded in diverse ethnographic contexts and which forcefully demonstrates how myths become crystallizations of cultural themes and of both social and personal experiences. Exploring a tension between the disclosure of immoral realities and the revelation of existential truths, enigmatic and oracular Tangu myths unveil dilemmas of the local human condition. How such mythic crystallizations are constructed and manipulated creatively and through complex understandings of cultural tropes is analyzed admirably for Daribi mythology in Roy Wagner's *Habu* (Chicago, 1972) and *Lethal Speech* (Ithaca, N.Y., 1978), which also attend to broader comparative issues in assessing the commonalities and peculiarities of Daribi myth in New Guinea and in Melanesia. The significance of variations among versions of myths with respect to the cultural discrimination of social differences and to the transformational characteristics of a corpus of myths within a particular society is illustrated in exemplary fashion for Nalum mythology in S. Hylkema's *Mannen in het Draagnet* (The Hague, 1974). The subtle interplay between narrative compositions and pragmatic experiences, between intertextual resonances and textual references, between the surfaces and the depths of constructed layers of meaning, and between the fanciful and the factual of cultural contradictions and social conflicts, is marvelously explored in the "fabricated worlds" of Kewa *lidi* myths in John LeRoy's *Fabricated World* (Vancouver, 1985), which is usefully complemented by a fine collection of the analyzed myths in *Kewa Tales*, edited by LeRoy (Vancouver, 1985). Finally, the problem of how myths—usually conceived as particular forms of collective representations (in the Durkheimian sense)—become articulated with personal symbols and subjective experience and embedded in autobiographical narratives is superbly examined in Michael W. Young's *Magicians of Manumana* (Berkeley, 1983). These new studies reach well beyond the descriptive and analytic limits of their predecessors and hold much promise for the future of academic understandings of the subtleties of mythological constructions in the Melanesian cultural region.

FITZ JOHN PORTER POOLE (1987)
Revised Bibliography

MELQART, whose name means "king of the city" (*milk qart*), was the patron god of the Phoenician city of Tyre and one of the major gods of the Phoenician and Punic pantheons. He was also known as Baal Sur (Lord of Tyre) and was identified with Herakles (Hercules) since at least the sixth century BCE. There is no longer any doubt about his link with Tyre (the "city" of his name) since the publication in the 1990s and early 2000s by Pierre Bordreuil of explicit epigraphical evidence, including a seal, tesserae, dedication, weight, and sling balls.

PHOENICIA AND SYRIA. The earliest epigraphical evidence on Melqart appears on a statue found near Aleppo (Bredj), Syria, dating from about 800 BCE. The royal Aramaic votive inscription bears the name of Barhadad, who probably was king of Arpad. This document is an important trace of commercial and cultural contacts between Northern Syria and Phoenicia, especially Tyre, which explains why an Aramaic king made such an offering to a Tyrian god. Melqart is represented on the stela, standing, striding from right to left, with a naked torso and bare feet, bearded, with a loincloth and a dome-shaped hat, a fenestrated ax on the shoulder (a royal symbol) and carrying what may be an ankh or a lotus flower in the right hand (a symbol of immortality). This is clearly a composite image, with Egyptian and Syro-Hittite affiliations. The same iconography, with a standing or seated god (on a throne), is also attested in different Mediterranean contexts (Cyprus, Carthage, Ibiza, Sardinia), but it is not certain that it always refers to Melqart.

Although the first reference to Melqart belongs to the beginning of the first millennium BCE, different literary sources link him with the founding of the city of Tyre, and Herodotus (II, 44) reports that, according to the priestly traditions, Melqart's Tyrian sanctuary was as old as the city itself. It is likely that Melqart's cult was based on a longtime religious tradition, the cult of royal ancestors, which is well attested in Mesopotamia and Syria until the third millennium BCE. However, Melqart became the poliadic god of Tyre, with this specific name, only at the beginning of the first millennium BCE, when Tyre became a great commercial center with a Mediterranean dimension. In fact, Josephus (*A.J.*, VIII, 145–146; *C.Ap.* I, 117–119) records that Hiram I, the king of Tyre during the tenth century BCE, built new temples for Melqart (Herakles) and Astarte in the city and celebrated for the first time the *egersis*, which was the resurrection ritual of Melqart, in the month of Peritios (February–March). During this annual ritual, the god "died" (perhaps in a fire) and was awakened or resuscitated, perhaps through a sacred marriage (*hierogamos*) with the goddess Astarte. In this celebration, the Tyrian king probably played the role of the god, and a priestess played the role of the goddess.

Later in Cyprus and in the Punic world, a ritual title applied to important citizens is attested, surely in connection with Melqart's *egersis*: "The one who makes the god(s) awaken, bridegroom of Astarte(?)." In Greek inscriptions found in Amman, Ramleh, and Ashkelon, this function is translat-

ed as “*egerseites* of Herakles.” On a vase, presumably from Sidon, there is a probable iconographical representation of the main moments of Melqart’s *egersis*. In addition, in Gades (Spain), Hercules/Melqart’s bones were kept (Pomponius Mela III 46). These elements seem to fit well with the known Frazerian pattern of the “dying and rising god,” but this pattern has been critically challenged because it is an artificial construction that does not reflect the great diversity of the historical and “theological” backgrounds of the so-called dying and rising gods, a category that includes Osiris, Dumuzi, Attis, Adonis, and others. In Melqart’s case, it appears clear that the annual ritual death and resurrection means that every year the natural, cosmic, sociopolitical, and religious order was renewed with and through the king. It is not simply a “naturalistic” ritual, but a way to assure fertility, order, peace, and wealth for all the people, because, as the Semitic royal inscriptions say, the king—mythical and historical—“makes his people live.” It is also interesting to notice that Astarte seems to be the mother and *paredros* (companion) of the god. According to Cicero (*N.D.* III, 42) and Philo of Byblos (Eusebius, *P.E.*, I, 10, 27, 3), the Tyrian Herakles was the son of Zeus Demarous (from *Dmrm*, the “Warrior,” possibly an epithet of Baal) and Asteria (Astarte); he was killed by Typho in Libya and was brought back to life by the goddess, who made him smell roasted quails (Eudoxus of Cnidos, fr. 284).

Direct evidence. After the Aleppo inscription, Melqart appears in two vassal Assyrian treaties. First, Melqart is mentioned in the treaty of 754 BCE between Matiel, king of Arpad (Northern Syria) and Ashurnirari V, king of Assyria. Here Melqart is included in the group of gods who warrant the treaty; together with Eshmun (the Baal of Sidon), Melqart is also named in the treaty of 675–670 BCE between the kings Esarhaddon of Assyria and Baal of Tyre. This treaty regulated the shipping and overland trade routes, and Melqart is included in the group of Tyrian gods, together with Astarte and Eshmun: “May Melqart and Eshmun deliver your land to destruction and your people to deportation; may they [uproot] you from your land and take away the food from your mouth, the clothes from your body, and the oil for your anointing” (Parpola and Watanabe, 1988, vol. II, p. 27).

Various scholars hold that the cult of Baal that King Ahab and his wife Jezebel, a Tyrian princess, introduced into Israel in the ninth century BCE (1 *Kgs.* 16), and against which the prophet Elijah fought on Mount Carmel (1 *Kgs.* 18:20–40), was in fact a cult of Melqart. The text that narrates the challenge between Elijah and Baal’s prophets alludes to a god who sleeps and travels, like Melqart, the god of the *egersis* and the companion of the Tyrian expansion on the Mediterranean shores. But the god Baal Shamin (Lord of the Heaven) is another good possibility for the Carmel episode. In the sixth century BCE, Ezekiel’s oracle against Tyre (*Ez.* 28:1–19) probably refers to the cultural background of the Tyrian kingship when he places in the king’s mouth these words:

“I am a god, I sit on a divine throne, in the heart of the seas.” The Tyrian betyls (standing stones) that symbolize the city’s power (*Ez.* 26:11) are probably the two stelae that Herodotus (II, 44) describes in Melqart’s shrine and that are represented on the city’s coinage. They were a symbol of his dominion, as were, later, the columns of Herakles at the end of the Western world (Libya, then Gibraltar). These elements prove that an aniconic tendency, maybe the older form of the cult, was still present in the worship of Melqart, especially in Tyre and Gades, though anthropomorphic figures are also known. On the Tyrian coinage, the Heraklean symbols occur frequently in the Hellenistic and Roman period. In the fifth century BCE a sea god riding a hippocampus is depicted, which could be Melqart represented as the protector of commercial expansion, but this is not certain.

When Alexander the Great reached Tyre in the fourth century BCE and began the siege, because of his Heraklean genealogy he tried to manifest his devotion to the Tyrian Herakles (Melqart), making several offerings in his temple (Arrian, *Anab.* II, 16–24). But by that time the Hellenization of the cult was already deep, and it is difficult to distinguish the local Semitic god and its Greek interpretation; one deals with a syncretistic figure (Melqart/Herakles) in a syncretistic context (the Hellenistic period). The Greek iconographical language completely covers the original Phoenician image, which is very poorly attested.

Just as the Tyrian influence expanded through the Mediterranean by way of trade and colonization, so did the cult of Melqart. The “Lord of Tyre” was also the “sailors’ god” (Diodorus XX, 14), who traveled with the population. Melqart thus became one of the major figures of the ancestral religious traditions for the western Phoenicians (Punic people). For example, it is known that the Tyrian founders of Carthage and Gades brought on their ships, together with their families, relics of Melqart (Justin XVIII, 4, 15; XLIV, 5, 2). In these colonial contexts, the foundation of a sanctuary for Melqart, often *extra muros*, was probably one of the first concerns of the new inhabitants because the sanctuary was a neutral and sacral space that offered an adequate context for the first commercial and social contacts with the local populations. Melqart’s temples probably had an important economic function, perhaps serving as “treasuries” of commercial exchanges through a system of tithe, but this aspect of his cult is still hypothetical because of the lack of documentation.

Elsewhere in Phoenicia and Syria, Melqart is mainly attested in Amrith (together with Eshmun), Sarepta (if he is the “holy god” of the inscriptions), Umm el-Awamid (under the name of Milkashtart), Jamnia, and Ascalon.

BEYOND PHOENICIA AND SYRIA. From Phoenicia, Melqart’s devotion expanded in the eastern Mediterranean.

Cyprus. The first step was Cyprus. There Melqart is documented in several places: Kition, Amathus, Idalion, and Larnaka, which were the major centers of Phoenician coloni-

zation since the ninth century BCE. In Kition-Bamboula, Melqart's sanctuary was near Astarte's, while in Kition-Batsalos there is epigraphical evidence of a common cult to Melqart-Eshmun. In many Cypriot cult sites, a Heraklean iconography, similar to that present on the Syrian coast (Amirth) since the sixth to fifth centuries BCE, is present. It may allude to Melqart, but probably also alludes to other cults, including Reshef /Apollo and some anonym Cypriot god, as if the Heraklean shape were a standard male god iconography. Cyprus was thus a crucial place for the iconographical assimilation between Melqart, the royal god, perhaps associated with the lion (as in the Eastern iconography of the smiting king or god), and the Greek Herakles, who became the god with the *leonte*, the bow and the club. The Idalion cup (eighth century BCE) is the best illustration of this assimilation process.

Greece. Although there is little specific evidence of Melqart in Greece, it is probable that Samos was an important stage on the road that brought Melqart/Herakles from Phoenicia and Syria to Greece, through Cyprus and perhaps Rhodi, where an "awakener of the god" is attested, surely in connection with Melqart's cult. In Samos, where Hera looks much like Astarte, there is a famous pectoral (625–600 BCE) with the first Heraklean image of the hero with the *leonte*. Otherwise, Melqart's name never appears on Greek soil.

Herodotos reports (II, 44) that Melqart was venerated in Thasos as the *archegetes* of the city, just as the Thasian Herakles was venerated in Tyre, but excavations have not provided any evidence of this. In Crete, the Phoenician presence (at least in Kommos) is well documented, but Melqart does not appear, although the Cretan Herakles Daktylos may have some relationship to him and to the Egyptian Bes. Another important site in the religious map of the Greek world is Delos, where different oriental communities settled for commercial reasons. The Tyrian group considered Melqart as their patron god and therefore took the name of Heracleistes. Their decree (ID 1519) records that on the Aegean island they regularly practiced Melqart's cult as their *archegetes* during the second century BCE.

Africa. Though the monarchy disappeared in Carthage, Melqart, the royal god par excellence, remained popular as a symbol of the Phoenician roots of Carthaginian people, like the goddess Astarte. The divine couple, Melqart and Astarte, already attested in Phoenicia, survived in the Punic context and was often translated in Greek and Roman sources through the *interpretatio graeca* or *latina*: Herakles/Hercules for Melqart, and Aphrodite/Venus or Hera/Juno, especially but not exclusively, for Astarte. In Carthage, Melqart's cult provided one of the most important occasions to maintain the relationships between Tyre and its major Punic colony. Every year during Melqart's feast a tithe was sent from Carthage to Tyre to demonstrate the people's fidelity to the great ancestral god and to Tyrian traditions. When the Carthaginians interrupted this custom, they were badly punished by the god with war and epidemics, as reported by Diodorus of

Sicily (XX, 14). In the famous treaty between Hannibal and the Macedonian king Philippos V in 215 BCE, Herakles (with the Carthaginian *daimôn* and Iolaus), who must surely be Melqart (Polybius VII, 9, 2–3), is mentioned among the Punic gods.

Elsewhere in Africa, Melqart is present in Leptis Magna (as Milkashtart, together with Shadrafa), Sabrata (as Hercules), El Hofra, and Lixus, where the classical authors placed the Hesperian garden.

Spain. In Spain, where Phoenician people founded emporia as early as the eighth century BCE, the main center of Melqart's cult was Gades. The evidence is entirely Greek and Latin, and relatively late, so it is difficult to determine what belongs to the Phoenician god and what to his later classical brothers. It is likely that Phoenician, Greek, and Roman cults were practiced together in a clearly syncretistic context, where each believer was able to recognize his own god.

Milkashtart, who could be a god similar to Melqart and who was also assimilated to Herakles/Hercules, appears in Gades in the second century BCE. His name alludes to a royal god (Milk) of Ashtarot, a Palestinian place name, and not to Ashtar/Astarte. The cult of Melqart/Herakles/Hercules propagated in several places in southern Spain, as demonstrated by local coinage with Heraklean symbols or images, including Herakles' head, bowl, and club, but the chronology of such a phenomenon is not clear. It is probable that the brief Punic dominion on Spain in the third century BCE under the leadership of the Barcides, a family who had a special devotion for Melqart, reinforced the god's presence in Spain. The Barcides imitated Alexander's coinage with the Heraklean head.

The cult of Melqart is also known through epigraphical and iconographical evidence to have been present in Ibiza. Scholars are not aware of any mythological cycle of Melqart's adventures similar to those surrounding Herakles, neither in Ibiza, the far West, or the East. The Western episodes of Herakles' myth are particularly important because they constitute the antecedent of his death and apotheosis. The West, the Sun's house, was considered to be the end of the world, a fabulous land where a person could communicate with the netherworld. But nothing similar is known about Melqart, and the old idea that the "city" contained in his name was the city of the dead is not convincing.

Italy, Malta, and Great Britain. Melqart is found in all Phoenician colonies, including Sardinia, Sicily, and Malta. In Sardinia, there is little evidence of Melqart's presence in Tharros, the most important Phoenician colony on the island, apart from a temple, known from an inscription. Astarte is much better documented, particularly on iconographical grounds, and these two gods probably formed a divine couple, as they frequently did elsewhere. Melqart is also documented in the Sid/Sardus Pater's sanctuary in Antas.

In Sicily, the name of Melqart occurs as a theophorous element in the onomastics, but there is no cultural evidence.

He was nevertheless probably venerated in different places, for example in Selinus, where the cult of Herakles is well documented, and in Mozia, where the famous statue of the Young of Mozia (fifth century BCE) has been interpreted as Heraklean iconography. Melqart also appears in the place-name Roshmelqart (Cape of Melqart), which is documented in inscriptions and on the coinage but has not yet been definitively identified. In Sicily, the Heraklean presence is strong and is reinforced through the interaction (often violent, in the form of a conquest and assimilation) with indigenous cults.

In Malta, Melqart certainly had a temple, which is mentioned by Ptolemy as Herakles' temple; the location was revisited in 2003 by Nicholas Vella. The twin stelae with double bilingual inscriptions in Phoenician and Greek were probably offered in this temple to Melqart, Baal of Tyre, and to Herakles, *arhegetes* of the Tyrians, that is, the founder, the "leader of the foundation" (Donner and Röllig, 2002). These texts enabled Jean-Jacques Barthélemy to decipher the Phoenician scripture in 1758. Astarte's cult is also well attested in Tas Silg in Malta.

Pyrgi is the most important site in continental Italy, which has something to do with Melqart. The evidence is both epigraphical and iconographical. The bilingual Phoenician and Etruscan inscription on the laminae includes a dedication to Astarte/Uni from the local king on a special occasion: "the day of the burial of the god" (Donner and Röllig, 2002). The name of this god is not explicitly mentioned, but the iconographical evidence may indicate that he was Melqart—in the decoration of Pyrgi's temples (A and B), Heraklean motifs are common, probably in connection with the cults practiced there. In the Forum Boarium on the Ara Maxima in Rome, the local Hercules had economic and commercial functions. Because of the relationships between archaic Rome and different oriental groups (Cypriots and Phoenicians, maybe through the Etruscans), the Forum Boarium's Hercules could have some oriental connotations, just like he also has deep Greek shapes, but he is surely not *sic et simpliciter* Melqart.

Phoenician traders probably settled in Corstopitum in Great Britain, the cult site of both their ancestral gods, during the Imperial period. Melqart, translated as Herakles, and Astarte (*Inscriptiones Graecae*, XIV, 2253–2254) remain together, even in such a remote place.

From the rich evidence discussed above, from all the Mediterranean shores, scholars conclude that Melqart was one of the most important gods of the Phoenician and Punic world. He was primarily a royal god who was linked with the Syro-Mesopotamian background of the cult of royal ancestors and who had some chthonic, salvific, and healing connotations. Because of the commercial vocation of Tyre and its expansion in the West, Melqart became a god of the sea, who took the Tyrian people to the colonial world. He was not simply a vegetation god, an example of the dying-god typology, but rather a king who protects the population and assures

security, victory, wealth, fertility, and stability. Melqart was thus the king's prototype in historical times. His cyclical death, recorded in a special ritual that involved the king, means that without the king's mediation between the divine and the human sphere the world cannot function, fertility ceases, and fecundity disappears, as in the Ugaritic Kirta myth. The annual death and resurrection (*egersis*) of Melqart must demonstrate what a society without a king (a catastrophic event) means and how it is important to reestablish and confirm the primary importance of the king in the balance between life and death, power and destruction, fertility and desolation. This pattern surely includes the life of nature and vegetation, but it goes far beyond.

CORINNE BONNET (2005)

MEMORIZATION, as the act of storing information in the memory, is distinguished by the fact that it can be either mechanical or deliberate. It is through practice and imitation, through the mechanical repetition of the traditional gestures and speech of his social group, that the individual, without actually realizing it, memorizes most of the information necessary for proper social and religious behavior. Taken in this sense, memorization culminates in the acquisition of

the innumerable actions, of behavior, thought, and sensibility, that define a social and cultural identity. From the classic texts of Maurice Halbwachs on social memory and Marcel Mauss on bodily techniques to the more recent studies of André Leroi-Gourhan on mechanical operatory chains and Erwin Goffman on interaction rites, this type of memory acquisition has been the object of numerous investigations that need not be considered here. It is sufficient to emphasize that, in contrast to this kind of memorization, there exists another, deliberate form, the techniques of which become especially prominent when certain individuals are momentarily separated from their usual social group in order to take part in an initiatory ritual or to become part of an educational institution. These extreme cases do not apply to all members of a community, however, and those to whom they do apply are never required to memorize everything, but only those gestures, techniques, and special narratives that are of particular importance, as for example certain ritual formulas, declarations of faith, religious chants, prayers, and rules of religious behavior. Deliberate memorization thus appears to be a specialization of the more natural process of acquiring knowledge and techniques, religious or otherwise, that unconsciously determine a person's membership in a particular tradition.

To this initial distinction, between mechanical and deliberate memorization, can be added another, which does not coincide with it, but applies to each term independently: the techniques and practices of memorization, be they mechanical or deliberate, vary according to whether they are associated with orality or writing. Studies by Laura Bohannon, E. A. Havelock, and Jack Goody have established that memory is organized differently when written records and models are available; without writing, memory does not function as exact reproduction, but rather as generative recollection that ties repetition to variation. It would be wrong to think that this second distinction is historical. Oral memory and memory determined by writing can easily coexist in the same culture, as the Greek, Jewish, Celtic, and Hindu examples to be mentioned below will show. This is also still the case in contemporary cultures. In the exposition that follows, which must be limited to only a few examples, will be traced a line that leads from the oral to the written. At each stage it is necessary to respect the double contribution of mechanical memorization and deliberate memorization.

In societies without writing, riddles, proverbs, myths, fables, and stories depend upon a memory that is more or less shared by the entire community. In this sense, one can speak of "social memory" or "shared knowledge." However, memorization is often an activity left to the free choice of individuals, to their tastes, affinities, and personal gifts. Henri Junod (1936) recalls a woman among the Tsonga who could tell riddle after riddle until late into the night. He met storytellers of every age and of both sexes: "Such a narrator might know only one story, and repeat it on every occasion, as did Jim Tandane, who told the story of an ogre, Nwatlakou-

lalambibi, with such enthusiasm that he was nicknamed after his hero! But others can tell six, ten, or twenty stories" (p. 159).

In certain societies, in particular among the Native Populations of North America, the knowledge and the possession of a myth or chant may be the privilege of an individual, who alone may pronounce it. It is for this reason that a Navajo of New Mexico may give as a sign of his poverty the fact that he does not own a single chant. A chant thus becomes a piece of "property" that concerns his own social and spiritual identity.

Most often, however, it is because certain stories are of an important collective interest that they are entrusted to the vigilant memory of one or more persons. The task of memorization is then taken up by a specific institution, often religious. These institutions are generally controlled by an elite close to power. In Rwanda, the oral tradition of the Ubwiru, in which the rites to be performed by the king were described, was divided into eighteen rituals that were kept strictly secret. In an essay on this oral tradition Pierre Smith (1970) notes that "the individuals in charge of remembering and repeating it word for word—errors could be punished with death—were the most important dignitaries in the kingdom, and the most important three among them, the only ones who knew the text as a whole, partook of the sacred character of royalty" (p. 1385). Such "memory specialists" can be found wherever a community expresses in narrative its needs to preserve its identity. In Oceania, the experts in oral tradition, the "holders of memory," were assembled in colleges analogous to religious confraternities. The most famous among them, portrayed by Victor Ségalen in *Les immémoriaux*, were the *harepo* of Tahiti, who were the keepers of the genealogies, myths, and epics.

These orators were given true responsibility only after a serious examination, composed of difficult tests. The least mistake in memory was enough to eliminate a candidate, whose preparation was the responsibility of the priests. It is said that the *harepo* practiced in complete isolation, during long nocturnal walks. The transmission of ancestral knowledge rested with them. These story tellers were surrounded by a whole set of religious rituals. (O'Reilly and Poirer, 1956, pp. 1469–1470)

On Easter Island, the *rongo rongo*, from noble families often attached to the king, used to teach chants and oral traditions in special huts. Alfred Métraux (1941) describes how this oral tradition is learned: "The student's memory was perfectly trained. During their first years of schooling, they had to learn certain psalms by heart, which they recited while playing cat's cradle: each figure . . . would correspond to a chant to be recited" (p. 168).

Among the Inca, the education of the nobility was the responsibility of the *amautas*, who were of aristocratic descent. Their instruction lasted four years. The first year was devoted to the learning of the Quechua language; the second year to learning the religious traditions; and the third and

fourth years to the handling of the famous knotted strings, the *quipu*.

Memorization, as it is practiced by such specialists, becomes a technique that can be taught, and that has its appropriate equipment. The Peruvian *quipu*, the *kou-bau* made by the *rongorongo* on Easter Island, the skeins of coconut fiber adorned with knots made in the Marquesas Islands, the wooden tablets of the Cuna Indians in Panama, and the pieces of bark of the Ojibwa Indians of North America do not, strictly speaking, constitute writing systems, but they do represent mnemotechnical means pertaining to oral memory. The same is true of certain systems of pictographic notation, such as the Aztec ideograms. Fernandon de Alva Ixtlilxóchitl recalls that the Aztec used to have writers for each type of history:

Some would work with the *Annals* [Xiuhamatl], putting in order the things which took place each year, giving the day, the month, and the hour. Others were charged with the genealogies and ancestries of the kings and lords and persons of lineage. . . . Others took care of the paintings of the boundaries, the limits, and the landmarks of the cities, provinces, and towns, and [recorded] to whom they belonged. (quoted in Léon-Portilla, 1963, p. 157)

These “writers” used pictographs to construct a mnemonic system that later historians could refer to, provided that they also referred to the purely oral tradition of the chants (*ibid.*, p. 156), since as a system of notation it was not sufficient in itself for the total preservation of information. It was necessary in addition to have recourse to the memory that was transmitted by word of mouth through the traditional chants. One finds a similar situation, *mutatis mutandis*, in the early days of Islam, when to read the Qurʾān it was necessary that one already know it, since writing was still too rudimentary to be the sole means of transmission.

In oral cultures, memorization remains closely tied to the conditions of performance, despite the use of mnemonic techniques. Between listening and repeating, the absence of a fixed model does not allow for exact word-for-word repetition. Variability is essential, even though the transformations from one speaker to another often go unnoticed. There is no original version that others could reproduce, or from which they could depart. Claude Lévi-Strauss suggests that there is nevertheless a logical model, which follows certain laws of transformation. Although reproduction is not determined by the ideal of fidelity to an original (a “text”), this does not mean that it thereby becomes prey to arbitrariness. Its flexibility, its adaptability, respects certain formal conditions. “Understood in this way,” notes Dan Sperber,

the facts presented by Lévi-Strauss, these peculiar correspondances and regularities, represent the intellectual capital available for primitive thought, and more particularly . . . for storing and retrieving information in the absence of the external memory which writing provides. Thus the study of myths can clarify the nature of

human thought itself, in some of its least known aspects. (*Le savoir des anthropologues*, Paris, 1982, p. 115)

As logical as these rules of transformation can be, and as apt be enlightening on the workings of the human mind, they are not incompatible with trivial motives. Take, for instance, what Edmund Leach (1954) reports of the Kachin of Burma:

Kachins recount their traditions on set occasions, to justify a quarrel, to validate a social custom, to accompany a religious performance. The story-telling therefore has a purpose; it serves to validate the status of the individual who tells the story, or rather of the individual who hires a bard to tell the story, for among Kachins the telling of traditional tales is a professional occupation carried out by priests and bards of various grades (*jaiwa, dumsa, laika*). But if the status of one individual is validated, that almost always means that the status of someone else is denigrated. One might then infer almost from first principles that every traditional tale will occur in several different versions, each tending to uphold the claims of a different vested interest. (Leach, 1954, pp. 265–266)

This amounts to saying that the priestly bard adjusts his stories to the requirements of the audience who hired him. The horizon of expectation, the “reception,” appears to be a constitutive component of oral memory, a component that conditions the very notions of fidelity and truth.

Oral memory does not like writing; there are numerous examples of this. This is not simply because it knows that writing can place it in contradiction with itself. It is primarily because the standard of truth is different for each. To understand this phenomenon better, one may turn to cultures where the two types of memory coexist. First the Celts, where the specialists of the sacred, the druids, ran their own schools, in which the main subject was memorization. According to an Irish judicial treatise, the *ollam* (the highest ranking scholar) was considered the equal of a king; he could recite 350 stories, 250 long ones, and 100 short ones. “As for the tenth-ranked *oblaire*, who makes do with leftovers at a feast, and whose escort is small, only seven stories suffices.” The druids, who were the only Celts who knew how to write, refused to use their skill for religious purposes. “They say,” wrote Caesar,

that they learn a great number of verses by heart: some spend twenty years at their school. They believe that religion forbids the use of writing for this purpose, unlike any other purpose such as recording public or private stories, for which they use the Greek alphabet. It seems to me that they established this usage for two reasons. On the one hand, they did not want their doctrine to spread among the people; on the other hand, they did not want those who study to rely on writing and neglect their memory, since it often happens that the use of texts has the effect of reducing efforts to memorize by heart and weakens the memory. (*Gallic Wars* 6.13)

Georges Dumézil (1940) comments on this testimony as follows: “knowledge is reincarnated in each generation, in each

student; it is not received as a deposit; it assumes a form which, even while retaining its meaning and its essential traits, rejuvenates it and in a certain measure actualizes it." It is this dynamic, flexible, and adaptable character of oral memory that is threatened by writing. This is apparent from recent testimonies as well, such as that of a native of New Guinea (Humboldt Bay), who told an ethnologist, "in putting down our myths and legislative rules in writing you just kill them." According to Freerk C. Kamma (1975) "he meant to say: to fix or stabilize a progressing living reality means to cut it off from accompanying the living community."

In India, the *brahmins* who teach the Vedas are specialists in the techniques of memory, even though the Vedas have for a long time been fixed in writing. Louis Renou has noted that

there is something fascinating in the process of memorizing the verses. The master stares at the student while feeding him the verses, so to speak, with an implacable regularity, while the student rocks back and forth in a squatting position. After looking on for a few moments in such a recitation class, one better understands the hymn of the *Rgveda* (7.103) in which this monotonous delivery has been likened to the croaking of frogs. (Renou, 1950, p. 36)

A precise description of the techniques of memorization in the Vedic schools can be found in the fifteenth chapter of the *Rk Pratisakhya*, an old phonetic and grammatical treatise.

E. A. Havelock and Marcel Detienne have insisted on the coexistence of two types of memory in ancient Greece up until the time of Plato: (1) written memory and (2) social memory that is still dependent on oral tradition. Thus it is noteworthy that, although archives were available from the end of the fifth century BCE, it never occurred to Greek historians to refer to them as historical sources more reliable than the tradition transmitted by the works of their predecessors (appraised according to their degree of verisimilitude) or transmitted by the experience of sight (*autopsia*) or hearing (testimony). And yet, already from about 470 BCE, Pindar and Aeschylus employ the metaphor that represents memory as an inscription, on the tablets of the soul, of what is fit to be remembered. Shortly before, the poet Simonides is said to have invented the art of memory, a technique built upon the metaphor of writing, which will undergo an important development, passing by way of Roman rhetoric (Quintillian) to the Renaissance. At the beginning of the fourth century BCE, Plato is obviously preoccupied with the negative effects of the invention of writing on memory. And Antisthenes of Athens recommends according more trust to personal memory than to the external memory of written annotations.

Although Homer appears to have been a necessary reference point in ancient Greece, since his written text was learned by heart in the schools and was recited by specialists at religious festivals, there was no religious text that had au-

thority over others. Nor was there a class of religious specialists, comparable to the *pontifices*, *flamines*, and other Roman colleges, or to the Celtic druids or Vedic brahmins. Essentially pluralist and political, Greek religion was a religion without dogmas. It obeyed customs, which varied from region to region, and from one sanctuary to the next. As a result, correct practice depended on diverse forms of information derived from a variety of sources: the family, the tribe, the town, and so on. Certain religious practices, such as those connected with the mysteries or with divination, were sometimes reserved for certain families or circles of initiates (for example, the Eumolpides and the Ceryces, the Iamides, the Trophoniades), but every Greek, regardless of social status, was capable of addressing a prayer to the gods or performing the actions indispensable to a sacrifice. Deliberate memorization, and for that matter writing as well, appeared as religious practices only in the context of such marginal devotions as Orphism and Pythagoreanism.

In the Judaic tradition, memorization plays a different role in the study of the written Torah than it does in the study of the oral Torah. The written Torah is taught through reading. The transmission of the text, teaching of the scriptures, and public readings, must all be done from a book. Even if these activities eventually result in the memorization of the text, and in fact many rabbis do know the text by heart, it is specified that the written Torah must never be copied from memory. On the other hand, the oral Torah is taught through repetition from memory, even though written notes may be used as a mnemotechnic device, and even though, at an early date, the Mishnah, and then the Talmud, was committed to writing. The masters of the oral Torah, the *tannaim* ("teachers"), were like living memories, capable of reproducing an impressive number of traditions. Their knowledge, often mechanical and lacking in reflection, was used as a reference source by the rabbis and colleges. A famous example is Natronai ben H̄avivai (eighth century), who wrote down the entire Talmud from memory after immigrating to Spain.

In the Christian tradition, the role of memorization seems to be much less important, although from the fourth century there are references to religious schools where the Psalms, the words of the apostles, prayers, and passages from the Old Testament, were learned by heart. In the Divine Office, for instance, the use of a breviary, even though required to be recited aloud, served as a substitute for memorization. Thus blindness could relieve a monk of the obligation of reciting the hours, save for what he knew from memory.

In Islam, which is a religion of the word as much as a religion of the book, memorization was essential from the very beginning. The words of the Prophet, which repeated the Archangel Gabriel's reading of the archetypal book, were transmitted orally by a group of the companions of the Prophet and by specialists in memorization before the Qur'an was finally written down. From the time of the third caliph, writing made possible the fixation of the tradition,

but it never did away with recourse to memory. In effect, to read the Qurʾān in its primitive form, it was necessary to know its contents. Later, writing and memorization continued to be closely related practices. The Qurʾānic schools (*madrasas*) were tied to a mosque. Children came to learn the Qurʾān by heart, even before they could read. These schools also taught the *ḥadīths*, the tradition that was guaranteed by a chain of authorities, or *isnad*. Before being written down in such texts, such as that of al-Bukhari, this tradition was transmitted orally. The information it gives about the acts and words of the Prophet are used to regulate daily life down to the smallest details, in profane as well as in religious matters. The tradition represents the Prophet himself, sitting in the mosque and teaching the *ḥadīths*. His words are repeated three times by all present, until they are known by heart.

MEMORY SEE ANAMNESIS; MEMORIZATION

MENCIUS SEE MENGZI

MENDELSSOHN, MOSES (1729–1786), German-Jewish philosopher and public figure of the Enlightenment

period. Born in Dessau, the son of a poor Torah scribe, Mendelssohn received a traditional education that, rather exceptionally, included the study of the philosophy of Moses Maimonides. In 1743 Mendelssohn followed his teacher to Berlin to continue his Jewish studies. There he was able to acquire considerable knowledge of contemporary mathematics, philosophy, poetry, and classical and modern languages. The German dramatist and critic G. E. Lessing encouraged Mendelssohn to publish his first German essays and used him as the model for the tolerant and modest Jew in his play *Nathan the Wise*. In 1763 Mendelssohn received first prize from the Prussian Royal Academy of Sciences for a treatise on evidence in metaphysics; in the same year he was granted the status of “protected Jew” with rights of residence in Berlin. Mendelssohn supported himself successively as family tutor, bookkeeper, manager, and partner of a Berlin Jewish silk manufacturer; his home became a gathering place for Berlin intellectuals. In the nineteenth century members of the Mendelssohn family (most of whom converted to Christianity after Moses’ death) achieved considerable financial, academic, and artistic prominence.

GENERAL METAPHYSICAL AND RELIGIOUS WRITINGS. Mendelssohn’s philosophical position was derived from the English philosophers John Locke (1632–1704) and Shaftesbury (1671–1713) and especially from the German rationalists Gottfried Wilhelm Leibnitz (1646–1716) and Christian Wolff (1679–1754). The publication of Mendelssohn’s *Phädon* (1767), a work on the immortality of the soul and named after Plato’s dialogue, established his reputation among the enlightened public. Drawing on Leibnitz’s theory of monads, Mendelssohn argues that souls are primary, imperishable elements that impose unity on the changing features of the body. Continued personal consciousness of the soul after death is guaranteed by God, inasmuch as divine wisdom and goodness would not allow the soul to relapse into nothingness without fulfilling its natural impulse to self-perfection. *Morgenstunden, oder Über das Dasein Gottes* (Morning hours, or lectures on the existence of God, 1785), the most methodical of Mendelssohn’s major works, moves from a discussion of epistemological issues to the importance of a belief in God, providence, and immortality for man’s happiness, to a formal ontological proof of God’s existence.

JEWISH WRITINGS AND ACTIVITIES. In the mid-1750s Mendelssohn collaborated in a short-lived Hebrew weekly and published a commentary to Maimonides’ treatise on logic. He was forced to speak out as a Jew, however, after 1769, when he was publicly challenged to explain why he, an enlightened man, did not convert to Christianity. In a reply to the Swiss pastor, Johann Kasper Lavater, Mendelssohn rejected the implication that his loyalty to Judaism was inconsistent with his innermost enlightened religious convictions and devotion to rational inquiry. In the 1770s Mendelssohn used his influence with liberal Christians to deflect threatened anti-Jewish measures in Switzerland and Germany. In connection with efforts to protect the Jews of Alsace, Men-

delssohn encouraged Christian Wilhelm von Dohm to write his classic defense of the civic betterment of the Jews but demurred from Dohm’s support of limited judicial autonomy for Jews and the right of Jewry to excommunicate recalcitrant Jews.

Mendelssohn’s translation of the Pentateuch into German was published in 1780. It was accompanied by a commentary (the *Bi’ur*) that draws on both traditional exegesis and modern literary aesthetics. Often reprinted, the translation drew the ire of some traditionalist rabbis but served as an important bridge to modern culture for many young Jews in the nineteenth century.

JERUSALEM, OR ON RELIGIOUS POWER AND JUDAISM. Mendelssohn’s principal contribution to Jewish thought was the result of yet another challenge by a Christian, this time concerning an alleged inconsistency in his supporting the abolition of excommunication while remaining loyal to biblical law, which condones coercion. Mendelssohn’s reply, *Jerusalem, oder Über religiöse Macht und Judenthum* (1783), was one of the first works in German to plead for freedom of conscience in religious matters, separation of church and state, and (indirectly) civil rights for the Jews. According to Mendelssohn both states and church have as their final goals the promotion of human happiness. The state is permitted to enforce specific actions, whereas the church’s task is to convince its followers of their religious and ethical duties through persuasion alone. To the question of the continued authority of Jewish law, which was adumbrated by Spinoza in the *Tractatus Theologico-Politicus*, Mendelssohn replied that the ceremonial law stemming from the Hebrew Bible is binding solely on the Jewish people; Judaism is a religion of revealed legislation, not of revealed beliefs. The existence and unity of God, the reality of divine providence, and the immortality of the soul are to be affirmed on the grounds of natural reason, not miracles or supernatural revelation. Mendelssohn acknowledges the importance of Spinoza in the history of philosophy but vigorously rejects Spinoza’s pantheism. Spinoza’s primary concern was the noninterference by the state or religious authorities in the intellectual freedom of the philosopher and scientist. Mendelssohn, while still affirming the continued authority of Jewish law, was concerned with freedom inside one religion as well as freedom of religion for minority communities.

Mendelssohn argued that the identification of church and state in biblical Israel ceased with the destruction of the ancient commonwealth; laws remaining in force are personal religious duties that preserve the universal principles of Jewish faith against lapses into idolatry and polytheism. These laws will not lose their force until God arranges another indubitable supernatural revelation to the Jewish people to supersede that of Mount Sinai. Loyalty to the Jewish law, however, does not prevent Jews from assuming the legitimate duties of citizenship in an enlightened society.

THE PLACE OF MENDELSSOHN IN THE HISTORY OF JEWISH THOUGHT. Although Mendelssohn’s synthesis of philosoph-

ical theism and traditional religious observance was viewed as outdated by the next generation of Jewish thinkers influenced by Kant and Hegel, Mendelssohn could be seen as forebear of the conflicting trends of nineteenth-century German Jewry: Reform, for his openness to change; and Neo-Orthodoxy, for his insistence on the binding nature of Jewish ceremonial law. Mendelssohn's disciples among the writers who collaborated with him in the *Bi'ur* were prominent in the Jewish Enlightenment (the Haskalah) that emerged in Prussia in the 1770s and later spread to eastern Europe. Mendelssohn was revered by the Enlighteners (*maskilim*) for having moved from the ghetto to modern society without abandoning the Jewish tradition or the Jewish people. In the 1880s, however, at the end of the Haskalah period, Mendelssohn was assailed for having paved the way to the loss of Jewish distinctiveness and, therefore, to assimilation. In retrospect, his thought and life can be seen to have posed some of the fundamental issues of Jewish religious survival in secular, liberal society.

BIBLIOGRAPHY

The standard edition of Mendelssohn's writings is *Gesammelte Schriften Jubiläumsausgabe*, 7 vols., edited by Fritz Bamberger and others and incompletely published between 1929 and 1938; a completed edition in 20 volumes is being prepared under the editorship of Alexander Altmann (Stuttgart, 1971–). The most recent English translation of *Jerusalem* is by Allan Arkush, with an introduction and commentary by Alexander Altmann (Hanover, N.H., 1983). Useful is *Moses Mendelssohn: Selections from His Writings*, edited and translated by Eva Jospé (New York, 1975). The magisterial biography of Mendelssohn is Alexander Altmann's *Moses Mendelssohn: A Biographical Study* (University, Ala., 1973). On Mendelssohn's role in the intellectual history of Judaism, see Michael A. Meyer's *The Origins of the Modern Jew: Jewish Identity and European Culture in Germany, 1749–1824* (Detroit, 1967), chap. 1; Julius Guttman's *Philosophies of Judaism*, translated by David W. Silverman (New York, 1964), pp. 291–303; and H. I. Bach's *The German Jew: A Synthesis of Judaism and Western Civilization, 1730–1930* (Oxford, 1984), pp. 44–72.

Revised Bibliography

MENDICANCY. As a religious term, *mendicancy* (from the Latin *mendicare*, "to beg") denotes renunciation of all worldly possessions and the practice of begging alms from door to door. The custom is of ancient origin and, although

its observance has varied in character from place to place, the general impetus for the phenomenon seems to have derived from an idea that the discipline of living solely on alms is conducive to the attainment of spiritual goals. Early in the Vedic period, *brahman* mendicants had precise rules for soliciting alms, and among the ancient Greeks, mendicant priests went from place to place in quest of alms on behalf of their favorite deities (e.g., Isis and Artemis Opis). Among the Romans, certain priests who were bound by vows of temperance received support from public almsgiving. (According to some critics, these mendicants had occasionally to be reminded to restrain their extravagant demands; see Cicero, *On the Laws* 50.) Although religious mendicancy is a phenomenon that still finds acceptance in varying degrees in a number of cultures, it is chiefly within the Hindu, Buddhist, Christian, and Islamic traditions that it has won sanction as a religious practice.

In the Hindu tradition, pious men with sons to carry on the family line have long had open to them a renunciant ideal by which they may give away their possessions to *brahman*s and go forth into homelessness, first as a hermit (*vanaprastha*) and later as a mendicant (*sannyāsin*) who begs from door to door. Individuals from different ranks of society have sometimes chosen to devote themselves to a life of poverty and meditation, dependent for support upon others. The Hindu mystic's quest for illumination, for union with ultimate reality, generally promotes such an attitude of indifference to worldly concerns, and, since liberation (*mokṣa*) from them is one of the recognized aims of a Hindu's life, the asceticism of the mendicant is perceived as a positive means for achieving that goal.

In Buddhism, the monastic enterprise instituted by Gautama Buddha was probably derived from even more ancient Vedic ascetic movements. For the Buddhist, renunciation of the world is considered meritorious in that it allows the devotee to dedicate his or her energies to the task of delivering people from suffering. Both laypersons and monastics subscribe to mendicancy as a practice leading to the lessening of attachment and, hence, ultimately to *nirvāṇa*. The daily life of the monastic mendicants usually includes regular rounds from house to house for the purpose of gathering alms; whatever food is placed in their bowls is to be accepted gratefully. Monks and nuns are exhorted to follow specific rules (e.g., not discriminating between houses when begging, eating solely from an alms bowl, eating only one meal per day, etc.). They are instructed that no real value obtains in external performances; only if alms-gathering is attended by the desire for *nirvāṇa* can this discipline be meritorious. Although the practice of begging food and alms still prevails in most countries where Buddhist monasticism exists, meals are also often brought to the monasteries so that the laypeople may acquire extra merit.

In early Christian history, pious mendicants (Lat., *solitarii*, *gyrovagi*) wandered through city and countryside, preaching and begging alms, but they usually did not meet

with popular acceptance. Jerome, for example, complained that some of these *solitarii* were accustomed to wandering from house to house, often leading people astray and living a life of luxury at the expense of other Christians. Monastic or semimonastic communities were in existence by the beginning of the fourth century and, although their inhabitants may have had to resort to begging during hard times, they generally sustained themselves by their own labors. It was not until the time of Francis of Assisi and Dominic (twelfth and thirteenth centuries) that mendicant orders as such arose and eventually became sanctioned by the church hierarchy. The appearance of these mendicant orders ensued as a protest against the corruption within certain established monastic communities (a problem with which the mendicant orders themselves had to deal at a later time, when abuses crept into their own communities).

Four mendicant orders were approved by the Council of Lyons (1274): Franciscans, Dominicans, Carmelites, and Augustinians. Francis insisted that his followers own nothing whatever, for they were to be “pilgrims and strangers in this world,” living with confidence in God’s care and subsisting on alms received from those among whom they preached and worked. After the deaths of Francis and Dominic, however, church authorities mitigated the orders’ rules to allow for possession of worldly goods. From time to time, members of the Roman Catholic and Greek Orthodox churches have, in an attempt to return to the simplicity of the message of the Gospel, initiated reform movements that included mendicancy. Their belief was that through ascetic practices such as begging, Christians might rid themselves of the imperfections and sins that kept them from union with God—especially by placing one’s daily life in God’s hands (*divina providentia*)—by complete reliance on God for subsistence one might more quickly achieve that union with the divine. Toward the end of the Middle Ages, mendicancy as a religious practice was prohibited by the Roman Catholic church because of various abuses that had crept into the system.

Within Islamic tradition, there has generally been disagreement as to the value of mendicancy. Some have argued that, since the Qurʾān contains injunctions against begging, it is debatable whether dependence upon others for one’s sustenance is more virtuous than having independent means. Mendicancy on a broad scale came into vogue with the ninth-century Ṣūfīs; these were Muslim ascetics who interpreted *zuhd* (“renunciation”) in a strictly spiritual sense, viewing it as the abandonment of all that diverts one from God.

Many of the early Ṣūfīs carried the Islamic theory of *tawakkul* (“trust [in God]”) to an extreme, defining it as renunciation of all personal initiative and volition. Since everything is in God’s hands, Ṣūfīs were neither to beg nor work for pay but to depend on what God has sent as a gift, either directly or through the generous alms of others. This system often proved ineffective, and some Ṣūfīs wandered from place to place, trusting in God to provide their livelihood.

At times, the result was starvation and, gradually, Ṣūfīs concluded that trust in God and seeking a livelihood were not mutually exclusive. The words *faqīr* and *darwīsh* (Arabic and Persian for “poor”) are terms for religious mendicants who ask for food or money in the name of God. They profess a life of poverty and withdrawal from worldly pursuits for the purpose of deepening their spiritual insights and communing more intimately with God. Some mendicants follow their careers independently, and others (like their Christian counterparts) live communally. The doctrines of these mendicants and their orders are derived from Ṣūfī principles and beliefs, particularly those that stress dependence upon God.

Within these four religious traditions, mendicancy has generally connoted withdrawal from worldly possessions and worldly pursuits for the purpose of demonstrating and experiencing a sense of dependency upon God and/or a supreme life principle. Wherever mendicancy has become accepted as a religious practice, almsgiving also has been elevated to an act of merit whose efficacy is rarely surpassed by other virtues. It, too, is considered in positive terms as a way of distancing oneself from society in order to transcend the material world.

Revised Bibliography

MENG-TZU SEE MENGZI

MENGZI. The name *Mengzi*, meaning literally "Master Meng," is the honorific epithet of Meng Ke (391–308 BCE), known in the West as "Mencius." Mengzi defended and developed Kongzi's (Confucius's) teachings in response to various challenges in the highly diverse and contentious intellectual world of fourth-century BCE China. In the process, he expounded innovative views about heaven, human nature, the mind, and self-cultivation that proved to be of profound and enduring importance in the later Confucian tradition.

Mengzi was a native of Zou, a small state located at the base of the Shandong peninsula. Traditional accounts claim that he studied under Zisi, Confucius's grandson, but it is more likely that he was a student of one of Zisi's disciples. Mengzi's teachings bear some similarities to parts of the *Li ji* (Book of rites), which tradition ascribes to Zisi. One also finds common themes and ideas in recently excavated texts, which show that Mengzi was participating in an ongoing debate about the nature of the emerging Confucian tradition.

The earliest information we have about Mengzi's life comes from the text that bears his name. In its present form, the *Mengzi* consists of seven books, each of which is divided into two parts, which are further subdivided into sections of varying length. The shortest sections consist of brief dicta, while the longest extend to over two thousand words. These purportedly record the teachings of Mengzi and conversations he had with various disciples, friends, royal patrons, and rivals. Some accounts claim that Mengzi himself composed the text, others that it was compiled by his disciples with his approval and advice. In the second century CE, the *Mengzi* was edited and several "chapters" were discarded by Zhao Qi, who also wrote the first extant commentary.

The *Mengzi* had a place, but not a distinguished position, among Confucian writings until its remarkable ascent toward the end of the Tang dynasty (618–907). In the following Song (960–1279), Yuan (1206–1368), and Ming (1368–1644) dynasties it came to occupy a singularly important place in the Confucian scriptural pantheon. The great Zhu Xi (1130–1200) wrote a highly influential commentary on the *Mengzi* and included it, along with the *Analecst*, *Great Learning*, and *Doctrine of the Mean*, as one of the "Four Books"—a collection intended to serve as the gateway to Confucian learning. In 1315 the Mongol court recognized the *Mengzi* as a classic and secured its preeminent position within the tradition. Since that time the text has enjoyed remarkable influence and prestige. It is one of the most highly studied Confucian classics among contemporary scholars.

CENTRAL TEACHINGS. Mengzi is renowned for advocating the theory that "human nature is good" (*xing shan*; 6A2, 6A6). A central claim of this theory is that heaven has endowed human beings with nascent moral "sprouts" (*duan*), which are the defining features of human nature (2A6). These innate moral tendencies are active and observable aspects of human nature, but they do not exhaustively describe the nature of human beings. They are the beginnings of morality, but like all sprouts they require a period of growth, care, and the right kind of environment in order to reach maturity (2A2, 6A7). The sprouts of morality are sensibilities of the heart-and-mind (*xin*), which is also the seat of human cognition, emotion, and volition. For Mengzi, the task of cultivating one's nature begins with an awareness of the moral aspects of the heart-and-mind, and consists in mobilizing the various faculties of the *xin* to protect, nurture, and develop these nascent moral assets. Successfully cultivating the moral sprouts, and thereby fulfilling one's nature, is the proper way to serve heaven, and in the course of this process one comes to understand heaven's decree (7A1).

Mengzi claims that four moral sprouts constitute the core of human nature; these serve as the bases of his four cardinal virtues: benevolence, righteousness, propriety, and wisdom (2A6). Throughout one's life, these moral sprouts regularly spring up—even though one often fails to notice or cultivate them. In certain contexts, in unguarded moments, they break through accumulated bad habits and indifference to manifest themselves in small, spontaneous moral acts. One of Mengzi's main tasks as a moral teacher is to help people notice, appreciate, and focus attention on such "give-away" actions.

Giveaway actions are one of several types of evidence Mengzi adduces for the existence of the moral sprouts. He also supports his claim about innate moral tendencies by posing hypothetical scenarios or thought experiments designed to illustrate the universal presence of moral feelings in human beings. For example, he asks us to imagine what one would feel if one were suddenly to see a child about to fall into a well (2A6, 3A5). Mengzi claims that every person facing such a scene would feel alarm and concern for the child. This spontaneous feeling of compassion shows that by nature we are creatures who care for one another.

Mengzi argues further that there is a heavenly endowed structure and hierarchy to human nature (6A14–15). Each of our various parts has a natural station and function that determine its place within the hierarchy and its relative value. No one who is aware of the natural hierarchy and its different functions would act against them, nor would such a person sacrifice a part of greater importance for one of lesser importance. The natural function of the *xin* is to reflect on and determine the relative merit of different courses of action because it alone has the capacity to consider, weigh, and judge among the various alternatives we face.

Mengzi never claimed that our innate moral tendencies alone guarantee moral development. These are only the be-

ginnings of virtue; they need attention, effort, and the right kind of environment to attain their full forms. Without sustained and concerted work, human beings will not become moral. His central metaphors for self-cultivation are agricultural (not merely vegetative) and farming requires attention, persistence, and a great deal of hard work. According to Mengzi, people are not born good; but rather are born for goodness (6A6). Our moral sprouts must ripen, as grain must ripen (6A19), before our true nature is revealed.

NEO-CONFUCIAN REVIVAL. Toward the end of the Tang dynasty, Mengzi and his teachings became a rallying point for a broad revival that modern scholars call neo-Confucianism. This important movement was propelled by a series of political, military, economic, and social crises that together motivated many Chinese intellectuals to regard their contemporary culture as corrupted, weak, and ineffective and to seek a renewal in an older, indigenous Chinese culture. A number of influential late Tang thinkers pointedly criticized Buddhism and Daoism for eroding and undermining Chinese culture. The former was especially castigated as a “foreign” and baleful influence on indigenous culture and was held responsible for a litany of social problems. Accompanying such criticisms were calls for a return to “traditional” Chinese culture, and the *Mengzi* proved to be one of the most important texts singled out for renewed interest.

Modern scholars tend to describe this rediscovery of the *Mengzi* in strategic terms. That is to say, the *Mengzi*'s teachings on human nature and the cultivation of the mind offered a version of the tradition that could effectively engage the sophisticated philosophies found in Buddhist and Daoist rivals. While there is some truth in this, such an account obscures the degree to which these “rival” traditions transformed the way all Chinese intellectuals thought about themselves and their world. It is more accurate to say that the *Mengzi* and other early texts favored by neo-Confucians, such as the *Doctrine of the Mean* and the *Great Learning*, were chosen because they fit what had become a new, general paradigm of thought, one that owed a great deal to the influence of Buddhism and Daoism.

Among the features of this new paradigm was a belief in a hidden, pure, fundamental nature and a manifest, defiled, physical nature. The former defines what we and other creatures *really* are while the latter corrupts our “original” nature and gives rise to everything bad. Our fundamental nature is shared with all things in the universe and unites us not only with all other human beings but with all creatures and things as well. Those who fully appreciate the true character of their nature understand this, and such insight allows them to “form one body” with all things. However, the understanding of most people is beclouded by the errant aspects of their physical nature, which give rise to and are reinforced by “selfish desires.” The task of cultivating one’s original heavenly nature consists primarily of eliminating the obscuring influence of such errant aspects. As a practical matter, this entails the elimination of selfish desires, a process that

enables one to find the “Mind of the Way” (*daoxin*) within the “Human Mind” (*renxin*).

Under the influence of this new paradigm, neo-Confucians reappropriated Mengzi’s teachings about a heavenly-conferred, morally good nature, along with its focus on the cultivation of the heart-and-mind. However, seen through this new lens, Mengzi’s original teachings took on a dramatically different form. For example, while Mengzi had advocated the sustained and gradual development of moral sprouts, neo-Confucians sought to discover and bring into play a fully-formed moral mind. This change generated a new and unprecedented belief in the inherent perfection of all human beings and a corresponding concern with “enlightenment” as a religious goal. Mengzi did not employ the stark contrast, common to most neo-Confucian thinkers, between a pure, fundamental nature in opposition to a corrupt yet reformable physical nature. Nor did he ever envisage anything resembling the way neo-Confucians deployed these basic metaphysical notions to construct a scheme in which human nature was fundamentally united with the rest of the universe. Nevertheless, the major neo-Confucian thinkers all saw themselves as inheritors and defenders of Mengzi’s line of the Confucian tradition.

The neo-Confucian revival was a vast, complex, and exceedingly rich movement that continued for more than a thousand years. However, many of its main themes were defined by the Lu-Wang and Cheng-Zhu schools. Both of these “schools” are loosely defined in terms of their respective emphases regarding the nature of the *xin* and the proper methods of self-cultivation. The former takes the thought of Lu Xiangshan (1139–1193) and Wang Yangming (1472–1529) as its primary sources of inspiration, whereas the latter looks to Cheng Yi (1033–1107), Cheng Hao (1032–1085), and Zhu Xi. Roughly speaking, members of the former school express a greater faith in the inherent purity and power of the *xin*. As a result, they tend to emphasize an extreme form of particularism in which every ethical decision and action is strongly dependent upon context, and moral progress is primarily a matter of personal reflection and struggle. They distrust rules, precedents, and conventions and advocate a radical independence on the part of individuals. Followers of the Cheng-Zhu school have an equally strong faith in the existence of a fundamental nature. However, they believe that human beings are guided to this nature primarily through a course of careful and dedicated study, practice, and reflection. They view adherents of the Lu-Wang school as self-indulgent and undisciplined and see their teachings and practices as the road to spiraling selfishness and deepening delusion.

Later Confucian thinkers such as Yan Yuan (1635–1704) and Dai Zhen (1723–1777) sharply criticized the followers of both the Lu-Wang and Cheng-Zhu schools for abandoning Mengzi’s original legacy. Both of these Qing dynasty (1644–1911) critics accused earlier neo-Confucians of incorporating too much Buddhism and Daoism into their

philosophy. They rightly pointed out that much of the metaphysical speculation underlying both Lu-Wang and Cheng-Zhu thought was alien to Mengzi and his age. Moreover, these foreign elements worked to obscure some of the most profound insights of Mengzi's original vision. Prominent among these is his emphasis on certain shared human reactive attitudes as the basis of the moral life. Both Yan and Dai insisted that our physical, embodied life, with all its feelings and desires, is the site of both our best and worst aspects. We must not look to obscure metaphysical theories for moral guidance. Heaven has endowed each of us with the means, and the Confucian tradition provides all of us with the Way. The challenge is to understand and practice the Way in order to develop the best parts of our nature to their full potential.

IMPLICATIONS OF MENGZI'S THOUGHT FOR RELIGIOUS ETHICS. Traditionally, religious ethics has had a difficult time bringing together a more anthropological, descriptive account of what is good for human beings and the prescriptions of revealed religion. An echo of this tension is seen as the central problem of modern philosophical ethics as well: how to reconcile one's personal interests with the demands of morality. Mengzi's thought appears to avoid many of the problems associated with at least the religious version of this type of challenge. For according to Mengzi, heaven has created us in such a way that we live the best lives possible for creatures like us only when we fully realize our heavenly endowed moral nature. Moreover, part of what heaven instills in us is a natural tendency and taste for morality and a natural aversion for what is morally bad. On such a view, there is no conflict between human flourishing and what heaven commands. In fact, a life in service to heaven is the only way to the most satisfying and pleasant life that human beings can have.

Such a view might lead one to ask if *heaven* is just an honorific term used to express approval for what human beings naturally find most satisfying. Does heaven place restrictions on what constitutes the human good? One possible response, which incorporates early Confucian concerns about the importance of natural harmony, is that heaven does constrain conceptions of the human good by serving as the source of all things in the universe. Humans seek harmony within the natural order but cannot fundamentally alter or damage this order without violating heaven's plan. While heaven is not a personal deity for Mengzi, it is an agent with a plan for the world, and that on occasion acts in the world to realize its will.

Mengzi's description of the religious life in terms of the *dao* and the degree to which knowledge of the Way is accessible to human beings are also issues of interest for religious ethics. Mengzi's reverence for Confucian learning, with its legacy of sacred texts, rituals, and sagely teachers, seems to privilege those within this tradition. On the other hand, he insists that heaven has endowed all human beings with the nascent sprouts that are the basis of moral knowledge. This seems to open up the Way to all who are prepared to dedicate

themselves to the task of self-cultivation. In thinkers like Wang Yangming, these aspects of Mengzi's teachings find expression as a profound faith that each and every person has a pure and perfect divine guide within.

These brief remarks only sketch Mengzi's thought and offer some suggestions about its value as a source for religious ethical reflection. What is beyond dispute is that his religious vision has inspired many of the best minds throughout East and Southeast Asia for more than two thousand years, and the *Mengzi* continues to challenge and inspire contemporary thinkers throughout the world.

MENNONITES. The Mennonites, a Christian denomination, were first called Menists, or Mennonites, in 1541 by Countess Anna of Friesland after the group's primary leader, Menno Simons (1496–1561). She used this name in order to distinguish the Mennonites, as peaceful settlers whom she welcomed in her lands, from other, revolutionary, groups. Historically and theologically, Mennonites are the direct descendants of sixteenth-century Anabaptists, a radical reform group in Europe.

EARLY HISTORY AND DOCTRINE. One of the most significant influences upon Mennonite history and identity has been the experience of decades of persecution during the sixteenth and seventeenth centuries. Numerous martyrologies, including the classic *Martyrs' Mirror* (1660), testify to this experience. The Mennonites lived in an age that was not ready for religious or social pluralism. In their insistence upon a church constituted of believers only, and in their embodiment of the principles of voluntary church membership and the separation of church and state, they represented a counterculture that society could not tolerate. In their reading of the Bible, however, they found these principles to be self-evident, particularly in the teaching and example of Jesus Christ. In keeping with the vision of their Anabaptist forebears, the Mennonites also shared the vision of a New Testament church restored both in essence and in form.

A church-world dualism was implicit in the Mennonites' theology and social view. It had been given early expression in the "Brotherly Union" of 1527, sometimes called the Schleithem Confession of Faith, article four of which states:

Now there is nothing else in the world and all creation than good or evil, believing and unbelieving, darkness and light, the world and those who are [come] out of the world, God's temple and idols, Christ and Belial, and none will have part with the other.

Toleration came to the Mennonites first in the Netherlands in the 1570s and somewhat later in other parts of Europe, except in Switzerland, where severe restrictions against them remained until the eighteenth century. Increasing freedom in the north led to rapid growth in membership, until by 1700 the Dutch congregations included 160,000 members. The sectarian virtues of frugality and hard work led to considerable affluence and to urbanization. Soon Mennonites became prominent patrons of the arts in the Netherlands. Numerous artists, poets, and writers from among their ranks achieved lasting fame. But the Enlightenment spirit of rationalism and secularism was also a part of these developments, and by 1837 there were only 15,300 members left in the

Netherlands. Late-nineteenth- and twentieth-century developments resulted in another increase in membership.

The early pattern of survival through withdrawal from society led to numerous migrations. Records indicate that emigration from the Netherlands eastward to Hamburg and along the coast to Danzig (present-day Gdańsk) began as early as 1534. Eventually large settlements developed in the Vistula delta. In 1788, migrations began from there to the Ukraine. By 1835 some 1,600 families had settled on Russian lands. By 1920 this population had grown to 120,000. But migration began again, this time from Russia beginning in the 1870s, primarily to North America.

A similar pattern prevailed among the Swiss and South German Mennonites. Many escaped Swiss persecution by migrating to the Palatinate or to central Germany. Others immigrated to the United States and Canada, beginning in 1663. The first permanent Mennonite settlement in the United States was established at Germantown, six miles north of Philadelphia, in 1683. Yet the total number of western European Mennonites coming to North America did not exceed 8,000, which, along with the approximately 55,000 immigrants from Prussian, Polish, and Russian lands, contributed to a core immigration to North America of no more than 70,000 up to the mid-1980s. There have also been migrations from North America, primarily from Canada to Mexico, Paraguay, Bolivia, and other Latin American locations. Thus pilgrimage has been central to Mennonite identity.

While Mennonites are non-creedal and affirm the Bible as their final authority for faith and life, they have written numerous confessions throughout their history. Chief among these are the *Brotherly Union* (1527) and the *Dordrecht Confession of Faith* (1632). In these the nature of the church as a believing, covenanting, caring, and obedient fellowship is central, as would be in keeping with the vision of restoring the New Testament church. The importance of the new birth and the authority of the Bible are stressed. Peace, including absolute pacifism, is considered an integral part of the gospel and, therefore, part of the discipleship of the believer. This discipleship is possible within the context of an Arminian theology, which acknowledges free will rather than Augustinian determinism. The second Adam, Christ, has undone the damage of the first Adam, making possible a gradual transformation of the disciple's life into the image of Christ himself. Ethics is a part of the Good News. Grace is necessary for discipleship rather than being antithetical to it. The believer who has experienced this grace is ready to receive baptism as a covenanting member of the "Believers' Church," a term commonly used since the 1950s to refer to those who are baptized as adults.

LATER DEVELOPMENTS. Partly through migration and natural increase, but particularly through twentieth-century missionary activities, Mennonites were scattered across the globe by the late twentieth century. In the early 1990s their total membership worldwide was approximately 800,000. The

Mennonite World Conference, begun in 1925, meets every five or six years for fellowship and the sharing of ideas, as well as for worship and celebration. It is not a delegate conference, and no decisions binding upon world membership are made.

The extent to which contemporary Mennonites hold to the doctrines of early Anabaptism varies from nation to nation, from group to group, and even from congregation to congregation. Mennonites do form regional and national conferences, but they are basically congregational in polity. The Amish, who split off from Swiss and Alsatian Mennonites in 1693–1697, as well as the Hutterites and some conservative Mennonites, do not form conferences. Historically, Pietism, more than other socioreligious movements, has influenced Mennonite theology; fundamentalism has also had an impact in North America. Both movements strengthen the inner, personal, and experiential aspect of faith but weaken social concern, pacifism, and the inherent church-world dualism of the sixteenth century. An enthusiastic recovery of the Anabaptist vision, led by Harold S. Bender (1897–1962), has modified these influences since the 1940s.

Anabaptists Four Centuries Later (Kauffman and Harder, 1975) provides a profile of late-twentieth-century North American Mennonite religious attitudes and practices. In relation to two doctrinal orthodoxy scales established in the study, 90 percent of the respondents chose the most orthodox response on a liberal-orthodox continuum. About 80 percent of the members could identify a specific conversion experience. The practice of daily personal prayer ranged from a low of 73 percent in one conference to a high of 82 percent in another. More than 80 percent reported regular Sunday school participation, with teenagers having the highest rating. Fewer than 2 percent of the membership had experienced divorce or separation. Some 85 percent considered sexual intercourse before marriage as always wrong. The early emphasis on church-world dualism, pacifism, not taking oaths, and church discipline was affirmed by a range of from 60 to 80 percent, depending upon the conference.

This religious stance is nurtured through worship, attendance at denominational schools, devotional practices, small-group Bible study, and involvement in mission and service projects. Church buildings are generally functional and relatively austere. Worship services are usually sermon-centered. Most congregations enjoy singing, often a cappella. The Lord's Supper is celebrated two to four times annually. Some congregations practice the rite of foot washing.

Numerous liberal arts colleges are maintained in North America; they were established originally to train workers for church vocations. Seminaries, Bible schools, secondary schools, and other church institutions are maintained by Mennonites around the world as political and economic conditions permit. Retirement centers, community mental health centers, and medical and disaster aid services are maintained particularly in North America and Europe. The concern for united help for needy people around the world

led to organization of the Mennonite Central Committee (MCC) in North America in 1920. A Dutch Mennonite relief agency had been organized two hundred years earlier. In 2003, the MCC had a cash and material aid budget in excess of \$62 million, spent on projects both abroad and in North America. In the same year, about 1400 long-term and over 800 short-term workers were involved in projects in over sixty countries.

These activities are a direct extension of the Mennonite conviction that word and deed must be one and that love must be visible. It may, however, also be that these and related activities serve the less altruistic function of legitimizing the social significance and usefulness of a traditionally pacifist and persecuted people. Nevertheless, most Mennonites are deeply concerned about the futility of war and nuclear weapons, as well as about global poverty and the need for peaceful steps toward economic and social justice. These concerns are part of the total global mission to which Mennonites continue to feel committed.

CORNELIUS J. DYCK (1987)
Revised Bibliography

MEN'S STUDIES IN RELIGION is part of the unfolding concern within religion to address the effects of gender and sexuality upon religious faith and practice. As a new field of scholarly inquiry, it reflects upon and analyzes the complex connections between men and religion, building upon gender studies, feminist theory and criticism, the men's movement, and the increasing number of subdisciplines in the academic study of religion. Methodologically men's studies in religion is an open field; its object of inquiry is

“men” as gendered beings in relation to religion. But the precise delineations of this inquiry are not yet determined. Distinctions between the academic study of men in religion, on the one hand, and affirmation of socially accepted forms of male religiosity, on the other, are not always drawn with sufficient clarity.

The compelling simplification that this new field is constituted by “men writing about religion” is misleading because it does not recognize that the sphere of the sacred has been traditionally male-centered and male-dominated. In many religions, religious norms and male experiences are indistinguishable, making men the beneficiaries of religiously sanctioned hierarchies. The task of men’s studies in religion is to bring gender consciousness to the interpretation and analysis of men in relation to any aspect of religion. Simply put, the writing of a religious man is not the same as the scholarly study of a male author’s gendered text and context.

Studies in this new field are, on the one hand, critical of normative models of masculinities and, on the other, also supportive of men struggling to find their place in religion and society. These studies may examine male religious authority, analyze societal attitudes toward men, or study religious practices that enforce gender norms. They may probe theologies that justify patriarchal hierarchies or investigate men’s participation in religiously sanctified oppression. They may also suggest alternative devotional and spiritual practices for men and reenvision men’s roles as caregivers in both the profane and sacred realms.

HISTORICAL PRECEDENTS. A trajectory can be identified from secular feminism to the current concerns of men’s studies in religion. Feminists of the 1960s and 1970s drew attention to the devastating effects of patriarchy and heterosexism in Western culture. Their analyses deeply influenced women scholars of Christianity and Judaism so that by the 1980s feminist interpretations of Scripture and theology had become part of the theological norm. Also in the 1980s men outside religion began to respond to the feminist critique of patriarchy and to study the effects of hegemonic masculinity upon men themselves, drawing particularly on the fields of sociology, anthropology, and psychology.

Within the field of religion, in response to secular feminism, religious feminism, secular men’s studies, and the rise of the gay liberation movement, gay men’s issues in religion began to be addressed in the 1980s. One of the early controversial academic works was John Boswell’s *Christianity, Social Tolerance, and Homosexuality* (1980). By 1988 gay men’s issues in religion became a recognized group within the large, North American–based organization of the American Academy of Religion (AAR). Finally, in the 1990s men’s studies in religion emerged as a field in its own right at the AAR. Stephen Boyd’s “Domination as Punishment: Men’s Studies and Religion,” published in *Men’s Studies Review* (1990), was probably the first public articulation of the need for such an inquiry, arguing that “in light of recent research in and theo-

ries of men’s studies, the relationship between religion and male experiences” must be examined (Boyd, 1990, pp. 8–9).

Generally speaking, there is a difference between the men’s movement (secular and religious) and the academic study of men in religion. Whereas the former tends to favor biological, essentialist, and archetypal models, the latter tends to see men as culturally constructed, gendered, and performing contradictory roles due to constantly changing ideologies of masculinity. Men’s studies in religion then analyzes and understands “the role of religion in supporting or resisting unstable masculine identities” (Boyd et al., 1996, p. 286). The following trends within the field can be observed.

MEN RECLAIMING RELIGION AND FAITH. In the twentieth century the mythopoetic movement and various conservative men’s movements have attempted to reclaim spirituality and faith-based attitudes toward male identity and toward larger social issues, such as family values. These movements can be viewed as essentialist responses to a perceived threat of feminism.

Mythopoetics is based on the archetypal theories of C. G. Jung, James Hillman, and Joseph Campbell. It was made popular outside Christian churches by Robert Moore and Douglas Gillette’s *King, Warrior, Magician, Lover* (1990) and remained relatively marginalized in Christian communities until the writings by Robert Bly and John Gray. The mythopoetic movement generally assumes that biological and genetic differences between men and women preordain irreconcilable differences in gendered behavior and thought, often presuming an essential masculinity that can be threatened when men become too much like women. In response men need to be nurtured socially, religiously, and spiritually in ways that match their masculine nature, generally with a preference for male images of the divine.

Evangelical Christian men’s movements arose in the nineteenth and twentieth centuries in the Western world out of the panic that women were moving into the sphere of the sacred and were taking over religious institutions. The first such development in the first half of the nineteenth century was known as Muscular Christianity. It was followed by the Freethought movement (1880–1920), which characterized Christian churches as feminized, numerically dominated by women, and therefore weak, sentimental, and irrational. The third development, the Men and Religion Forward movement (from about World War I through to the 1950s), coined the slogan “More Men for Religion, More Religion for Men.” The fourth movement was spearheaded by the evangelist Billy Sunday, who uttered the famous statement at a sermon in Chicago in 1916: “Lord save us from off-handed, flabby-cheeked, brittle-boned, weak-kneed, thin-skinned, pliable, plastic, spineless, effeminate, ossified three-karat Christianity” (“Sunday, the Fighting Saint,” *Trenton Evening Times*, January 6, 1916). Finally, in the 1990s two prominent movements emerged in the United States that strengthened the faith of their male constituencies: the

Promise Keepers, intended to draw men back to Christianity, and the Million Man March, organized in 1995 by the Nation of Islam leader Louis Farrakhan, that mobilized African American men to commit themselves to religiously based values. Both argued for man's rightful position as head of the family.

SPIRITUAL AND CONFESSIONAL WRITINGS. The religious traditions have accumulated a wealth of spiritual journals and autobiographies, mystical journeys, and confessional testimonies written by men. They constitute a vast source for examining individual as well as collective presentations of the male self. Bringing a gender-conscious perspective to these texts yields critical insights into the male psyche and forms of male embodiment, intimacy, and sexualities.

The literature reflecting on men's spiritual and autobiographical voices often blends scholarly analysis with a more personal and existential style. The borders between critical analysis and an envisioned spiritual renewal are intentionally porous. Areas of concern in the Jewish and Christian traditions are issues of embodiment, sexual theologies, and the deconstruction of traditional masculine roles. The male body is reclaimed as a positive part of a male religious identity, so that the threats of impotence, disease, aging, mortality, and homophobia are turned into valuable spiritual resources. Rather than denigrating men's sexual nature, the sexual body is demystified and understood as an important source of theologies of intimacy and friendship with humans and the divine. These writings usually shun the privileging of hegemonic masculinity in order to engage otherness in the form of race, class, and sexual orientation. Particularly they counter the crippling effects of homophobia and abusive behavior toward women as well as culturally or sexually marginalized men. Instead, new forms of masculine spirituality are located in relationality, shared power, the aesthetics of the male and female body, creativity, ritual, and the living out of social justice through quiet service.

Another aspect of men's studies in religion is to reflect critically on confessional modes of male discourses on religion. Still an underutilized approach, most of this work is located within the Christian tradition, largely due to the lasting influence of Augustine's (354–430 CE) *Confessions* and the thought of the French philosopher Michel Foucault (1926–1984). In his *History of Sexuality* (1978) and "The Battle for Chastity" (1982), Foucault mapped out an influential theory about the Christian monastic roots of the modern concern over sexual practices, desires, and politics. The monastic orders, especially as envisioned by John Cassian (360s–430s CE), created intimate male-male spaces for the confession of sins that developed into "very complex techniques of self-analysis" (Foucault, 1982, p. 195). A Foucaultian framework helps analyze religious men's desire for intimate self-revelations; at the same time it can be used to investigate both subjugated and liberating knowledge of male sexualities as revealed in confessional, spiritual, and autobiographical writings.

THEOLOGICAL AND BIBLICAL INVESTIGATIONS. Men's studies in religion investigates the scriptural traditions as well as the Christian and Jewish theological heritages. Boyd (1995) identifies six cultural barriers that prevent white Christian men from enjoying true intimacy with the multiplicity of God's creation: classism, anti-Semitism, racism, homophobia, sexism, and femiphobia. This list can be completed by adding men's obsession with work as a source of identity, disappointments with biological fathers (and by extension with monotheistic father gods), tolerance of violence, body unconsciousness, and emotional deadness. By accepting such restrictive constructions of masculinity, men inhibit themselves from living into their potential of a creatively embodied *imago Dei*.

A number of writers interact critically with Christian thinkers such as Augustine, Martin Luther, Dietrich Bonhoeffer, Matthew Fox, Alfred North Whitehead, Richard Niebuhr, Malcolm X, Desmond Tutu, and Howard Thurman. Other writers focus more on the psychology of male characters in the biblical Scriptures, highlighting the problems of contemporary men struggling with relationship and identity issues. Christian writers in this field generally focus on Jesus, Jewish writers on God and the rabbinic tradition when addressing such issues as boyhood and parenting, friendship and intimacy, community and accountability, and the experiential dimension of the male body, pain, and sacrifice.

Another trend in men's studies in religion is to examine how Christianity and Judaism have framed the discourse on masculine ideologies, especially in their formative periods of late antiquity. Following feminist scholars, who have reconstructed the complexity of religious women's lives, new studies show that notions of masculinity were far from stable in the culturally diverse Hellenistic world. During the waning of the Roman Empire and the rise of new religions (Catholicism in the West, Orthodoxy in the East, Rabbinic Judaism in the exilic communities, and eventually Islam), male identities had become fragile and contested, even among the educated upper-class men who were still the beneficiaries of male privileges. As inconsistencies grew between ancient ideals and new social realities, Jewish and Christian men began to redefine male sexuality and manly virtues. Christianity succeeded in replacing the Roman ideas of vigor and military strength with the virtues of a spiritual strength and sexual constraint.

While scholars of masculinity in early Christianity and late antiquity have stressed the rapid rise of a subordinate ideology of manliness to dominant status, Jewish scholarship has described rabbinic masculinity as subjected to and colonized by first the Roman then Christian supremacy. Talmudic discussions of what it means to be or to become a man differed greatly from the theologies of the Christian Church Fathers, not at least due to their profoundly different assessments of male celibacy. But both Jewish and Christian discourses converged on the issue of the male desire to be close

to God. Positioning themselves as symbolic “woman” in relation to a (male) God, men excluded actual women from the sacred sphere. To hide the homosocial and homoerotic nature of this relation to the divine, they inscribed heterosexual norms by effeminizing subordinate and disloyal men. In Christianity the desire for male humility was a gesture of submissiveness toward God, not women. In Rabbinic Judaism, Jewish men saw themselves figuratively in the place of woman in the presence of God. Torah study itself became a highly eroticized passion from which (actual) women were excluded. Although the feminization of Jewish men is one of the enduring anti-Semitic stereotypes in Christianity, one scholar has suggested embracing “the feminized Jewish male” as an act of resistance to dominant Christian masculinities (Boyarin, 1997, p. xiv).

The debate about male-divine relations is echoed in a number of writings about the theological conundrum that both Christianity and Judaism posit a God who is ungendered and unsexed. How do men reconcile a craving for a male God when hegemonic masculinity demands that desire be felt and expressed (or denied) only between men and women? The monotheistic traditions offer no clear models for such homosocial desire. Judaism sees penile circumcision as a theological and covenantal act of mature obedience, while Christianity offers a more metaphorical interpretation: the circumcision of the heart. Neither religion answers the question about whether circumcision is a part of the *imago Dei* or an act of male violence toward males.

GAY AND QUEER STUDIES IN RELIGION. Gay men’s religious studies have generally developed separately from men’s studies in religion despite some significant overlap. Gay studies challenge hetero-normativity by focusing on diversity, pride, and liberation. Some writers understand gay spirituality as a theology from the margins, defining itself by difference, otherness, and intimacy. Sexuality is often conceived as an act of sacramental Eros and gay spirituality as an act of political protest. Gay men’s studies walk a fine line between mainstream integration and resistance to Christian scriptural and theological heterosexism. They may focus on mapping out gay spirituality, developing theodicies on AIDS, or criticizing the attitudes of religious institutions toward homosexual clergy and faithful laity.

The work of the British clergyman and poet Edward Carpenter (1844–1926), a gay theologian of the early modern period, was not really built upon until after three disasters hit the international gay community: the trial of Oscar Wilde (1895), the Nazi extermination of gay men in the concentration camps (1940–1944), and the Stonewall riots in New York City (1969). In the early 1980s the theologian James Nelson may have been the first nongay in the men’s movement to adamantly oppose double standards in sexual ethics that separate straight and gay. Others have divided gay men’s spirituality into four types: the apologetic (the reasoned defense of homosexuality), the therapeutic (“coming-out” as a spiritual journey), the ecological (emphasizing liber-

ation theology and right relation), and the autobiographical (Boisvert, 2000). This typology must be expanded to include the growing repertoire of transgressive and queer theologies and spiritualities. In general gay spirituality is earthed, embodied, daily mundane, and informed by feminist and Native American spiritualities.

Just as there are no fixed demarcations between men’s and gay men’s studies in religion, gay studies overlap in multiple ways with queer theory. Queer theory, which made its public debut in 1990, is less concerned about the same-sex orientation of men but instead focuses on sexualities in their multitudes. Queer theory questions any theoretical or practical system that claims sexuality as natural or biological categories, and it moves beyond the binary restrictions of men and women, of hetero- and homosexuality. Queer theory refuses hetero-normativity because it “recognizes that human desire . . . is queer, excessive, not teleological or natural” (Boyarin, 1997, p. 14). Scholarship on queer theory that engages issues of religion and masculinity includes biblical studies, Jewish studies on masculinity, and queer theology (the latter defined as a political theology that questions theological assumptions about sexuality).

OUTLOOK. Men’s studies in religion as an emerging field of inquiry is still heavily located within the scholarly traditions of the West, specifically Christianity and Judaism. It has not yet sufficiently engaged other religious traditions and been tested seriously as a topic of interreligious dialogue within an increasingly globalized community. Men’s studies in religion has the potential to offer a sustained, gender-conscious critique of foundational religious texts and practices in order to envision nonhegemonic models of masculinity and to allow all men and women to participate in religious life fully and equally.

- Moore, Stephen D. *God's Beauty Parlor: And Other Queer Spaces in and around the Bible*. Stanford, Calif., 2001. Written from the perspective of a New Testament scholar, this book brings queer theory and masculinity studies into conversation with biblical studies. It is critical commentary and cultural interpretation of select biblical texts and theologies, addressing issues of sexuality, violence, homoeroticism, and ideologies of beauty and of masculinity.
- Nelson, James B. *Between Two Gardens: Reflections on Sexuality and Religious Experience*. New York, 1983. One of the earliest books to examine the relationship between human sexuality and Christian experience, the author asks what sexuality says about faith. He argues for the liberation of men from the gender assumptions of traditional Christianity and exposes Christian hypocrisy in holding out conflicting standards for heterosexual and homosexual men.
- Nelson, James B. *The Intimate Connection: Male Sexuality, Masculine Spirituality*. Philadelphia, 1988. Seeking to promote

“whole men” as opposed to “real men,” Nelson discusses the human need for intimacy and sensuousness. He asks why men have trouble establishing deep friendships and how God’s transforming love can work among men who take risks. In particular this book is known for offering a healthy spirituality of male genital desire.

BJÖRN KRONDORFER (2005)

PHILIP CULBERTSON (2005)

MENSTRUATION. It is questionable whether late-modern scientific, detraditionalized Western societies can still be said to institute a menstrual taboo. Today in westernized cultures, menstrual blood is more likely to be considered a bodily waste product whose disposal is more a matter of hygiene and social etiquette than a threat to the cultic order. However, the contemporary world is only partially and unevenly secularized, and the role and status of women in the world’s religions cannot be fully understood without reference to the negative powers generally ascribed to menstrual blood. And more than that, while menstrual taboos vary in practice and intensity in the world’s religious cultures, menstruation remains central to the construction of female difference.

Where early anthropologists and historians of religion claimed that menstrual taboo was universal, more recently Thomas Buckley and Alma Gottlieb (1988) have argued that the Western repugnance for menstrual blood and Western cultural alienation from female biological processes have been projected onto the interpretation of indigenous menstrual practices. The power of menstrual blood may not, in fact, be universally regarded as negative, but sometimes as positive and, if handled with due care, life-giving. Indeed, menstruation, and especially menarche (the onset of menstruation) can for North American Indians, such as the Sioux, confer honor and power on a woman rather than stigmatize her.

Nonetheless, in both historical and contemporary practice, the major world religions share an overwhelmingly negative view of menstruation as a pollutant of sacred public and domestic space, which requires some form of separation of the menstruant from the family or community. Menstrual blood is a contact pollutant and excludes women from religious acts either during their menstruation or simply because they are persons who menstruate. These exclusions owe much to the symbolic and material ambivalence of menstrual blood. On the one hand, it is a defiling natural excretion whose cyclic flow is not susceptible to (masculine) cultural control. Menstrual blood actually and metaphorically represents the loss or abortion of a potential life, yet it causes a woman no painful threat to her life. On the other hand, menstrual blood belongs to the mysterious, quasi-divine processes of creation: the gestation and birth of a new life.

MENSTRUATION IN THE WORLD RELIGIONS. Given the complexity of religious traditions, the following remarks are

necessarily very general and may not pertain to all forms of a specific religion. Nonetheless, it is broadly the case that in Brahmanical Hinduism, menstrual blood is considered polluting and requires a woman to separate from her family for the first three days of her period. During this time she cannot perform religious acts of devotion and, secluded from her family, cannot cook, look after children, brush her hair, or wear jewelry. She must perform a purificatory bathing rite before normal relationships and activities can resume.

Similarly, in Buddhism, menstrual pollution prevents a woman from undertaking pilgrimage or entering a temple. The prohibitions differ according to context: some temples in northern Thailand do not allow women to circumambulate the stupas, fearing the pollution of relics held at their center. However, contemporary Buddhist apologetics frequently disown the menstrual taboo as non-Buddhist and as originating in the older purity codes of host countries such as India and Japan.

In the Qur’anic view (2:223), menstruation is polluting and requires the Muslim woman’s seclusion from her husband. The *hadith* literature prohibits a menstruant from reciting prayers, fasting, entering a mosque, and touching the Qur’an until she has finished her menses and taken a full bath (*ghusl*). This purification ritual allows her to resume sexual relations with her husband. There are, however, some notable variations in practice: the Khārājīs, for example, believe that a menstruant should continue to fast and pray.

In Judaism, the menstrual taboo derives from the priestly codes of the Hebrew Bible and from rabbinic law. After Judaism’s post-biblical transformation from a religion of cultic sacrifice to one of law, the rabbis reinforced the injunctions of *Leviticus* 12:1–5 and 15:19–32 by ruling that a menstruant is impure for the five or so days of her menses and for at least seven days afterwards. After this time has elapsed, the menstruant (*niddah*) visits a ritual bath (*miqveh*) and, after immersion, physical relations with her husband can be resumed. However, the power of menstrual blood to defile Jewish sacred objects and spaces is limited: the touch of a menstruant cannot pollute the Torah scroll, and menstruating women are not excluded by law, though sometimes historically by custom, from the synagogue. Only the ultra-Orthodox are punctilious in observing the laws of menstruation (customarily termed “the laws of family purity”), but the contemporary apologetic emphasis is on the laws’ alleviation of sexual boredom in marriage, rather than on a superstitious or cultic repugnance for menstrual blood as such. Conservative Judaism has modified the laws of menstrual purity, and Reform Judaism has abolished them as irrelevant, archaic, and offensive to women.

The Christian tradition is historically and denominationally diverse in its view of menstruation. In the New Testament, Jesus is presented as having abolished the Jewish menstrual taboo among other distinctions between the clean and the unclean. Most significantly, in a story found in all three synoptic Gospels, Jesus heals the menstrual disorder of

a woman whose touch he experiences not as a defilement but as a mark of her faith. Nonetheless, Christian feminists have argued that, as the church developed, a legacy of Greek philosophical misogyny, ancient Mediterranean menstrual superstition, Gnostic asceticism, the institution of a celibate priesthood, and the authority of the Old Testament combined to reinstate the view of menstrual blood as unclean. To this day, the Christian menstrual taboo informs the disqualification of women from ordination because in most quarters of the church (notably the Orthodox and Catholic Churches) it is believed, if not always stated, that a woman's biological presence pollutes the sanctuary.

By contrast, the menstrual taboo would appear to have fallen into disuse in the contemporary Protestant denominations. In the Anglican Church, for example, the practice of churching (derived from *Leviticus* 12:2–8), where a woman undergoes a purification ritual forty days after she has given birth to mark her return to the community, is no longer observed. Whether Protestantism's apparent indifference to women's menstruality is a function of its egalitarian, word-centered, and anti-priestly ecclesiology, or whether it is ignored because it is considered socially unmentionable, remains a matter of debate.

FEMINIST SUBVERSIONS OF THE MENSTRUAL TABOO. From the mid-1970s to the 1990s, a number of influential feminist studies of menstruation were published in which Jewish, Christian, and Goddess feminists critiqued, subverted, and reclaimed the menstrual taboo, broadly construing its various forms as the fear, appropriation, and regulation of women's sacral power. Two central arguments were proposed. First, it was observed that the gendering of blood underpins gendered inequalities of religio-political power. That is, whereas the cultural, controlled flow of the blood of male animals spilled in the Israelite Temple cult in the covenantal circumcision of Jewish boys—and the sacrificial passion and crucifixion of Jesus—reunited the world and God, the natural cyclic flow of female blood has separated them, leaving female time, space, and bodies unfit for direct contact with the divine presence or its revelation. Second, it has been noted that if menstrual blood is, as it were, repulsive of divine presence, then that has left women historically vulnerable to unjust charges of unreason and maleficence.

While some religious feminists find menstrual taboos distasteful and irrelevant, others have interpreted the apparent reverence of some of the world's pagan traditions for menstrual blood as suggestive of a more ecological and feminist approach to religion and spirituality. The anthropology of indigenous ritual seclusion practices has been read selectively to suggest ways for menstruating women to gather together in rest and friendship to celebrate the female transformation mysteries. In these, as in some Jewish feminist circles, menstruation is experienced as a time of creative energy rather than lassitude and depression; daughters' menarches are celebrated as affirmatory rites of passage into womanhood, and menopause is marked by rituals that allow women to re-

flect with other women on their passage through time into greater wisdom and independence. Rejecting, then, the demystifying secular feminist view of menstruation as what Germaine Greer once called the "liquidification of abjection," these spiritual feminists have together produced a new menstrual praxis that celebrates the connections of menstrual flow to the phases of the moon and the tides. Spiritual feminists have reclaimed the magic-natural charge of menstruation and put it to regenerative ends, sometimes using menstrual blood in rituals, and they have ritualized political direct action to protest the masculine wasting or spilling of blood in war.

MELISSA RAPHAEL (2005)

MERCIER, DÉSIÉ JOSÉPH (1851–1926), a leading figure in Roman Catholic neoscholastic philosophy at the end of the nineteenth century and Cardinal Primate of Belgium (1906–1926). Born November 21, 1851, in Braine-l'Alleud, near Waterloo, Mercier studied philosophy and theology at Malines and earned a licentiate in theology at Louvain University (1877). Subsequently, he studied psychiatry in Paris.

Ordained a Roman Catholic priest in 1874, Mercier became a staunch supporter of Pope Leo XIII's call for a revival of Thomistic thought in the encyclical *Aeterni patris* (1879). Initially a professor of philosophy at the Malines seminary in 1877, Mercier then became the first holder of a new chair for Thomist philosophy at Louvain University in 1882. He soon sought papal approbation for a new institute at Louvain, and in 1889 Leo XIII approved the Institut Supérieur de Philosophie with Mercier at its head. Calling former students together from around the globe, he assembled an international group of disciples.

Working in opposition to Mill's positivism, and above all to neo-Kantian idealism, Mercier became a major figure in the development of Roman Catholic neoscholastic thought, which sought to mediate between modern natural science and traditional Thomistic metaphysics. While neoscholastic thought of the nineteenth century was concerned mainly with questions of epistemology and the soul-body relationship and locked its responses to these problems into a rigid anti-Kantian tradition, Mercier strove to make Thomistic philosophy dependent upon the thought of his time: to see the "new" in the "old." His main area of concentration was psychology, and in 1892 he founded the first experimental laboratory at his institute in that discipline; later laboratories, emphasizing his regard for experimental methods, followed in cosmology, chemistry, and physics.

In contrast to most Roman Catholic thinkers of his time, Mercier saw philosophy as distinct from theology, and above all as an enterprise that should be free of all apologetics. Without abandoning all tradition, he sought to imbue philosophy with the same ethic of investigation that marked other university disciplines; philosophy must address the people, their times, and their problems. Even when dealing with such questions as truth and certitude, Mercier appealed to human experience. This led to his system of "illationism," which admitted that truth and certitude came from intellectual reflection, but that the content of such abstract thought always had its origins in concrete experience. Though this direction produced much controversy in neoscholastic circles, it was unable to sustain itself as a "school" at Louvain Uni-

versity. Mercier gave expression to his thought in a series of textbooks (his *Course in Philosophy*) that dealt with logic, psychology, metaphysics, and the criteria for truth and certitude (1892–1899). In addition, he founded the influential *Revue néo-scholastique de philosophie* (1894), in which many of the movement's most important debates were carried out.

Appointed archbishop of Malines in 1906, Mercier was created a cardinal by Pius X in 1907. Though never a leading figure in the controversy of modernism that rocked the Roman Catholic church at the beginning of the twentieth century, he did issue a famous Lenten pastoral letter in 1908 against the work of George Tyrrell (1861–1909), a prominent Irish modernist thinker; his letter prompted a vitriolic but brilliant rejoinder by Tyrrell in his *Medievalism* (1908). As a pastorally concerned leader of his diocese, Mercier was deeply involved in the spiritual life and development of both his clergy and the laity; indeed, he sought greater cooperation between both groups as well as advances in social justice. Though Mercier never became a strong political figure in Belgium—his attachment to French culture hindered his understanding of the Flemish and their problems—he did become a figurehead for the Belgian people during the German occupation of World War I (1914–1918), strengthening their morale through sermons and pastoral letters. This proved so effective that the Germans placed him under house arrest, which earned him great prestige among the Belgian people and much praise from the Allies after the war.

Mercier's final years after World War I were dedicated to more universal problems, particularly those of church reunion. He founded the Institute of the Monks of Union at Chevetogne in Belgium in order to further reunion and reconciliation with the Eastern churches and made perhaps his most influential and lasting effort in hosting and participating in the famous "Malines Conversations" (1921–1925). Suggested by Lord Halifax (Charles Lindley Wood, 1839–1934), these meetings were concerned with aiding the mutual understanding and relations between the Roman Catholic and Anglican churches. Mercier's most famous moment came in the fourth session when he presented his paper on "The English Church United Not Absorbed," in which he proposed that the archbishopric of Canterbury be made a patriarchate, that the Roman code of canon law not be imposed in England, that England be allowed its own liturgy, and that all of the historical English sees be left in place while the newly erected Roman Catholic sees (1850) be suppressed. These suggestions generated much controversy and opposition in Rome, and Mercier's death on January 26, 1926, in Brussels effectively meant the end of the "Conversations."

BIBLIOGRAPHY

Works by Mercier

Mercier's main work, the *Cours de philosophie*, 4 vols. (Louvain, 1894–1899): vol. 1, *Logique* (1894); vol. 2, *Métaphysique générale, ou Ontologie* (1894); vol. 3, *La psychologie* (1899); and vol. 4, *Critériologie générale, ou Théorie générale de la certitude* (1899), represented his sequence of philosophy courses

given at the Higher Institute for Philosophy at the University of Louvain. Many of Mercier's writings and public utterances were collected in the *Ceuvres pastorales* (Brussels and Louvain, 1911–1929), in seven volumes. Finally, his famous exchange of letters with the commandant of the German occupation forces during World War I appeared as *La correspondance de S. E. cardinal Mercier avec le gouvernement général allemand pendant l'occupation, 1914–1918*, edited by Fernand Mayence (Brussels, 1919); in English translation as *Cardinal Mercier's Own Story* (New York, 1920). The most complete bibliography of Mercier's published writings should be consulted in the commemorative volume *Le cardinal Mercier, 1851–1926* (Brussels, 1927), pp. 341–372.

Works about Mercier

Of the several biographies of Mercier, one may profitably consult John A. Gade's *The Life of Cardinal Mercier* (New York, 1934). A full-scale and scholarly biography of Mercier, taking advantage of the many particular studies that have appeared since his death, and which would place him more accurately in the troubled and multifaceted context of his time, still must be written. Among the most important of these investigations are Alois Simon's major studies, particularly *Le cardinal Mercier* (Brussels, 1960), which provide an assessment of Mercier's contributions both to renewed scholasticism and the general philosophical conversation at the turn of the century in Europe. For new information concerning Mercier's ecumenical activities, one should consult Roger Aubert's "Les conversations de Malines: Le cardinal Mercier et le Saint-Siège," *Bulletin de l'Académie Royale de Belgique* 53 (1967): 87–159; and R. J. Lahey's "The Origins and Approval of the Malines Conversations," *Church History* 43 (September 1974): 366–384.

GARY LEASE (1987)

MEREZHKOVSII, DMITRII (1865–1941), chief proselytizer of the religious renaissance in Russia in the early twentieth century. Scion of an eminent Saint Petersburg aristocratic family, Merezhkovskii was educated at the Third Classical Gymnasium and at the Historical-Philological Faculty of the University of Saint Petersburg (1884–1888). Interested in metaphysical and existential issues, he dissented from the positivism and materialism of his contemporaries and searched, all his life, for a new and all-encompassing higher ideal.

In the 1890s, he championed mystical idealism as the bridge between the atheistic intelligentsia and the believing peasantry, campaigned against mandatory social didacticism in literature, introduced Russians to French symbolism and the philosophy of Nietzsche, and reintroduced them to classical antiquity and the Renaissance. Versatile and erudite, he expressed his ideas in poetry, literary criticism, essays, novels, and plays. Major works of this period are *Symbols* (1892), a book of poems; "On the Causes of the Decline of Russian Literature and on the New Trends in Poetry" (1893), an influential essay sometimes considered the manifesto of Russian symbolism; *New Verse* (1896); and *The Outcaste* (1895),

later retitled *Death of the Gods*, a historical novel about Julian the Apostate. Attracted by pagan values of earthly happiness and Christian ideals of personal immortality and love, and unable to choose between them, by 1896 Merezhkovskii had concluded that Christianity and paganism were two halves of a yet unknown higher truth.

Around 1900, Merezhkovskii advanced a new interpretation of Christianity, designed to synthesize the "truth of heaven" and the "truth of the earth," and based on the second coming of Christ and on a forthcoming third testament. Proclaiming a new religious consciousness that stressed the human need for faith and religious quest, he dismissed historical Christianity as obsolete and rejected the asceticism, altruism, and humility preached by Russian Orthodox Christianity. Major works of this period include *Tolstoy as Man and Artist with an Essay on Dostoevskii* (1901–1902), which treats these writers as exemplars of the religious principles of the flesh and the spirit respectively; *Birth of the Gods: Leonardo da Vinci* (1901); and *Antichrist: Peter and Alexis* (1905). Together with *Julian the Apostate*, the last two comprise his historical trilogy, *Christ and Antichrist*.

To disseminate their views (sometimes called "God-seeking views"), Merezhkovskii, his wife Zinaida Gippius, and Dmitrii Filosofov founded the Religious Philosophical Society of Saint Petersburg (November 1901–April 1903). The society, which featured debates between intellectuals and clergymen on burning issues of the day, became a focal point of the religious renaissance. The minutes of the meetings were published in the Merezhkovskii's review, *Novyi put'* (New Path, 1902–1904), founded as a showcase for the new trends in art and thought. Permitted to reopen in 1907, after the Revolution of 1905, branches of the society were later founded in Moscow and in Kiev. Through these public activities and through his writings, Merezhkovskii's ideas reached a wide audience, challenged traditional verities, inspired other reinterpretations of Christianity, and even stimulated the Bolshevik secular religion of "God-building," which featured worship of the collective spirit of humanity instead of God.

The Revolution of 1905 led Merezhkovskii to consider social and political questions. He interpreted it as the first stage of a great religious revolution that would usher in the kingdom of God on earth. He denounced autocracy as a tool of the Antichrist, and advocated religious community, viewed as a kind of Christian anarchism, as the solution to social conflict. Hostile to Marxist materialism and collectivism, he claimed that socialism stifles creativity and argued that Jesus Christ is the supreme affirmation of the individual. Major works of this period are *Dostoevskii: Prophet of the Russian Revolution* (1906), *The Coming Ham* (1906), and *Not Peace but a Sword* (1908). He opposed Russia's entry into World War I, welcomed the February Revolution, but regarded the Bolshevik regime as the reign of the Antichrist. He cooperated with attempts to overthrow it, both before and after his emigration in 1919, until his death in Paris, in 1941.

BIBLIOGRAPHY

Most of Merezhkovskii's important works can be found in *Polnoe sobranie sochinenii*, 24 vols. (Saint Petersburg, 1911–1914). Works in English translation include *Death of the Gods* (London, 1901), *The Romance of Leonardo da Vinci* (London, 1902), *Peter and Alexis* (London, 1905), *The Menace of the Mob* (New York, 1921), and an abridged version of *Tolstoi as Man and Artist* (Westminster, England, 1902). Useful secondary literature includes my own *D. S. Merezhkovsky and the Silver Age* (The Hague, 1975); Charles H. Bedford's *The Seeker: D. S. Merezhkovskiy* (Lawrence, Kans., 1975); *D. S. Merezhkovskii: Mysl' i slovo* (D. S. Merezhkovskii, Thought and word), edited by A. V. Keldysh, I. V. Koretskaia, M. A. Nikitina, and N. V. Koroleva (Moscow, 1999); and *D. S. Mereshkovskii: pro et contra*, edited by D. K. Burlak et al. (St. Petersburg, 2001).

AN OVERVIEW
BUDDHIST CONCEPTS
CHRISTIAN CONCEPTS

MERIT: AN OVERVIEW

The terms *merit* and *merit making* are used in connection with religious practices that have the calculated aim of improving the future spiritual welfare of oneself or others. However, the number of contexts in which a specific terminology such as *merit* (Lat., *meritum*) or its older analogue, the Buddhist *punya* (Pali, *puñña*) has developed are surprisingly few. It is probably for this reason that most well-known systematic or phenomenological studies of religion have little or nothing to say on the subject. Elsewhere, the use of these terms in writing on religion is widespread but extremely sporadic, occurring mainly in discussions of generally related subjects such as judgment, reward and punishment, grace, and salvation.

In religion west of India, the earliest specific teaching on merit, or merits, is found in rabbinic Judaism, although merit was not the subject of formal definitions. From the third century CE, the concept played an increasingly significant role in Western Christianity; it reached a high point in the Middle Ages, only to be drawn into the vortex of Reformation debate on grace and the relation between works, faith, and man's justification in the sight of God.

Recent years have seen a smooth and indeed justifiable transfer of the English term *merit* (as well as of European equivalents such as the German *Verdienst*) to that area of Buddhist practice and interpretation covered by the Sanskrit term *punya* and its equivalents. The term *merit making* implies an observational, analytic stance not usually found in studies of merit in Christianity, which have been more doctrinal or theological in tone. Nevertheless, interesting parallels can be drawn between Buddhism and Christianity as re-

gards merit. Elsewhere, the relationships are much less clear, and comparative questions have to be suggested much more loosely insofar as they are relevant at all. The following observations should be understood as indicating the general context in which specific teachings on merit have arisen in rabbinic Judaism, Buddhism, and Christianity.

INDIA AND CHINA. That religious action has practical effects in this existence and others has been widely assumed in the religious systems of Asia, though with many variations. In the Indian context, the common assumption of post-Vedic religion is that of a series of existences, each conditioned by the *karman*, or accrued causal momentum, of the previous existence. Since *karman* can be either bad or good, there is room for improvement through religious practice or moral effort. Thus, loose analogies exist with other religious teachings on reward and punishment, religious works, and spiritual development. The main characteristic of Indian assumptions on the subject, whether Hindu, Jain, or Buddhist, is that karmic cause and effect are in principle self-regulating, not subject to divine decision, arbitration, or satisfaction.

In Jainism, seven "fields of merit" (*punya* *aksetra*) are recognized as conducive to a pleasantly advanced rebirth. These have been presented by Padmanabh S. Jaini in *The Jaina Path of Purification* (Berkeley, 1979) as seven categories of meritorious activity: donating an image, donating a building to house an image, having the scriptures copied, giving alms to monks, giving alms to nuns, assisting laymen in their religious or practical needs, assisting laywomen similarly. The concept of *karman* should not in itself, however, be regarded as amounting to a doctrine of merit. This would push the analogy beyond its limits.

In Chinese religion, two relevant strands are discernible. First, there is the tradition of self-discipline and cultivation, in Confucian form oriented socially and pragmatically, in Daoist form linked to the achievement of supernormal powers, longevity, and even immortality. The idea of achieving supernormal physical and psychical powers through strenuous self-discipline is also present in Indian religions, including Buddhism, and hence in all cultural areas influenced by China and India. At the same time, this motivation for religious practice and achievement is not directly related to any concept analogous to merit.

Second, Chinese religion also knows the theme of post-mortem judgment, presided over by Yen-lo (counterpart of the Indian god Yama) as god of death and ruler of the hells. Aided by his assistants, Yen-lo brings out the inexorable law of *karman*, and many illustrated works depict this as a warning to the living. (See, for example, the illustrated volumes *Religiöse Malerei aus Taiwan: Katalog* and *Die Höllentexte*, publications 1 and 2 of the Religionskundliche Sammlung der Philipps-Universität Marburg, 1980, 1981.) Religious imagery of this kind, though clearly related, does not entail a distinct doctrine of merit except insofar as it is influenced by Buddhism.

EGYPT AND ANCIENT NEAR EAST. In ancient Egypt, the diffusion of the cult of Osiris as lord of the underworld who had died, been judged, and risen again, provided the first common focus for postmortal expectation and concern. Elaborate funerary rites were accompanied by preparations for judgment before Osiris assisted by assessors. The candidate for new life asserted his innocence of numerous moral transgressions and saw his own heart weighed on scales against a feather representing truth in the sense of divine order (*maat*). Gradually, efforts were made to organize the outcome of the judgment in advance by preparing in advance lists of good deeds and declarations of innocence. This process was ritualized and commercialized through the sale of appropriate rolls of text to be filled in with names before death, modern scholars have named these texts collectively *The Book of Going Forth by Day*. On the other hand, these phenomena may be regarded as the earliest indication of attempts to establish an individual's worth—in effect to “make merit” for him, in order to achieve a desired effect after death.

The idea of merit apparently did not develop in Mesopotamia, where notions of existence after death remained shadowy and pessimistic. Nor did Canaanite or early Hebrew views of death include a postmortal goal toward which the individual could work. The Hebrew concept of She'ol as a silent, forgotten abode beneath the earth was related at least in type to the Babylonian.

The clearly delineated cosmological dualism of Iranian religion gave prominence to the alternatives awaiting the individual after death. The spiritual position of the soul was determined in accordance with its behavior before departure from the body. In principle, the thinking is analogous to the Egyptian conceptions mentioned above, for there is evidence of attempts to influence the judgment. Eschatologically, Iranian ideas strongly influenced developing Judaism, so that She'ol became the place of postmortal punishment, while up to seven heavens were enumerated as abodes of pleasure and bliss.

THEISTIC RELIGIONS. A theistic worldview in the Abrahamic tradition does not necessarily entail a detailed doctrine of merit, as may be seen in the cases of the Qumran community, very early Christianity and, later, Islam. In both the teachings of Qumran and of the New Testament, the concept of calculable merit is entirely lacking. What is required is total, inward obedience to the law, or will, of God. The subsequent development of Christian teachings on merit has been variously described and interpreted. Historical priority must be ascribed to the rabbinic teachings on merit, or merits, which, in a transposed form, underlay Paul's interpretation of the death of Jesus. (This relationship has been skillfully delineated by W. D. Davies in *Paul and Rabbinic Judaism*, 2d ed., London, 1955, pp. 227–284.)

The rabbinic doctrine of merit, though articulated in detail in the first four centuries of the common era, is based on two fundamental ideas which reach much further back

in Jewish tradition. These are, first, that keeping the Mosaic covenant with God (i.e., observing the Torah), will lead to blessing and welfare and, second, that the responsibility and benefit of this covenant are essentially corporate and pass from generation to generation. Stated negatively, disobedience leads to punishment in the form of social or political suffering, but this punishment can be moderated by credit accumulated by previous generations. Looking forward, the idea of caring for one's children spiritually as well as physically was a motivating force for assiduousness in religious duty and charitable works. The justifiableness of a man, his standing before God in these respects, is summed up in the term *zakkut*.

As Davies points out, this line of thought is not without variations: some rabbis taught that the dividing of the waters at the exodus took place on account of the merits of Abraham, or the combined merits of Abraham, Isaac, and Jacob, while others stressed the meritorious faith of the Israelites at the time. The underlying spirit of the teaching is neatly expressed in Arthur Marmorstein's summary of the ideas of Rabbi Yanna'i: “A man who kindles light in daytime for his friend when it is light, what benefit has he derived? When does he obtain any advantage from light? In case he kindles it in the night-time, in darkness. The affection Israel has shown in the wilderness was kept for them from that time, from the days of Moses” (Marmorstein, 1920, p. 17). From regarding the keeping of the Torah as meritorious, and beneficial for future generations, it was not far to the idea that God gave the Torah so that merit could be achieved or even the idea that the whole of creation was designed to this end.

As to life beyond death, reference to this was by no means lacking, and it was considered possible that some individuals, through lack of merit, might fail to be rewarded. Nevertheless, the calculation of one's credits and debits was always regarded as ultimately in the hands of God, so that while relatively good men might tremble, even the wicked might hope. In practical terms, merit was typically considered to accrue through “faith, charity, hospitality, the circumcision, Sabbath and festivals, the study of the Torah, repentance, the Holy Land, the Tabernacle, Jerusalem, the tithe, and the observances in general” (ibid., p. 65).

With Islam, it was, and is, expected that realizable duties will be fulfilled. However, God, and only God, knows what is actually possible for each individual; moreover, he is patient of human weakness. Thus, insofar as it is possible, the pilgrimage to Mecca is required of Muslims. This may be regarded as a negative doctrine of merit in that every Muslim has to assess whether or not he or she is able to make the pilgrimage. While Islam has always recognized that some acts are not strictly required but are nevertheless praiseworthy, any assessment of human behavior for the purpose of achieving salvation was quickly ruled out by the strong emphasis on the preeminent knowledge and grace of God, which amounted to predestination. A broadly similar doctrinal structure was to appear, in the Christian world, in Reformation theology, and in Jansenism.

COMPARATIVE REFLECTIONS. A simple typology of religions with respect to concepts of merit and broadly related aspects of religiosity may be delineated in four parts.

First, it should be noted that much religion simply has not included the concept of merit, especially when notions of the future are shadowy, when a future existence is prepared for by elaborate funerals for royalty only, or when life after death is understood in any case to be the same for everybody. Thus, primal religions—even, for example, the highly developed Japanese Shintō—presuppose neither a radical dividing of the ways based on merit nor any elaborate path of cumulative spiritual development for the individual. Such religions naturally bear powerful religious values, such as a sense of cosmological orientation and belonging. Transactional religiosity, however, is directed in this context towards proximate, this-worldly, goals such as social and economic well-being, the avoidance of disaster and sickness or, in a modern differentiated economy, personal welfare and success.

Second, when clear-cut conceptions of future existence have developed, we see an extension of transactional religiosity into the future, as in Egyptian and Iranian religions, or, in a very different way, in Indian religion. The same holds for Chinese religion, though not without influence from Indian Buddhism. Such transactionalism may or may not be morally differentiated. The key feature here is that an element of future-directed management and even calculation is introduced to cope with an assumed judgment to come or with implications of the present for future existences. In principle, responsibility lies with the individual, although he may seek the assistance of priests, or, in the interesting variation of rabbinic Judaism, draw on the worthy performance of previous generations. Islam also belongs to this type, although in this case there is little interest in calculation and a great reliance on God's compassionate appraisal of what could realistically be expected from each individual in the circumstances of life.

The third type is represented above all by Buddhism and Christianity, although these emerged from quite different assumptions. Here we see that specific doctrines of merit arose at the point of intersection between transactional religiosity and soteriological concern. The natural, or primal, community is left on one side, and the possibility of the transfer of merit from transcendental or intermediate beings is envisaged. Interestingly, this latter idea did not go unopposed in Theravāda Buddhism, where it was criticized on ethical grounds. At the same time, the recommendation of merit-creating activities by the priesthood becomes normal.

Fourth, Buddhism and Christianity are similar not only in having produced an individualized soteriology based, at times, on a doctrine of merit. They have also both seen movements within the tradition which radically internalized the reception of spiritual assistance or grace. For Christianity, this is connected with the Reformation; for Buddhism, such movements are associated with the teachings of the Jap-

anese patriarchs Hōnen (1133–1212) and, above all, Shinran (1173–1263). The latter argued, for example, that there was no value in reciting the Nembutsu (calling on the name of Amida Buddha) on behalf of the deceased because as a human work it could not benefit them in any way. All that was possible was reliance on the grace of Amida Buddha to effect rebirth in the Pure Land in the western heavens. Thus, the soteriological focus was internalized and the idea of merit was transformed from within. These subjectivizing trends within the Buddhist and Christian traditions, though influential, have not become dominant, and, broadly speaking, the vocabulary of merit continues to play a distinctive role in both.

Revised Bibliography

MERIT: BUDDHIST CONCEPTS

The notion of merit (Skt., *punya* or *kuśala*; Pali, *puñña* or *kuśalā*) is one of the central concepts of Buddhism, and the practice of merit-making is one of the fundamental activities of Buddhists everywhere.

The idea of merit is intimately bound up with the theory of *karman*, the Indian law of cause and effect. According to this theory, every situation in which an individual finds himself is the result of his own deeds in this or a previous lifetime, and every intentional act he now performs will eventually bear its own fruit—good or bad—in this or a fu-

ture lifetime. Thus present felicity, wealth, physical beauty, or social prestige may be explained as the karmic reward of past deeds of merit, and present suffering, poverty, ugliness, or lack of prestige may be attributed to past acts of demerit. In the same manner, present meritorious deeds may be expected to bring about rebirth in a happier station as a human being or as a deity in one of the heavens, and present demeritorious deeds may result in more suffering and in rebirth as an animal, a hungry ghost (Skt., *preta*), or a being in one of the Buddhist hells. A mixture of meritorious and demeritorious acts will bear mixed karmic results.

This basic understanding of the workings of merit and demerit can be traced back to the time of the Buddha, or the sixth to fifth centuries BCE. It received its fullest elaboration later, however, in the vast collections of *jātakas* (stories of the Buddha's previous lives), *avadānas* (legends), and *ānisaṃsas* (tales of karmic reward), which were and continue to be very popular in both Hīnayāna and Mahāyāna Buddhism.

MERIT-MAKING ACTIVITIES. There are, according to the Buddhists themselves, many ways of making merit. One of the most comprehensive listings of these is the noncanonical catalog of “ten meritorious deeds” (Pali, *dasa-kusalakamma*), which has been widely influential in South Asia. It comprises the following practices:

1. Giving (*dāna*)
2. Observing the moral precepts (*sīla*)
3. Meditation (*bhāvanā*)
4. Showing respect to one's superiors (*apacāyana*)
5. Attending to their needs (*veyyāvacca*)
6. Transferring merit (*pattidāna*)
7. Rejoicing at the merit of others (*pattānumodana*)
8. Listening to the Dharma, that is, the Buddha's teachings (*dharmasavana*)
9. Preaching the Dharma (*dharmadesanā*)
10. Having right beliefs (*ditṭhijjukamma*)

It is noteworthy that most of the deeds on this list (with the possible exception of the ninth, which is more traditionally a monastic function) can be and are practiced both by Buddhist laypersons and by monks. It is clear, then, that merit making in general is a preoccupation not only of the Buddhist laity (as is sometimes claimed) but also of members of the monastic community, the *saṃgha*. In this regard, it is interesting too that meditation—a practice that is sometimes said to be an enterprise not concerned with attaining a better rebirth but aimed solely at enlightenment—is also seen as a merit-making activity and is engaged in as such by both monks and laypersons.

Another noteworthy item on this list is *sīla*, the observance of the moral precepts. For the laity, this consists of following the injunctions against killing, stealing, lying, sexual misconduct, and intoxication. On certain occasions, howev-

er, *sīla* may also involve the voluntary acceptance of three additional precepts, sometimes counted as four, against eating after noon, attending worldly amusements, using ornaments or perfumes, and sleeping on a high bed. Monks, who by their very status are thought to be more filled with merit than the laity, are expected to observe all the above precepts at all times; in addition, there is a tenth injunction for monks against the handling of money.

The most meritorious practice on this list, however, is giving, or *dāna*. In many ways, this is the Buddhist act of merit *par excellence*. Monks engage in it by giving the Dharma to laypersons in the form of sermons or advice, or by the example of their own lives. Laypersons practice it by giving to the monks support of a more material kind, especially food, robes, and shelter. The ideology of merit thus cements a symbiotic relationship between the *saṃgha* and the laity that has long been one of the prominent features of Buddhism.

Not all lay acts of *dāna* make equal amounts of merit. The specific karmic efficacy of any gift may depend on what is given (quantity and quality can be significant), how it is given (i.e., whether the gift is offered with proper respect, faith, and intention), when it is given (food offerings, for example, should be made before noon), and, especially, to whom it is given. Although *dāna* may sometimes be thought to include gifts to the poor and the needy, offerings made to the *saṃgha* are seen as karmically much more effective. Thus, making regular food offerings to the monks, giving them new robes and supplies, funding special ceremonies and festivals, building a new monastery, or having a son join the *saṃgha* are all typical lay acts of *dāna*. These activities share a common focus on the monks and are consistently ranked as more highly meritorious than other types of social service; they are even more highly valued than observation of the moral precepts.

Metaphorically, acts of merit are seen as seeds that bear most fruit when they are planted in good fields of merit (Skt., *punyaśeṭra*), and the most fertile field of merit today is the *saṃgha*. This obviously has had tremendous sociological and economic implications. In Buddhist societies, the *saṃgha* often became the recipient of the excess (and sometimes not so excessive) wealth of the laity, and thus from its roots it quickly grew into a rather richly endowed institution.

Traditionally, however, the best “field of merit” was the Buddha himself. The model acts of *dāna* that are recounted in Buddhist popular literature often depict gifts that are made to him. Today, in addition to donations to the monks, offerings are made to images and other symbolic representations of the Buddha and are still thought of as highly meritorious. The roots of *dāna*, therefore, lie not only in a desire to do one's duty to the *saṃgha* but also to express one's devotion to the faith in the Buddha. This experiential cultic side of merit-making has often been overlooked, yet it is frequently emphasized in popular Buddhist literature.

AIMS OF THE MERIT MAKER. In addition to expressing individual faith and devotion, the merit maker may be said to be interested in three things. First, an individual wants to obtain karmic rewards for himself in this or the next lifetime. Thus, for example, he might wish, by virtue of his acts of merit, to enjoy long life, good health, and enormous wealth, and never to fall into one of the lower realms of rebirth where suffering runs rampant, but to be reborn as a well-to-do person or a great god in heaven. Many such statements, in fact, may be found in the inscriptions left by pious Buddhists throughout the centuries to record their meritorious deeds, and in anthropologists' descriptions of present-day merit-making practices.

Second, the merit maker may also be interested in enlightenment. It is sometimes claimed that this is not the case, that beyond receiving karmic rewards the merit maker has no real ambition for *nirvāṇa*. To be sure, in the oldest strata of the Buddhist canon *nirvāṇa* is not thought to be attainable by merit-making alone, but Buddhist popular literature soon tended to take a different view. In the Avadānas, for example, even the most trivial acts of merit are accompanied by a vow (Skt., *praṇidhāna*) made by the merit maker to obtain some form of enlightenment in the future. This enlightenment may be a long time in coming, but when it does it is portrayed as the fruit of the merit maker's vow and act of merit, and not as the result of any meditative endeavor.

In present-day Theravāda practice, these same vows take the form of ritual resolves to be reborn at the time of the future Buddha Maitreya and to attain enlightenment at that time. Far from rejecting the possibility of *nirvāṇa*, then, the merit maker, by means of a *praṇidhāna*, can link an act of merit to that very soteriological goal.

THE TRANSFER OF MERIT. Third, the merit maker may also wish to share his or her merit with others, especially with members of the family. By clearly indicating whom the merit maker intends to benefit by a good deed, an individual can transfer the merit accrued to that other person. This does not mean that one thereby loses some of one's own merit; on the contrary, one makes even more, since the transfer of merit is in itself a meritorious act.

Such sharing of merit is sometimes thought to be in contradiction to one of the basic principles of *karman*, according to which merit-making is an entirely individual process whereby one reaps only what one has sown oneself. While this may be correct theoretically, and while it is true that the transfer of merit is not mentioned explicitly in the earliest canonical sources, the practice quickly became very common. It had always been the case, of course, that an individual could undertake an act of merit on behalf of a larger social group. Thus, the housewife who gives food to a monk on his begging round makes merit not only for herself but for her whole family. Buddhist inscriptions and popular literature, however, testify also to the wishes of donors to have their merit benefit somewhat more remote recipients, such

as a deceased parent or teacher, the suffering spirits of the dead, or, more generally, all sentient beings.

Probably one of the motivations for such sharing of merit was the desire to continue, in a Buddhist context, the Brahmanical practice of ancestor worship. The transfer of merit by offerings to the *saṃgha* simply replaced the more direct sacrifice of food to the spirits of the dead.

The literalness with which this transfer was sometimes understood is well illustrated by the story of the ghosts of King Bimbisāra's dead relatives. They made horrible noises in his palace at night because they were hungry, for the king had neglected to dedicate to them the merit of a meal he had served to the *saṃgha*. Therefore he had to make a new offering of food to the monks and properly transfer the merit. Once fed, the ghosts no longer complained.

It is worth noting in this story the crucial role played by the field of merit—in this case the *saṃgha*—in successfully transmitting the benefits of meritorious deeds to beings in the other world: the monks act as effective intermediaries between two worlds. They continued to enjoy this role in China and Japan, where their efficacy in transferring merit to the ancestors was much emphasized.

MERIT-MAKING AND THE BODHISATTVA IDEAL. Although the doctrine of the transfer of merit has its roots in the Hīnayāna, it was most fully developed in the Mahāyāna. There it became one of the basic practices of the *bodhisattva* (buddha-to-be), who was thought to be able freely to bestow upon others the merit accrued during a greatly extended spiritual career.

Actually, there are two stages to a *bodhisattva*'s meritorious career. In the first, while seeking enlightenment, he amasses merit by good deeds toward others. In this, his actions are not much different from those described in the Jātakas and attributed to the Buddha in his former lives. In the second stage, the *bodhisattva* (or, in Pure Land Buddhism, the Buddha Amitābha), infinitely meritorious, dispenses merit to all beings.

After initially awakening in himself the mind intent on enlightenment (Skt., *bodhicitta*), the *bodhisattva* begins his career with the path of accumulation of merit (*saṃbhāramārga*), during which he performs great acts of self-sacrifice over many lifetimes and begins the practice of the perfections of giving, morality, patience, energy, meditation, and wisdom. In all of this, his actions are governed by his vow for enlightenment (*praṇidhāna*). Unlike the vows of the Hinayanists, however, those of a *bodhisattva* can be quite elaborate (especially in Pure Land Buddhism), and generally involve his willingness to postpone individual attainment of final *nirvāṇa* in order to be able to lead all sentient beings to enlightenment.

As a result of such altruism, certain great *bodhisattvas*, such as Avalokiteśvara, Mañjuśrī, Kṣitigarbha, or Samantabhadra, came to be seen as having stored up virtually inexhaustible supplies of merit, which they can now dispense to

sentient beings in order to allay their sufferings. The mechanism by which this is done is that of the transfer of merit, but this is now seen as a more total and compassionate act than in the Hīnayāna. Not only does the *bodhisattva* confer on others the benefit of specific deeds, but he also seeks to share with them his entire store of merit, or, to use a different simile, his own actual roots of merit (*kuśalamūla*). In this, all desire for a better rebirth for himself has disappeared; the only sentiment remaining is his great compassion (*mahākaruṇā*) for all sentient beings in their many states of suffering.

BIBLIOGRAPHY

Four kinds of sources are most useful in considering the practice of merit-making in Buddhism.

First, there are anthologies of popular Buddhist stories illustrating the workings of merit and demerit. These are too vast and numerous to be described here, but they include the Jātakas (tales of Buddha's former lives), the Avadānas (legends about the lives of individual Buddhists), and innumerable stories of karmic rewards either included in commentaries on canonical works or gathered in separate collections. For translations of examples of each of these three types, see *The Jātakas*, 6 vols. (1895–1905; London, 1973), edited by E. B. Cowell; *Avadāna-ṣataka: Cent légendes bouddhiques*, translated by Léon Feer (Paris, 1891); and *Elucidation of the Intrinsic Meaning: The Commentary on the Peta Stories*, translated by U Ba Kyaw, edited by Peter Masefield (London, 1980).

Second, there are the descriptions and discussions of merit-making practices in present-day Buddhist societies by anthropologists and other observers in the field. For a variety of these works, which also present significant interpretations of merit making, see, for Sri Lanka, Richard F. Gombrich's *Precept and Practice* (Oxford, 1971), chapters 4–7; for Thailand, Stanley J. Tambiah's "The Ideology of Merit and the Social Correlates of Buddhism in a Thai Village," in *Dialectic in Practical Religion* (Cambridge, 1968), edited by Edmund Leach; and, for Burma, Melford E. Spiro's *Buddhism and Society* (New York, 1970).

Third, there are the inscriptions left by merit makers in India and elsewhere to record their acts of merit. Various examples of these invaluable and fascinating documents may be found in Dines Chandra Sircar's *Select Inscriptions Bearing on Indian History and Civilization*, vol. 1, *From the Sixth Century B.C. to the Sixth Century A.D.*, 2d ed. (Calcutta, 1965).

Finally, there are the more specialized scholarly studies of specific aspects of merit-making. Only a few of these can be mentioned here. For a fine discussion of the various connotations of the word for "merit," see Jean Filliozat's "Sur le domaine sémantique de puṇya," in *Indianisme et bouddhisme: Mélanges offerts à Mgr. Étienne Lamotte* (Louvain, 1980). For two very helpful studies of the transfer of merit in Hīnayāna Buddhism, see G. P. Malalasekera's "Transference of Merit in Ceylonese Buddhism," *Philosophy East and West* 17 (1967): 85–90, and Jean-Michel Agasse's "Le transfert de mérite dans le bouddhisme pāli classique," *Journal asiatique*

226 (1978): 311–332. The latter is an especially suggestive article and has an English summary. For a social scientist's view of the way in which merit-making combines with other forces in defining social roles and hierarchies, see L. M. Hank's "Merit and Power in the Thai Social Order," *American Anthropologist* 64 (1962): 1247–1261. Finally, for a clear discussion of the place of merit in the development of the *bodhisattva* ideal, see A. L. Basham's "The Evolution of the Concept of the Bodhisattva," in *The Bodhisattva Doctrine in Buddhism* (Waterloo, Ontario, 1981), edited by Leslie S. Kawamura.

JOHN S. STRONG (1987)
Revised Bibliography

MERIT: CHRISTIAN CONCEPTS

The term *merit* derives directly from the Latin *meritum* as used by theologians in Western Christianity beginning with Tertullian (160?–225?). Earlier Christian apologists had stressed the importance of postbaptismal works as a preparation for eternal life, and indeed this line of thought can be traced back in a general way to various New Testament writings. The important question as to whether the third-century teaching on merit emerged naturally out of early Christianity or whether it was a distortion, or at best a countertheme, is variously assessed by Catholic and Protestant theologians. Thus, in an article on merit (1962), Günther Bornkamm emphasized the absence of any concept of merit in the New Testament, while his co-writer Erdmann Schott roundly declared that "only the Roman Catholic church developed a doctrine of merit." However, both of these writers recognize the presence of those elements in early Christian writings, including the New Testament, which writers with a Catholic viewpoint see as the basis for the development of the doctrine. These elements are none other than judgment, reward, and punishment. Thus according to Anselm Forster (1965) references to such themes are so numerous that the apostolic fathers and the apologists simply brought the idea of merit into their proclamation of salvation as circumstances required, without any need for systematic reflection at that time.

The New Testament writers certainly made much use of this complex of ideas, as seen for example in the vision of judgment in *Matthew 25*. However, such ideas do not in themselves amount to or necessarily require the development of a doctrine of merit, as may be observed in parallel situations in the history of religions. Historically, there certainly was no general belief in the New Testament writings that some sufficient degree of merit either should or even could be accumulated for any purpose. The main thrust of early Christian teaching was rather to overcome any calculating religiosity in favor of a trusting reliance on the promises of God and spontaneous, uncircumscribed works of love. This holds good both for the teaching of Jesus himself, as far as this can be precisely ascertained, and also for the teaching of the major theological exponents, John and Paul. A doctrine of merit as such did not clearly arise until the third century.

PATRISTIC VIEW OF MERIT. With Tertullian, well known for his legal metaphors, the doctrine of merit came into semiformal existence. He distinguished between good works as a source of merit and nonobligatory good works as a source of extra merit, thus introducing an element of calculation. He also taught that human sinners are required to render satisfaction to God, a satisfaction that could be fulfilled by the offering of merits. Other church fathers accepted Tertullian's teaching, above all with a view to the care of postbaptismal life within the church.

Thus Cyprian (c. 205–258), bishop of Carthage, taught that sins could be purged by charitable works and by faith. This did not refer to those sins contracted before baptism, for they were purged by the blood and sanctification of Christ. But, Cyprian says in *On Works and Charity*, “sic elemosyne extinguet peccatum” (“as water extinguishes fire, so charitable work extinguishes sin”) and “elemosynis atque operationibus iustis” (“as the fire of Gehenna is extinguished by the water of salvation, so the flame of transgressions is assuaged by almsgiving and just works”). He goes on to say that God is satisfied by just works and that sins are purged by the merits of mercifulness (*misericaordiae meritis*). Indeed, by charitable works our prayers are made effective, our lives saved from danger, and our souls liberated from death.

Of importance for later understanding of the doctrine was the debate between Pelagius, Augustine, and others in the first part of the fifth century. Pelagius, whose teaching was current in Rome and North Africa, stressed the power of man through free will to choose and practice the good, and he viewed grace conveyed by the example and stimulus of Christ as a welcome but theoretically not absolutely essential extra. Augustine considered Pelagius's teaching to present a faulty doctrine of man and to render Christian salvation all but superfluous. For the present subject the debate is of importance in that it had the effect of subordinating teaching on merit to the doctrine of grace. Since Pelagianism was condemned as heretical at the councils of Milevum and Carthage (in 416 and 418), Augustine's treatment of the subject set the framework for later Western definitions and ultimately for the divergence that broke out at the Reformation.

It may be noted in passing that the concept of merit was never worked out in detail and did not become a matter of controversy in the Eastern (Orthodox) churches because the operation of divine grace and human free will were and are seen in terms of synergy. By this is meant a cooperation of powers that are unequal but both essential. Although human response and action are necessary within the event of salvation, the preeminent role of grace means that calculations are of no relevance. The perfect example of synergy is provided by Mary, honored as the mother of God (*theotokos*).

MEDIEVAL AND REFORMATION VIEWS OF MERIT. In medieval Latin Christendom an increasingly carefully defined doctrine of merit was current. This doctrine was, with minor variations, consistent from Peter Abelard up until the Reformation. Both obligatory and nonobligatory (supererogatory) works were regarded as meritorious in the sense that they contributed, within the overall economy of divine grace, to the ensuring of salvation. Grace itself can be understood at various levels: all-important was *gratia praeveniens*, but Peter Lombard distinguished between the self-effective *gratia operans* and the *gratia cooperans* that assists in the creation of merit. Widespread in the Middle Ages was the distinction between acts that ensure divine recognition and acts that merely qualify for it at divine discretion. These two types of merit are referred to as condign merit (*meritum de condigno*) and congruent merit (*meritum de congruo*) respectively. However, the sovereignty of God was maintained by the teaching, for example of Thomas Aquinas, that while merit arises equally from free will and from grace, the effective status assigned to condign merit was itself still dependent ultimately on grace. The underlying idea here, not usually made explicit, is that the church in its teaching function can reliably assert the positive availability of grace in such circumstances. Some discussion centered on the possibility of regaining a state of grace through merit after committing deadly sin, which Bonaventure considered possible and Thomas impossible. Another aspect arose with John Duns Scotus, who emphasized the crucial role of the divine acceptance of merit over against the value inherent in the work itself. This permitted the assertion that God recognizes the merits of supernaturally assisted works within the economy of salvation rather than of those performed by man in his natural state simply because he so wishes. (For more details on these and other aspects of the medieval doctrine of merit, see Schott, 1962.)

The doctrinal subtlety of many medieval theologians was clearly directed toward safeguarding the principle of the prior, determinative grace of God over against any idea that salvation could be ensured by calculated acts on man's part. However, not all medieval Christians had the ability, or, in their often short and hard lives, the leisure, to appreciate these points. Since theology had a place for individual acts that might be meritorious, that is, of assistance in securing salvation rather than damnation, the common assumption was that some of these acts had better be performed. It was plainly believed that bad things had to be compensated for

by good things if lengthy or eternal punishment was to be avoided, and this meant in daily religious life: penance, good works, and the sacraments. Thus salvation became for many a transaction, albeit a mysterious one. The sale of indulgences in respect of a plenary remission of sins may be regarded as an extreme example of this and was understandably criticized at the Reformation as an abuse. That the element of weighing, or paying, had become a standard feature of Western Catholic tradition, was evident also, however, in the large numbers of chantries endowed for masses to be said for the patron's benefit, via a transfer of merit, after his death.

The Reformation saw a massive reassertion of grace and a straightforward rejection of reliance on works of any kind. With Martin Luther the language of justification was central but was used paradoxically, as in Pauline literature, to refer to God's gracious justification of man through Christ, even though man himself is not able to stand before God in judgment. With this fundamental shift of emphasis, which became increasingly critical of current religious practice, the doctrine of merit related to works was swept away. Yet the vocabulary of merit did not immediately disappear. Indeed the traditional terminology of condign and congruent merit occurs in Luther's *Dictata super Psalterium* (Lectures on the Psalms) and serves as the basis for a gradual transposition of the concept of merited salvation into that of unmerited salvation (cf. Rupp, 1953, esp. pp. 138f.). Thus the idea of the insufficiency of merit or of works provided Luther at one and the same time with a polemical differentiation from the existing tradition of Western Christianity and an invitation to faith in the saving and transforming power of grace leading to good works as the fruit of Christian life. As far as these matters were concerned, the position of other reformers, including John Calvin with his formula *sola gratia* (by grace alone), was essentially similar. As a result, wholesale changes occurred in the practical forms of religion. At the same time the transactional aspect was concentrated in the doctrine of atonement through the merits of the death of Christ.

MERIT IN CATHOLICISM. The positive significance of merit in the context of the religious life was reaffirmed for Western Catholicism at the Council of Trent (1545–1563), the relevant definitions and thirty-three anathemas being contained in the sixteenth chapter of the text for the sixth session: "De fructu justificationis, hoc est, de merito bonorum operum, deque ipsius meriti ratione" (Denzinger, 1965). The argument is tightly linked to the concept of justification, which is viewed as a process within the believer that leads to meritorious good works. Since the merit of good works was considered to bring about specific results contributing to the increase of grace in the present life, to eternal life itself, and to the increase of glory, room was left for the continued pastoral management of religious life in terms of relative achievement, within the overall context of divine grace. This has essentially been the basis of Catholic religiosity ever since.

Thus the marketing of indulgences was abandoned, but the attainment of an indulgence through devotional practice

(e.g., on "the first nine Fridays") or through special sets of prayers (Our Fathers, Ave Marias, etc.), leading to a reduction of the number of days required to be spent in purgatory (by 500, 1,000, etc.), has continued down to the present. Moreover such remissions can, via the communion of saints and the work of Christ himself, be applied to the suffering of souls already in purgatory, through prayer, fasting, alms, and the saying of Mass. As one popular nineteenth-century work put it: "She [the church] appears before the tribunal of the judge, not only as a suppliant, but also as the stewardess of the treasure of the merits of Christ and his saints, and from it offers to him the ransom for the souls in purgatory, with full confidence that he will accept her offer and release her children from the tortures of the debtor's prison" (F. J. Shadler, *The Beauties of the Catholic Church*, New York, 1881, p. 404). One could hardly hope to find a clearer statement both of the idea of the transfer of merit and of the transactional manner in which merit is, or can be, understood. Other presentations content themselves with a loose statement of the need for both grace and works, thereby allowing elaboration at the pastoral level. Thus a modern catechism declares: "We can do no good work of ourselves toward our salvation; we need the help of God's grace," but also: "Faith alone will not save us without good works; we must also have hope and charity" (Catholic Truth Society, *A Catechism of Christian Doctrine*, London, 1971, pp. 22f.). The consciousness of ordinary Catholic believers may be summed up in the view that while one cannot ensure one's own salvation one is certainly expected to make a contribution.

In recent years theological controversy about merit in the context of Christianity has lost much of its sharpness for three reasons. First, the theme is subsumed, for Protestants, into the greater theme of faith and grace over against works. From this point of view relying on merits or merit is simply a variant form of relying on works and therefore hardly requires separate consideration. Second, although the concept of merit is retained by Catholics, it is usually made clear, at least in formal accounts, that the prior grace of God is an essential condition. Although, admittedly, this does not meet Protestant objections to all and every form of reliance on works, it does mean that from the Catholic side, too, attention is directed fundamentally toward man's position in the overall economy of divine grace. Third, and this applies to Protestant and Catholic theologians alike, interest is directed toward other issues such as the historical and social responsibilities of Christianity, questions arising through the encounter with non-Christian traditions, and philosophical reflections about the very nature of religious language. In such a perspective, while theological viewpoints regarding merit remain distinct, it is not currently considered to be a matter requiring intense or urgent debate.

Revised Bibliography

MERLIN. The origins of Merlin, the magician, prophet, and guardian of the legendary British king Arthur and a central figure in medieval Arthurian romance in both French and English, are to be found in a number of early Welsh poems and related material in Latin. The name *Merlin* was created by the twelfth-century pseudohistorian Geoffrey of Monmouth, who described the conception of "a fatherless boy" by a nun who had been impregnated by an incubus in the South Wales town of Caerfyrddin (modern-day Carmarthen). The omniscient boy's advice to King Vortigern suggests that Geoffrey modeled his Merlin on an earlier Welsh story of the wonder-child Ambrosius. Although two later exploits, the removal of Stonehenge from Ireland to England and the disguising of Uter Pendragon as Gorlois so that he might sleep with the latter's wife (a ruse that results in the conception of Arthur), are not found in the earlier sources, Merlin's major role as a political prophet in Geoffrey's *Historia regum Britanniae* is traditional.

The prophet's birth at Caerfyrddin is a sure sign that he is in fact the Welsh Myrddin, whose name is variously spelled *Merddin*, *Merdin*, and *Myrtin*, which Geoffrey changed to *Merlin* to avoid unfortunate associations with the French *merde*. There are extant a large number of medieval Welsh poems claimed to have been composed by a fictional

Myrddin. The majority of these are post hoc vaticinations and contemporary comments on political events attributed to the famed prophet, who had acquired this role by the tenth century, as the poem *Armes Prydein* (c. 935) shows, a role he was to retain throughout the Middle Ages. There may also be discerned, however, a substratum of story to which other pre-twelfth-century poems allude and which can be reconstituted from these and other sources. Myrddin, a member of the court of King Gwenddoleu, became insane at the Battle of Arfderydd (fought in 573 in modern-day Cumbria). He fled in terror from King Rhydderch of Strathclyde to the Caledonian Forest (in the Scottish Lowlands), and lived there the life of a wild man (his Welsh epithet is *Wyllt*, "wild"). He was befriended by his sister, or lover, Gwenddydd, to whom he prophesied events at court. These traditions were used by Geoffrey of Monmouth in his poem *Vita Merlini*, which is designed to correct the nontraditional elements and to supplement the picture he had earlier given in his *Historia*. His two Merlins appeared to contemporaries as distinct characters named Merlinus Ambrosius (in the *Historia*) and Merlinus Silvestris (in the *Vita*), but it is better to regard the distinction as being due to Geoffrey's imprecise knowledge of the genuine tradition at the time of his writing of the *Historia*.

The northern Myrddin is found under the name *Lailoken* in the twelfth-century *Vita Kentigerni* of Joceline of Furness, and he has an analogue in the ninth-century Irish character Suibhne Geilt. Lailoken's tale was relocated in South Wales, and, according to the claims of A. O. H. Jarman, the madman was given a new name derived from *Caerfyrddin*. Rachel Bromwich, stressing Myrddin's status as a poet in Welsh bardic tradition, suggests that he was a sixth-century historical poet, none of whose work is extant but who developed legendary features, as happened to Taliesin. There is little doubt that the sagas of two characters have influenced one another, and they are linked in a pre-twelfth-century dialogue poem which may have been known to Geoffrey of Monmouth, who used the device of dialogue in the *Vita*. Although Welsh literature does not show the influence of later Arthurian romance in the character of Myrddin, late medieval Welsh poetry does contain allusions to his imprisonment and death and to erotic elements in the legend.

BIBLIOGRAPHY

A good and concise account of the development of the theme of Myrddin/Merlin is presented in *The Legend of Merlin* (Cardiff, 1960) by A. O. H. Jarman. Consult, also, Jarman's article titled "A oedd Myrddin yn fardd hanesyddol," *Studia Celtica* 10/11 (1975–1976): 182–197. This article is written in response to Rachel Bromwich's piece, "Y Cynfeirdd a'r Traddodiad Cymraeg," *Bulletin of the Board of Celtic Studies* 22 (1966): 30–37. A thorough review of the important issues is found in *Trioedd Ynys Prydein: The Welsh Triads*, 2d ed. (Cardiff, 1978), which was edited and translated by Bromwich. For views on Merlin's historical origins see Nikolai Tolstoy, *The Quest for Merlin* (London, 1985).

BRYNLEY F. ROBERTS (1987 AND 2005)

MERTON, THOMAS (1915–1968), Roman Catholic monk, author, and poet. Merton pursued a career that may be divided into three distinct phases: secular, monastic, and public. The secular career encompasses the first twenty-six years of his life and culminates with his entrance into the abbey of Gethsemani, Kentucky, in 1941. The basic elements that influenced his later life were set in place during this period. Merton was born on 31 January 1915 in Prades, France, the first child of artist Ruth Jenkins Merton of Zanesville, Ohio, and artist Owen Merton of Christchurch, New Zealand. The family moved to New York City the next year to escape World War I. The loss of his mother while still a child, his father at age sixteen, and a younger brother in World War II, contributed to Merton's sense of the tragic contingency of human life and, possibly, to his decision to enter monastic life. The influence from two parents who were artists and instinctive pacifists bore fruit in their son's pursuits as writer, poet, and prophet of nonviolence.

Merton attended school in the United States, Bermuda, France, and England before commencing higher education. He entered Clare College of Cambridge University on scholarship and completed his undergraduate education at Columbia University in New York. His friendships with Professor Mark Van Doren, the Pulitzer Prize poet, and fellow student Robert Lax, the future poet, helped to develop his already existing interests in mysticism, poetry, and monasticism. He converted to Roman Catholicism in 1938, completed an M.A. in literature from Columbia in 1939, and entered the abbey of Gethsemani in 1941 while working on a never-completed Ph.D. thesis on Gerard Manley Hopkins and teaching English at Saint Bonaventure University in New York State.

The second phase of Merton's career is his life as a monk of the Cistercian Order of the Strict Observance. The rigor of this life is characterized by perpetual silence, a lifelong vegetarian diet, and many hours of daily prayer starting at 2:00 AM. The purpose of this regimen is the development of a contemplative life. Many of those who knew Merton well believe he became a mystic during these years. The last three years of his life were also lived as a hermit, removed from the communal life of the monastery.

The third phase of Merton's life, the public career, is somewhat coincident with the second and is marked by an intense involvement in writing, social protest, and Asian spirituality. The most famous of his sixty books is *Seven Storey Mountain*, an autobiography about a personal search that brings him from unfocused activism to contemplation and from a life of self-indulgence to self-discipline. The writings of Merton include eight volumes of poetry and some six hundred articles.

If a career in writing was unconventional, Merton's involvement in social protest was even less part of the monastic model. He objected vehemently to the United States' involvement in the Vietnam War, the nuclear arms race, violations of the rights of black Americans, and the dehumanizing

effects of technology. This protest caused him difficulty at times with readers who favored a pietistic style of writing, with church superiors, and with members of his monastic community. He persevered in putting his views forward, however, believing that mystics owed their contemporaries the value of their own unique witness.

In the final years of his life, Merton was committed to Hindu and Buddhist spiritual wisdom without diminishing his attachment to Catholic Christianity. Zen Buddhism, most especially, appealed to Merton because of its emphasis on experience rather than doctrine. Merton searched for God through participation in the ancient spiritualities of Asia on a long journey to the East that was his personal pilgrimage and a metaphor of his life. He died of accidental electrocution in Bangkok, Thailand, on December 10, 1968.

BIBLIOGRAPHY

The authorized biography of Thomas Merton, Michael Mott's *The Seven Mountains of Thomas Merton* (Boston, 1984), is an exhaustively researched and yet readable study. It may suffer from lack of a central interpretive theme but sets a standard for subsequent work on Merton. *Merton: A Biography* by Monica Furlong (New York, 1980) is a reliable account, although little attention is given to Merton's monastic vocation or his involvement with Asian spirituality. *Thomas Merton: Monk and Poet*, by George Woodcock (New York, 1978), is a perceptive analysis of the creative dynamics in Merton's literary work. The author, himself a poet and novelist, is sensitive to the religious dimension of Merton's life. My own book, *The Human Journey: Thomas Merton, Symbol of a Century* (New York, 1982), draws out the correlations between Merton's personal life and the tensions and aspirations of the twentieth century. It traces the appeal of Merton to his capacity to assimilate the problems and promise of his own time.

MESOAMERICAN RELIGIONS: PRE-COLUMBIAN RELIGIONS

Through several millennia and up to the present, complex forms of indigenous belief and ritual have developed in Mesoamerica, the area between North America proper and the southern portion of isthmian Central America. The term *Mesoamerica*, whose connotation is at once geographical and cultural, is used to designate the area where these distinctive forms of high culture existed. There, through a long process

of cultural transformation, periods of rise, fall, and recovery occurred. On the eve of the Spanish invasion (1519), Mesoamerica embraced what are now the central and southern parts of Mexico, as well as the nations of Guatemala, Belize, El Salvador, and some portions of Honduras, Nicaragua, and Costa Rica.

Distinctive forms of social organization began to develop in this area from, at the latest, the end of the second millennium BCE. Parallel to these social and economic structures, various forms of religion also flourished. Most contemporary researchers agree that Mesoamerican religion, and the Mesoamerican high cultures in general, developed without any significant influence from the civilizations of Asia, Europe, and Africa. But whereas it is generally accepted that the various forms of high culture that appeared in Mesoamerica shared the same indigenous origin, a divergence of opinions exists regarding the question of how the various religious manifestations are ultimately interrelated.

According to some scholars (e.g., Bernal, 1969; Caso, 1971; Joralemon, 1971, 1976; Léon-Portilla, 1968; Nicholson, 1972, 1976), there was only one religious substratum, which came to realize itself in what are the distinct varieties of beliefs and cults of peoples such as the Maya, the builders of Teotihuacan, the Zapotec, the Mixtec, the Toltec, the Aztec, and others. A different opinion (maintained by, among others, George Kubler [1967, 1970]) postulates the existence of various religious traditions in ancient Mesoamerica. Those adhering to this view nonetheless admit to reciprocal forms of influence and even to various kinds of indigenous religious syncretism.

This essay on pre-Columbian religions postulates the existence of what is essentially a single religious tradition in Mesoamerica, without, however, minimizing the regional differences or any changes that have altered the continuity of various elements of what can be labeled "Mesoamerican religion" (Carrasco, 1990).

The assertion about the existence of a single religious tradition rests on various kinds of evidence:

1. All over Mesoamerica there were identical calendrical systems which guided the functioning of religious rituals in function of which religious rituals were performed.
2. The Mesoamerican pantheon included a number of deities that were universally worshiped, including the supreme Dual God, Our Father our Mother; an Old God known also as God of Fire; a Rain god; a Young God of Maize; Quetzalcoatl, Kukulcan, god and priest; a Monster of the Earth; and others. The gods also had calendrical names.
3. Rituals performed included various kinds of offerings such as animals, flowers, food and human sacrifices.
4. Self-sacrifice also played an important role.
5. There was a complex priestly hierarchy.
6. The temples were built in a basically similar architectural pattern, truncated pyramids with sanctuaries on top.

7. Recorded texts show the existence of a similar world-view, which included the sequence of several cosmic ages and spatial symbols such as cosmic trees, birds, colors, and deities.

EARLIEST RELIGIOUS MANIFESTATIONS. Because of lack of evidence, scholarship does not extend back to the religious concerns of the earliest inhabitants of Mesoamerica (c. 25,000 BCE). Nevertheless, some archaeological findings show that the early hunter-gatherers had at least some metaphysical or religious preoccupations. Reference can be made to their rock art: paintings and petroglyphs, some of which date to about 10,000 BCE, several of which suggest religious or magical forms of propitiation through hunting, fishing, and gathering.

Objects that are more obviously religious in function date only from 2500 to 1500 BCE, when the earliest village-type settlements appeared in Mesoamerica. By that time, after a slow process of plant domestication that probably began around 6000 BCE, new forms of society began to develop. It had taken several millennia for the hunter-gatherers to become settled in the first small Mesoamerican villages. In the evolution of Mesoamerican culture, what has come to be known as the Early Formative period had commenced.

Those living during this period employed an ensemble of objects indicative of their beliefs about the afterlife, and of their need to make offerings to their deities. At different sites throughout Mesoamerica (especially in the Central Highlands, the Oaxaca area, and the Yucatán Peninsula), many female clay figurines have been found in what were the agricultural fields. Scholars hypothesize that these figurines were placed in the fields to propitiate the gods and ensure the fertility of crops. Burials in places close to the villages (as in Asia, Africa, and Europe) also appear, with a large proportion of the human remains belonging to children or young people. These burial places are accompanied by offerings such as vestiges of food and pieces of ceramics.

OLMEC HIGH CULTURE. Villages of agriculturists and potters, who evidently were already concerned with the afterlife and with "sacred" fertility, became gradually more numerous in Mesoamerica, with the villages established in hospitable environments experiencing significant population growth. Among these, the communities in the area near the Gulf of Mexico in the southern part of the Mexican state of Veracruz and neighboring Tabasco underwent extraordinary changes around 1200 BCE. Archaeological findings in the centers now called Tres Zapotes, La Venta, and San Lorenzo reveal that a high culture was already developing and, with it, a strong religious tradition.

Olman (land of rubber), the abode of the Olmec, with its large buildings mainly serving religious purposes, stands out as the first high culture in Mesoamerica. The center of La Venta, with its mud-plastered pyramids, its semicylindrical and circular mounds, carved stone altars, tombs, stelae, and many sculptures, anticipates the more complex ensembles of religious structures that proliferated centuries later in

Mesoamerica. The central part of La Venta, built on a small island in a swampy area sixteen kilometers from the point where the Tonalá River empties into the Gulf of Mexico, was no doubt sacred space to the Olmec. The agriculturist villagers who had settled in the vicinity of La Venta were already developing new economic, social, political, and religious institutions. Although many villagers continued their subsistence activities—especially agriculture and fishing—others specialized in various crafts and arts, commercial endeavors, the defense of the group, and—of particular significance—the cult of the gods. Government at this point was most likely left to those who knew how to worship the gods.

Olmec religious iconography. Olmec religious representations have been described as “biologically impossible” (Joralemon, 1976, p. 33). Human and animal features are combined in these representations in a great variety of forms. Early researchers pointed out the omnipresence of a jaguarlike god, who seemingly had the highest rank in the Olmec pantheon. One early hypothesis stated that the main traits of what later became the prominent Mesoamerican rain god derived from these jaguarlike representations.

A more ample and precise approach to Olmec iconography has led Peter D. Joralemon (1971, 1976) and Michael D. Coe (1972, 1973) to express the opinion that the variety of presentations of the jaguarlike god portray distinct, though closely associated, divine beings. A number of divine identities integrate various animal and human attributes. The animal features most frequently used in combination with the basically human-shaped face are a jaguar’s nose, spots, and mighty forearms, as well as a bird’s wings, a serpent’s body, and a caiman’s teeth. Thus, one finds beings that might be described as a human-jaguar, a jaguar-bird, a bird-jaguar-caiman, a bird-jaguar-serpent, a jaguar-caiman-fish, a human-bird-serpent, a bird-caiman-serpent, and a bird-mammal-caiman (Joralemon, 1976, pp. 33–37).

Iconographic comparisons between representations of these kinds and other religious Mesoamerican effigies from the Classic (c. 250–900 CE) and the Postclassic periods (c. 900–1519 CE) reveal that the nucleus of the Mesoamerican pantheon was already developing in the Olmec epoch. One god is sometimes represented as a kind of dragon, frequently featuring a jaguar’s face, a pug nose, a caiman’s teeth, and a snarling, open, cavernous mouth with fangs projecting from the upper jaw, a flaming eyebrow, various serpentine attributes, and at times a hand/paw/wing linked to the occipital region. Other, more abstract, motifs include crossed-band designs in the eyes, crossed bands and a dotted bracket, four dots and a bar, and the symbols for raindrops and maize.

This god, probably the supreme Olmec deity, was worshiped in his many guises, as the power related to fertility, rain, lightning, earth, fire, and water. In him, various forms of duality—an essential feature in the Classic and Postclassic Mesoamerican universe in both its divine and human aspects—can be anticipated. Prototypes of other gods that were later worshiped among the Maya, as well as the peoples

of the central highlands and those of Oaxaca, can also be identified in the Olmec pantheon. Among these are the Maize God, the One Who Rules in the Heavens, the Old Lord (protector of the sacred domestic hearth), and the Serpent, who has birdlike attributes and is a prototype of the Feathered Serpent.

Other researchers have recognized that, in addition to emphasizing the appearance of the omnipresent Olmec god as a kind of a dragon with a jaguar’s face, it must also be identified by its equally visible serpentine traits. Román Piña Chan summarizes such an interpretation:

We can say that during the period of maximum Olmec development they gave birth to new religious concepts: [. . .] rattle snake representations, or bird-serpents, that began to symbolize the god of rain or celestial water. (Piña Chan, 1982, p. 194)

Chan and others have recognized that the god with serpentine traits is the antecedent of Tlaloc, the rain god of the central plateau, known also as Chac among the Maya, and as Cocijó among the Zapotec of Oaxaca. It can be asserted that iconographic studies support this view.

The Olmec thought of their gods as endowed with interchangeable traits and attributes. Thus, a kind of continuum existed in the sphere of the divine, as if the ensemble of all the godlike forms was essentially a mere manifestation of the same supreme reality. This distinctive character of the divine—represented through ensembles of symbols, often shifting from one godlike countenance to another—perdured, as will be seen, in the religious tradition of Mesoamerica. That continuity, subject to variations of time and space, did, however, undergo innovations and other kinds of change. One important change derived from the relationship that was to develop between the perception of the universe of the divine and the art and science of measuring periods of time (i.e., the development of calendrical computations).

Origins of the calendar. The earliest evidence of calendrical computations—inscriptions discovered in places influenced by Olmec culture—also conveys other related information. Of prime importance is the indication that the political and social order was not only closely linked to the universe of the divine, but was also conceived in terms of the measurement of time—all of whose moments are bearers of destiny. In the Stelae of the Dancers (a stela [pl. stelae] is an engraved upright stone slab), at Monte Albán I (epoch I) in Oaxaca (c. 600 BCE), where Olmec influence is present, the human figures, described “as an expression of political and ritual power” (Marcus, 1976, p. 127), are accompanied by hieroglyphs denoting names of persons (probably both human and divine), place names, and dates.

The calendar was doubtless the result of assiduous astronomical observation. Its early diffusion throughout various parts of Mesoamerica implies an old origin (probably 1000–900 BCE) for this calendar that later came to determine all divine and human activities. Humans are represented in sev-

eral Olmec monuments, such as the Basalt Altar 4 in La Venta, as emerging from the mouth or cave of the supreme “dragon” deity, signifying humankind’s birth into a universe where time moves in sacred rhythms. The recurring Olmec symbols—quadruple and quintuple patternings (indicative of the four corners and the center of the earth), stylized maize plants, and other motifs—seem to reveal that a prototype of what became the classic Mesoamerican image of sacred space had been developed as far back as Olmec times.

MAYA RELIGION. Olmec civilization acted as a ferment of many cultural transformations. Archaeological research has identified the traces of its ample diffusion. In addition to the numerous sites excavated in the Olmec heartland of Veracruz-Tabasco, many villages of the Early Formative type in the Central Plateau—in the western region along the Pacific coast in Oaxaca—and in the land of the Maya, show evidence of having undergone processes of rapid change. (The Maya territories include the Yucatán Peninsula and parts of the present-day Mexican states of Tabasco and Chiapas, as well as Guatemala, Belize, and parts of Honduras and El Salvador.)

Antecedents of cultural grandeur. Some notable findings have highlighted the processes that culminated in the grandeur of Maya high culture. These findings reveal that a preoccupation with the sacred cycles of time resulted in extraordinary achievements as early as several decades BCE. One of the findings is Stele 2 of Chiapa de Corzo, Mexico, where a date corresponding to December 9, 36 BCE is expressed in what modern researchers describe as the calendar’s Long Count (see below). Two other inscriptions, registered in the same Long Count, have been found in places closer to the ancient Olmec heartland, one on Stele C at Tres Zapotes, Veracruz (31 BCE), and the other on the Tuxtla (Veracruz) Statuette (162 CE). The deeply rooted Mesoamerican tradition of measuring the flow of time, a tradition whose oldest vestiges appear in Monte Albán I, Oaxaca (c. 600 BCE), became more sophisticated around 200 to 100 BCE with the complexities and extreme precision of the Long Count. To understand its functioning and multiple religious connotations, one needs to be familiar with two basic systems—the 365-day solar calendar and the 260-day count—described later in this article.

Other vestiges that have been unearthed point to cultural changes that were taking place during this period, called the Late Formative. In the Pacific plains of the southernmost Mexican state of Chiapas and in adjacent parts of Guatemala, several centers boasted impressive religious buildings, temples, altars, stelae with bas-reliefs, and a few calendrical inscriptions. Archaeologists rightly consider these centers to be the immediate antecedents of Maya culture. The centers of Izapa, Abaj Takalik, and El Baúl contain monuments that are outstanding. Stele 2 at Abaj Takalik contains a carved image of a celestial god and an inscription of a date, which, though partly illegible, is expressed in the system of the Long Count. In El Baúl, other calendrical inscriptions correspond

to the year 36 CE. Maya culture—one of the variants of Mesoamerican civilization—was about to be born.

Stele 5 of Izapa in Chiapas is particularly remarkable; in it a vertical image of the world is represented. One sees in it the cosmic tree of the center, and at its sides, the figures of Our Father and Our Mother, as they appear on pages 75 to 76 of the Maya *Codex Tro-Cortesiano*. In the stele, two feathered serpents surround the scene, which at its bottom shows the terrestrial waters and at its top the celestial ones. This stele, as well as others from the same center and from nearby sites, provides a glimpse at the beginnings of what was to become the vision of the world and of the supreme deity in Maya culture.

Chronology and sources. A Classic period (c. 250–900 CE) and a Postclassic period (c. 900–1519 CE) have been distinguished in the cultural development of the Maya. The most magnificent of their religious and urban centers flourished during the Classic period: Tikal, Uaxactún, and Piedras Negras in Guatemala; Copán and Quiriquá in Honduras; Nakum in Belize; Yaxchilán, Palenque, and Bonampak in what is now the Mexican state of Chiapas; and Dzibilchaltún, Cobá, Kabáh, Labná, Chichén Itzá, Uxmal, Río Bec, and others in the Yucatán Peninsula. At these sites, sophisticated forms of spiritual development emerged. Even Diego de Landa, the Spanish friar who in the sixteenth century set fire to many of the written records of the Maya, could not refrain from remarking on “the number, the grandeur, and the beauty of their buildings” (Landa, trans. Tozzer, 1941, p. 170), especially those devoted to the cult of their gods. Besides Maya architecture—which included among its techniques the corbel vault—also deserving of special mention is their sculpture, mural painting, and bas-relief carving on stone stelae, stairways, lintels, panels, and plaques of jade. On them, thousands of hieroglyphic inscriptions have been found, some related to the universe of the gods and others having more mundane historical content. These inscriptions at times accompany carved images of gods as well as of rulers and other dignitaries.

To compensate for the obscurities that still surround the spiritual achievements of the Classic period, one has to look for whatever is indicative of a cultural continuity in the Postclassic. From the latter period, three pre-Columbian books—or codices—survive; and, even more significantly, a considerable number of indigenous testimonies, in Yucatec-Maya, Quiché-Maya, and other linguistic variants, have come down to us in early transcriptions done by Maya priests or sages who survived the Spanish conquest and learned to use the Roman alphabet. Among these testimonies, the *Popol Vuh* (The Book of counsel) of the Quiché-Maya, the several *Chilam Balam* books of the Yucatec-Maya, and the *Book of Songs of Dzitbalche* (from the Yucatán) stand out as conveyers of the religious wisdom of this remarkable people.

The Maya image of the world. To approach the core of the religious worldview of the Classic Maya, one has to analyze an ensemble of elements—some with antecedents in

the Olmec culture, yet enriched and often transformed. The most significant of these elements include the Mayan image of the earth and universe, their calendrical concerns and ideas about time, and the ultimate meaning of the divine and of humans within their spatial and temporal universe.

In several Classic monuments, as well as in Postclassic books and other representations, the surface of the earth is conceived as being the back of a huge caiman with saurian, ophidian, and feline attributes that sometimes resemble those of the so-called Olmec Dragon. The monstrous creature is surrounded by vast waters. In Palenque, in the Tablet of the Cross and the Tablet of the Foliated Cross, cosmic trees rise from the earth monster. In some representations, one sees a double-headed serpent in the sky. The creature also appears with other attributes of the Olmec Dragon, such as crossed bands and various celestial symbols. The double-headed serpent covers and embraces the earth. It was this celestial serpent that, dividing the terrestrial monster into two parts, activated this universe and introduced life on earth. Thus, a primeval duality presides over and gives rise to the universe.

The surface of the earth, as in the case of the Olmec prototype, is distributed into four quadrants that converge at a central point: the navel of the world. One finds in Classic inscriptions and Postclassic codices hieroglyphs for each of the world quadrants and their associated colors. Cosmic trees and deities reside in the “red east,” “white north,” “black west,” “yellow south,” and “green central point.” Above and below the surface of the earth are thirteen heavens and nine underworld levels, where thirteen celestial gods and nine “lords of the night” have their respective abodes.

MAYA DEITIES. The comparative study of religious iconography, the contents of the three extant Pre-Columbian Maya codices, and the relatively numerous texts of diverse origin within this culture allow us to surmise that the idea of a divine duality was deeply rooted in Mesoamerican thought since at least the Classic period, if not since the Olmec. The Dual God resides in the uppermost of the celestial levels. In the *Popol Vuh* of the Quiché-Maya, he-she is addressed both as E Quahalom (Begetter of Children) and as E Alom (Conceiver of Children). In the first of the *Songs of Dzitbalche* appears the following reference to the father-mother god:

The little yellowbird, and also the cuckoo, and there is the mockingbird, they all delight the heart, the creatures of the Father, god, so likewise the Mother, such as the little turtle dove. . . (Edmonson, 1982, p. 176)

Our Father Our Mother has other names as well. There is evidence to identify him-her with the Postclassic Itzamná (Lizard House), the name probably referring to the primeval celestial and terrestrial being of monstrous countenance, whose house is the universe. This supreme creator-god is invoked at times with the feminine prefix *Ix-*, as in *Ix Hun Itzam Na*. To him-her—that is, to the “begetter-conceiver of children”—the Maya ultimately attributed the creation of the earth, heavens, sun, moon, plants, animals, and, of

course, humans. As in the case of the Olmec nuclear deity, traits of caiman, bird, serpent, and jaguar can be perceived at times in the god’s iconography.

The quadruple patterning expressed in certain Olmec monuments proliferated in Maya religious representations. The divine duality, “begetting and conceiving” children, develops a quadruple being—the various ensembles of gods that have to do with the four quadrants of the universe. The Red Itzamná appears in the East, the White in the North, the Black in the West, and the Yellow in the South. Other quadruple sets are the four Bacabs, supporters of the sky at the four corners of the world; the four Chacs, gods of rain; the four Pahuatuns, deities of wind; the four Chicchans (Owners of Thunder), godlike giant snakes; and the four Balams (Tigers), protectors of the cultivated fields.

Divine reality also permeates the upperworld and underworld levels. Itzamná is at once a celestial, a terrestrial, and an underworld god. The Oxlahum-ti-ku (thirteen gods) rule in the thirteen heavens, and the Bolom-ti-ku (nine gods) preside over the nine inferior levels.

Prominent in the Maya pantheon is Kin, the sun god, who, wandering above, creates the day and the cycles of time. When he reaches his home in the West, he enters the fangs of the earth monster and journeys through the obscure regions of the underworld to reappear in the East, from the same monster’s fangs. Although the sun god himself cannot be considered the supreme deity of the Maya, his frequent association with the worlds above and below, with the four quadrants of the world, and with all the calendar’s periods makes him a multifaceted god with innumerable religious connotations. He is often related to Itzamná as a celestial deity, and also to Yum Kimil (Lord of Death) who abides in the netherworld, the region visited at night by the sun god disguised as a jaguar. The abode of Yum Kimil is also the place to which most of the dead go. Only a few dead—chosen by the Chacs, the gods of rain—attain a sort of paradise, a place of pleasure situated in one of the heavens. It is not clear whether those who go to the abode of the lord of death are to remain there forever, are eventually reduced to nothing, or if, after a period of purification, they are transferred to the celestial paradise.

Other gods worshiped by the Maya include the moon goddess Ixchel (another title of the mother goddess, often described as wife of the sun god). The “great star” (Venus), whose heliacal risings and conjunctions were of great interest to Maya skywatchers, received at times the calendrical name *I Ahau* (1 Lord), but it was also associated with five other celestial gods, whose identification implies the assimilation of cultural elements in the Postclassic from the Central Plateau of Mexico. There also appear to have been patron gods of specific occupational groups, such as merchants, hunters, fishermen, cacao growers, medicine men, ball players, poets, and musicians.

With regard to the “feathered serpent god,” a distinction has to be made. On the one hand, serpent representa-

tions—in association with bird's elements such as plumage, or with traits belonging to other animals such as the caiman or jaguar—had been extremely frequent since the early Classic period. As previously mentioned, these complex figures—sometimes described as celestial dragons, earth monsters, cosmic lizards, and so forth—are representations of gods like the Chicchan serpents, deities of rain, or of the multifaceted Itzamná. On the other hand, the idea of a particular god and culture hero, Kukulcan, corresponding to central Mexico's Quetzalcoatl (Quetzal-Feathered Serpent), was borrowed from that subarea in the Postclassic.

Priests and forms of worship. The existence of a priesthood, and of the many sacred sites and monuments reserved for the various kinds of cult, imposed a canon to be observed in the communication with the universe of the divine. The chiefs, *halach uinicoob* (true men), could perform some religious ceremonies; but for the most part, the cult of the gods was the duty of the priests. Above them was a class of high priests, who in Postclassic texts were named “rattlesnake-tobacco lords” and “rattlesnake-deer lords.” These priests were in custody of the ancient religious wisdom, the books and the calendrical computations. They were considered prophets and acted in the most important ceremonies. Of a lower rank were the *ah kinoob*, the priests whose title can be translated as “those of the sun.” Their duty was to interpret the calendrical signs, to direct the feast-day celebrations, and to “read” the destinies of humans. To some of the *ah kinoob* fell the performance of offerings and sacrifices, including human sacrifices.

Bearers of the rain god's name were the *chac* priests, assistants in the sacrifices and other ceremonies. The lowest rank was occupied by the *ah men* (performers, prayer makers), who were concerned mostly with the local forms of cult. Women who lived close to the sacred buildings assisted the priests in their duties.

Obviously, great differences existed between the ceremonies performed in the important religious centers and those that took place at a more modest level in a village or at home. Most ceremonies were preceded by different forms of fasting and continence. Thus, the gods would be appeased by their acceptance of what people were expected to offer as payment for what they had received from the gods. A recurrent belief—not only among the Maya but also in other Mesoamerican subareas—was that, in a primeval time, “when there was still night,” the gods entered into an agreement with humans: humans could not subsist without the constant support of the gods; but the gods themselves needed to be worshiped and to receive offerings.

The Maya practiced autosacrifice in various forms, as can be observed in multiple representations of both Classic and Postclassic monuments. Most often, blood was offered by passing a cord or a blade of grass through the tongue, the penis, or some other part of the body. Offerings of animals (quail, parrots, iguanas, opossums, turtles) and of all sorts of

plants or plant and animal products (copal, flowers, cacao, rubber, honey) were also frequent.

Human sacrifice was performed following various rituals. The most frequent form required opening the breast of the victim to offer his or her heart to the god. Other kinds of human sacrifice included shooting arrows at a victim tied to a frame of wood, beheading, and throwing the victim—usually a young girl or child—into a cenote (Maya, *dz'oonot*, a natural deposit of water in places where the limestone surface has caved in) or into a lake, as in certain sites in Guatemala. Human sacrifices—never so numerous among the Maya as they became among the Aztec—were performed during the sacred feasts to repay the gods with the most precious offering: the life-giving blood.

A considerable number of prayers in the Maya languages have been preserved. Among them one can distinguish sacred hymns (hymns of intercession, praise, or thanks) from those accompanying a sacrifice and from those to be chanted in a domestic ceremony.

Religion and the calendar. The calendar provided the Maya with a frame of mathematical precision, a basis for understanding and predicting events in the universe. Thus, all the sacred duties of the priests—the ceremonies, sacrifices, and invocations—were not performed at random but followed established cycles. Observation of the celestial bodies and of whatever is born and grows on the earth demonstrated that beings undergo cyclical changes. The Maya believed that if humans succeeded in discovering and measuring the cyclical rhythms of the universe, they would adapt themselves to favorable situations and escape adverse ones. The belief that the gods and their sacred forces are essentially related to the cyclical appearances and intervals of the celestial bodies—which are their manifestations—led the sages to conclude that the realm of the divine was ruled by a complex variety of cycles.

The Maya saw the manifestations or arrivals of the gods in these cycles; all the deities were thought of as being endowed with calendrical presences, and so the gods were given their respective calendrical names. As for humans, the divine presences along the counts of time could not be meaningless: they brought fate, favorable or adverse, and all dates had therefore to be scrutinized to discover the destinies they carried. This probably explains why calendrical and religious concerns became so inseparable for the Maya.

The calendar systems they employed were not a Maya invention (although they added new forms of precision to these systems). Two forms of count were at the base of the complexities of all Mesoamerican calendars. One count is that of the solar year, computed for practical purposes as having 365 days and subject to various forms of adjustment or correction. The other count, specifically Mesoamerican, is the cycle of 260 days. In it a sequence of numbers from 1 to 13 is employed. A series of 20 day names, each expressed by its respective hieroglyph, is the other essential element of the calendar.

The solar-year count and the 260-day count meshed to make it possible to give a date not only within a year, but also within a 52-year cycle, as well as in the so-called Long Count. To represent the calendar's internal structures and forms of correlation is to represent the precise mechanism that provided the norm for the order of feasts, rites, and sacrifices; astrological wisdom; economic, agricultural, and commercial enterprises; and social and political obligations. This mechanism was also the key to understanding a universe in which divine forces—the gods themselves and the destinies they wrought—became manifest cycle after cycle.

The 260-day count places the numbers 1 to 13 on a series of 20 day names, whose meanings in the Maya languages are related to various deities and other sacred realities. The 20 days have the following names and associations: *Imix* (the earth monster); *Ik* ("Wind" or "Life," associated with the rain god); *Akbal* ("Darkness," associated with the jaguar-faced nocturnal sun god); *Kan* ("Ripeness," the sign of the god of young maize); *Chicchan* (the celestial serpent); *Cimi* ("Death," associated with the god of the underworld); *Manik* ("Hand," the day name of the god of hunting); *Lamat* (day name of the lord of the "great star," Venus); *Muluc* (symbolized by jade and water, evokes the Chacs, gods of rain); *Oc* (represented by a dog's head, which guides the sun through the underworld); *Chuen* (the monkey god, the patron of knowledge and the arts); *Eb* (represented by a face with a prominent jaw; related to the god who sends drizzles and mists); *Ben* ("Descending," the day name of the god who fosters the growth of the maize stalk); *Ix* (a variant of the jaguar-like sun god); *Men* (associated with the aged moon goddess); *Cib* (related to the four Bacabs, supporters of the sky); *Caban* ("Earthquake," associated with the god/goddess of the earth); *Etz'nab* ("Obsidian Blade," linked to human sacrifice); *Cauac* (day name of the celestial dragon deities); and *Abau* ("Lord," the radiant presence of the sun god).

During the first 13-day "week" of the 260-day cycle, the numbers 1 through 13 are prefixed to the first 13 day names. At this point, the series of numbers begins again at 1, so that, for example, *Ik*, whose number is 2 during the first week, has the number 9 prefixed to it during the second week, 3 during the third week, and so on. The cycle begins to repeat itself after 260 (20 x 13) days. In this 260-day count, one also distinguishes 4 groups of 65 days, each of which is broken into 5 "weeks" of 13 days (each presided over by a particular god).

The solar count of the *haab*, or year, is divided into 18 groups—*uinals*, or "months"—of 20 days each (18 x 20 = 360), to which 5 *uayeb's* (ominous days) are added at the end of the cycle. These 18 "months" of 20 days and the 5 final days are the span of time along which the 260-day count develops. The intermeshing of the two counts implies that in each solar year there will be a repetition in the 260-day combination of numbers and day names in 105 instances (365 - 260 = 105). As the number and the day name together form the basic element to express a date, the way to distinguish between such repetitions is by specifying the position of the days in the different 18 months of 20 days of the solar count.

Thus, if the day *13 Abau* (13 Lord) is repeated within a 365-day solar count, one can distinguish two different dates by noting the day to which it corresponds in the series of the 18 months. For example, *13 Abau, 18 Tzec* (the day *13 Abau* is related to the 18th day of the month of *Tzec*) is different from *13 Abau, 18 Cumhu* (the day *13 Abau* is related to the 18th day of the month of *Cumhu*).

The number of possible different interlockings of the two counts comprises 18,980 expressions of the day name, number, and position within the month. Such a number of differently named days integrates a Calendar Round, a cycle of 52 years. Each of these 18,890 calendric combinations was designated as the bearer of a distinct divine presence and destiny, obviously not of that many different gods, but of a complex diversification of their influences—favorable or adverse—successively oriented towards one of the four quadrants of the world.

The Long Count System. But the Maya, like some of their predecessors who were exposed to Olmec influence, could also compute any date in terms of the Long Count, in which a fixed date, corresponding to a day in the year 3133 BCE (probably representing the beginning of the present cosmic age), was taken as the point of departure. The end of the Long Count's cycle will occur on a date equivalent to December 24, 2011. The Long Count was conceived to express dates in terms of elapsed time, or *kin* (a word that has cognates throughout the Maya family of languages and that means "sun, sun god, day, time, cosmic age"). Periods within the Long Count were reckoned in accordance with Mesoamerican counting systems, which employed base 20. These periods, each of which had its presiding deity, were registered in columns of hieroglyphs, beginning with the largest cycle, as follows:

Baktun (7,200 days x 20 = 144,000 days) *Katun* (360 days x 20 = 7,200 days) *Tun* (20 days x 18 = 360 days)
Uinal (20 days) *Kin* (1 day)

By means of their dot, bar, and shell—numerical signs for 1, 5, and 0, respectively—the Maya indicated how many *baktuns*, *katuns*, *tuns*, *uinals*, and *kins* had, at a given moment, elapsed since the beginning of the present cosmic age. The date was finally correlated with the meshed system of the 365-day solar calendar and the 260-day count, which thus became adjusted to the astronomical year.

Besides these precise forms of calendar, the Maya developed other systems devised to measure different celestial cycles, such as those of the "great star" and of the moon. The inscriptions on Maya stelae allow us to understand some of the main reasons for their astronomical and calendrical endeavors. To the Maya, dates conveyed not only the presence of one god on any given day, but also the sum total of the divine forces "becoming" and acting in the universe. The deities of the numbers, of the day names, of the periods within the 260-day count, of the *uinals* (or months of the year), and of the divisions within a 52-year cycle—as well as of the

many other cycles within the Long Count system—converged at any given moment and exerted their influences, intrinsically coloring and affecting human and earthly realities.

Through color symbolism and indications like those of the “directional hieroglyphs of the years,” one can identify the cosmic regions (quadrants of horizontal space and also celestial and inferior levels) to which specific cycles and gods address their influence. For the Maya, space separated from the cycles of time would have been meaningless. When the cycles are finally completed, the consequence will be the end of life on earth, the death of the sun, the absence of the gods, and an ominous return to primeval darkness.

The priests known as *ah kinoob* (those of the sun and of the destinies) whose duty was to recognize and anticipate the divine presences, as well as their beneficial or dangerous influences, were consulted by rich and poor alike. Thanks to special rites and sacrifices, favorable destinies could be discovered that would neutralize the influence of adverse fates. In this way one escaped fatalism, and a door was opened to reflection and righteous behavior. The wisdom of the calendar was indeed the key to penetrating the mysterious rhythms of what exists and becomes. This probably explains why the priests were also interested in the computation of dates in the distant past. On Stele F of Quirigua is inscribed a date, *1 Ahau, 18 Yaxkin*, that corresponds to a day 91,683,930 years in the past!

In the Postclassic period, the Long Count fell into oblivion and the simplified system of the Count of the *Katuns* (13 periods of 20 years) was introduced. The destinies of the *katuns* remained an object of concern and a source of prophetic announcements. In spite of the Spanish Conquest, the burning of the ancient books, and the efforts of Christian missionaries, elements of the ancient worldview and religion have survived among the contemporary Maya, as has been documented by the ethnographer Alfonso Villa Rojas (León-Portilla, 1973, pp. 113–159).

Epigraphy and religion. For a long time, the reading of the Maya inscriptions in monuments, codices, and other objects was limited (for the most part) to the calendar’s registrations and the names of some gods and feasts. In the 1950s the Russian Yuri Knorosov made a basic contribution that opened the entrance into the realm of Maya inscriptions. In opposition to the opinion of well-known scholars such as Günter Zimermann and J. Eric S. Thompson, who insisted upon the ideographic nature of Maya writing, Knorosov asserted its basically phonetic character.

Knorosov’s Rosetta Stone was found in Friar Diego de Landa’s *Relación de Yucatán*, where a supposed Maya alphabet was included. Knorosov carefully analyzed de Landa’s work and reached the conclusion that, far from dealing with an alphabet, he was confronted with a syllabary. Further research led him to identify a large number of syllables as well as glyphic markers of morphological relations (Coe, 1992).

Following Knorosov’s steps, a growing number of Mayists, including American, Mexican, and European scholars, have advanced in deciphering a writing that for centuries remained a mystery. As a result, readings of many inscriptions have been achieved that provide a better understanding of the religion and history of the Maya. Whereas in the past it was thought that most of the inscriptions were of calendrical and astronomical nature, today it is recognized that they provide first-hand information on the dynasties of the rulers and their deeds, and on their relations with the gods and the realm of the beyond.

Linda Schele, Mary Ellen Miller, and David Freidel have made substantial contributions in this respect. Their books, *The Blood of Kings: Dynasty and Ritual in Maya Art* (1986), and *A Forest of Kings: The Untold Story of the Ancient Maya* (1990), offer readings that have unveiled the dynastic sequences of those who ruled in a good number of Maya centers. With respect to the religion, these authors have revealed the various ways in which the Maya conceived of the relationship of their *Ahauob* (lords or rulers), and the people in general, with the universe of the gods and ultimate realities.

The readings of hundreds of inscriptions and the iconographic approaches to the inscriptions’ accompanying imagery carved into panels, lintels, stelae, and other monuments and objects—as well as the unveiling of the architectural planning of the temples, palaces, and ballcourts situated close to great plazas—has led to a better understand of how the Maya maintained the relationship between the rulers and the universe of the gods.

Cerros, an important Maya center near the mouth of a river that empties into the Bay of Chetumal in the southern part of the Yucatán Peninsula, appears as one of the earlier sites where, kinship having been formally established, new religious symbols and rites were introduced. Pyramids were erected on broad platforms; a stairway was built to reach the summit of the temple; and below, in the open space of the great plaza, the people would attend the rituals performed on top of the pyramid. There, the *ahau*, or high ruler, would proceed towards the front door of the temple—he was about to leave earthly space to penetrate the realm of the divine.

A ritual represented in several monuments, that of self-bloodletting was practiced by the *ahau*. The imagery and inscriptions carved in dintel 25 from a temple of Yaxchilan in Chiapas illustrate the performance and meaning of such ritual. One sees there a kneeling noblewoman, Lady Xoc. She holds in her hands obsidian lancets, a spine, and bloodied paper. She is looking upwards, contemplating the vision of a great serpent; she is having a revelation. Lady Xoc is recalled in the lintel in commemoration of the accession to the throne of Yaxchilan of the Lord Shield Jaguar.

Scenes like this one of self-bloodletting are not rare in several Maya centers. These scenes represent the ritual by which nobles would pay the gods for their creation and accession to a throne from which they were destined to rule in permanent communion with the gods.

Among other forms of representation of the relation of the *abauob* with the gods, there is one in which a perdurable life for the rulers is asserted and parallels are established between the rulers and the deities. This is the case with a carved panel from temple 14 of Palenque. Its imagery includes the effigy of Chan Bahlum dancing after his victory over the Lords of Xibalbá (the underworld). His mother, Lady Ahpo-Hell, welcomes him, lifting an image of the god Ah Bolon Tzacab, a primordial deity that has been described as the Maya equivalent to the Nahua god Tezcatlipoca.

The inscription on the left side of the panel registers the date in which the tablet was erected: a day *9 Ik* and the month *10 Mol*, corresponding to November 6, 705 CE. Lord Chan Bahlum had died three years before. On the right side, the inscription correlates the event represented with happenings that took place in a previous cosmic age, more than nine hundred thousand years before. The mother of Chan Bahlum, also represented in the tablet, “is likened to Moon Goddess” (Schele and Miller, 1986, p. 272).

Those who rule—the *abauob*—are likened to the gods, and it is on them that the people depend. The *abauob* are in communion with the Otherworld, and this is why their memory shall be kept. Rulership and royal dynasties were thus forever linked to the ritual and beliefs of the Maya.

ZAPOTEC AND MIXTEC RELIGIOUS VARIANTS. Mountain ranges that encompass several valleys, as well as the slopes that lead to the Pacific plains in the Mexican state of Oaxaca, have been the ancestral abode of the Zapotec, Mixtec, and other indigenous peoples. The Zapotec reached their cultural zenith in the Classic period, whereas the Mixtec achieved hegemony during the Postclassic period. Although linguistically different, the Zapotec and the Mixtec were culturally akin. Olmec culture had influenced the Zapotec since the Middle Formative period.

Zapotec religion. From 200 to 800 CE, the Zapotec developed forms of urban life and built magnificent religious buildings in their towns (Monte Albán, Yagul, Zaachila). Their sacred spaces included large plazas around which the temple-pyramids, altars, ball courts, and other religious monuments were raised.

Mainly through what has been discovered in subterranean tombs near the temples, reliable information can be offered about Zapotec gods and other beliefs. In paintings preserved on the walls of the tombs, prominent members of the Zapotec pantheon appear, accompanied at times by inscriptions. Pottery—urns in particular—also tell about the attributes of the Zapotec gods and their ideas of the afterlife.

As in the case of the Maya, a supreme dual god, Pitao Cozaana-Pitao Cochaana, presided over all realities, divine and human. Addressed as a single god, he-she was Pije-Tao (Lord of Time), principle of all that exists. Godly beings often appear with the symbolic attributes of the serpent, bird, caiman, and jaguar—motifs also familiar to the Olmec and Maya. Cocijo, the rain god, also had a quadruple form of presence in the world. Pitao Cozobi was the god of maize.

Zapotec writing (since its early beginnings in Monte Albán 1, c. 600 BCE) appears to be the source of the forms of script later developed by the Mixtec and transmitted to the groups of central Mexico. The study of Zapotec writing reveals their calendrical concern.

Zapotec pottery urns, used mostly as containers of water, were placed near the dead in the tombs. Most of the urns include the molded representation of a god—often the rain god Cocijo. The headdress of the god conveys his emblem, in which the combined traits of serpent, jaguar, and bird are often visible.

It is known that the Zapotec of the Classic period believed in a supreme dual god. They also worshiped several deities revered in other Mesoamerican areas. The Zapotec were so much concerned with death that they placed their dignitaries’ remains in sumptuous tombs close to their temples. The Zapotec also knew about time computations.

Mixtec religion. The Mixtec founded new towns, and they conquered and rebuilt places (c. 1000 CE) in which the Zapotec had ruled. The Mixtec were great artists, excelling in the production of metal objects, many of which bear religious connotations. Several Mixtec books of religious and historical content have survived. These books constitute one of the most precious sources of the cultural history of a Mesoamerican subarea.

In the Mixtec books known as *Codex Selden* and *Codex Gómez de Orozco*, an image of the Mixtec worldview is offered. It is a worldview that closely corresponds to that of the Maya: the earth is represented by the monstrous animal with traits of caiman, serpent, and jaguar; below it is the underworld; while above the earth nine levels of the upperworld (not thirteen as in the Maya worldview) are represented. The sun and the moon and the stars are there. The dual god, with the symbols of time and of his-her day names, resides on the uppermost level.

According to other traditions, this dual god caused the earth to rise out of the waters. Later he-she built a beautiful place on the top of a large rock. The children he-she engendered and conceived are the gods of the various quadrants of the world—the gods of rain and wind, gods of maize, and so on. According to Mixtec belief, the earth and the sun had been destroyed several times; the Mixtec believed the gods waged combat in a celestial ball court. (This is represented in a gold pectoral found with other religious objects in Tomb 7 within the sacred space of Monte Albán, the site that had been built by the Zapotec but that was later conquered by the Mixtec).

Another extraordinary Mixtec book, known as *Codex Vindobonensis*, conveys the beliefs of this people about their origins in the present cosmic age. They had come from a place called Yuta Tnoho (River of the Lineages). There they were born from a cosmic tree. The Mixtec calendar systems corresponded to the 260-day count and the 365-day solar year computed by the Zapotec and the Maya. (Caso, 1965, pp. 948–961).

TEOTIHUACAN. As in the Maya and Oaxaca areas, some Early Formative–type villages in the Central Plateau experienced important changes. Places like El Arbolillo, Zacatenco, Tlatilco, Cuicuilco, and others received the ferment of Olmec influence. Special areas began to be reserved for religious purposes; temple pyramids and round platforms were built. Clay images of the fire god Huehuetotl (Old God), who much later was also worshiped by the Aztec, have been dated to the Late Formative period (c. 500 BCE).

In Tlapacoya, not far from where Teotihuacan was to be established, another important Late Formative center flourished (c. 300–100 BCE). Here, temple pyramids, tombs, and mural paintings anticipate, in many respects, what was to be the grandeur of Teotihuacan.

Teotihuacan (“the place where one becomes deified”) marks the Classic period’s climax in the Central Plateau. Archaeological research has revealed that it was here that whatever is implied by the idea of a city became a reality. It took several centuries (100–500 CE) for generations of priests and sages to conceive, realize, modify, enlarge, and enrich the city, which probably was planned to last forever. Beside the two great pyramids of the Sun and the Moon, the Temple of the Feathered Serpent, and the Palace of the Quetzalpapalotl (quetzal butterflies), many other enclosures, palaces, schools, markets, and other buildings have been unearthed. Large suburbs, where members of the Teotihuacan community had their homes, surrounded the religious and administrative center. The pyramids and palaces were decorated with murals. Gods in the forms of human beings, fantastic serpents, birds, caimans, lizards, and jaguars, as well as flowers, plants, priests, and even complex scenes—such as a depiction of Tlalocan, the paradise of the rain god—were represented in the paintings.

Teotihuacan was the capital of a large state—perhaps an empire—the vestiges of whose cultural influence have been found in Oaxaca, Chiapas, and the Guatemalan highlands. According to annals preserved by the Aztec, “In Teotihuacan orders were given, and the chiefdom was established. Those who were the chiefs were the sages, the ones who knew secret things, who preserved old traditions” (from *Codex Matricense*, trans. Léon-Portilla, folio 192r).

The inhabitants of Teotihuacan worshiped several deities whose iconography is similar to that of gods later revered by other groups in central Mexico: the Toltec (900–1050 CE), the Acolhua, and the Aztec (1200–1519 CE). The Aztec called these gods by the following names: Tlaloc and Chalchiuhtlicue, god and goddess of the waters, who together constitute one aspect of divine duality; Quetzalcoatl (Quetzal-Feathered Serpent); Xiuhtecuhtli, the fire god; Xochipilli (The One of the Flowery Lineage); Xipe Totec (Our Lord the Flayed One); Itztlacolihqui (Stone Knife), whose traits resemble those of the Toltec and Aztec god Tezcatlipoca (Smoking Mirror); Tlahuizcalpantecuhtli, the god of the morning star, and Xolotl, the god of the evening star, who

were also aspects of the divine duality; and Yacatecutli, the god of merchants (Caso, 1966; Séjourné, 1966).

In addition to these gods, a large number of other symbols and a few hieroglyphs identified in the mural paintings, sculptures, and ceramics persisted in the corresponding Toltec and Aztec ensemble of religious expressions.

Although some researchers have dismissed the validity of comparing iconographic symbols of one culture with those of another culture from a subsequent epoch, the evidence supporting a common Mesoamerican religious tradition, and the fact that one is not dealing with isolated cases of iconographic similarity but rather with ensembles of symbols, seem valid reasons for rejecting the skepticism of those who deny this cultural interrelation. Archaeological finds have shown that Teotihuacan actually influenced Toltec and Aztec cultures, which the religious iconographic similarities are obvious.

It is reasonable to assert that the arrangement of sacred space at Teotihuacan, and the gods worshiped there, was prototypical for the future religious development of central Mexico. In part because of the relative abundance of the Postclassic historical testimonies of Toltec and Aztec cultures, scholars now have a better understanding of Teotihuacan symbols.

Aztec consciousness of Teotihuacan as the ultimate source of their own culture led Aztec to see the sacred space of the Place Where One Becomes Deified as a kind of primordial site, where, *in illo tempore*, the Fifth Sun (the present cosmic age) had its beginning. An Aztec text that describes the four previous Suns, or cosmic ages, and their successive violent destructions says about the fifth and new age, “This Sun, its day name is 4-Movement. This is our Sun, the one in which we now live. And here is its sign, how the Sun fell into the fire, into the divine hearth, there at Teotihuacan” (from *Annals of Cuauhtitlan*, trans. Léon-Portilla, folio 77).

The Aztec myth about the beginning of the Fifth Sun at Teotihuacan tells how the gods met there to discuss the remaking of the sun and moon, and of human beings and their sustenance. “When there was still night,” the text relates, the gods gathered for four days around the divine hearth at Teotihuacan to determine which god would cast himself into the fire and thus become transformed into the sun. There were two candidates, the arrogant Tecuciztecatl (Lord of the Conch Shells) and the modest Nanahuatzin (The Pimpily One). Tecuciztecatl made four attempts to throw himself into the flames, but each time he backed away in fear. Then it was Nanahuatzin’s turn to try. Closing his eyes, he courageously hurled himself into the fire, was consumed, and finally appeared transformed as the sun. Tecuciztecatl, fearful and too late, was only able to achieve transformation into the lesser celestial body, the moon.

To the surprise of the other gods, the sun and moon did not move. The way to solve this problem was through sacrifice. To give the sun energy, the gods sacrificed themselves,

offering their blood, a primeval act that had to be reenacted by humans—for it is only through the bloody sacrifice that the sun and life exist; only through the sacrifice of human blood could existence be prolonged. With their own blood, human beings had to repay the divine sacrifice that had prevented the cataclysms that put an end to previous suns. Here was the seed that later flowered as the Aztec rituals of human sacrifice.

QUETZALCOATL AND TOLTEC RELIGION. It appears that Teotihuacan came to a sudden, and still unexplained, end around 650 CE. Its collapse, however, did not mean the death of high culture in Mesoamerica. From among those cultures that inherited numerous cultural elements from the Classic glory of Teotihuacan, the city of Tula stands out. Tula is about eighty kilometers north of Mexico City. Its name, Tula, means “large town, metropolis,” which is what the Toltec, following the advice of their high priest Quetzalcoatl, actually built.

Quetzalcoatl, a legendary figure, was believed to have been a king who derived his name from that of the “feathered serpent god,” in whose representations two of the pan-Mesoamerican iconographic elements—the serpent and the plumage of the quetzal—became integrated. It is said that Quetzalcoatl, while still young, retired to Huapalcalco, a village not far from Teotihuacan, to devote himself to meditation. He was taken there by the Toltec to serve as their ruler and high priest.

Native books attribute to him whatever is good and great. He induced his people to worship benevolent supreme dual god, Ometeotl. This same god was also invoked as the Precious Feathered Serpent or Precious Feathered Twins. Both meanings are actually implied by the term *Quetzalcoatl*, at once the name of the god and that of his priest. The original Toltec text says,

And it is told, it is said,
That Quetzalcoatl invoked, took as his God,
The One in the uppermost heaven:
She of the starry skirt,
He whose radiance envelops things;
Lady of Our Flesh,
Lord of Our Flesh;
She who is clothed in black,
He who is clothed in red;
She who endows the earth with solidity,
He who covers it with cotton.
And thus it was known
That toward the heavens was his plea directed,
Toward the place of duality,
Above the nine levels of Heaven. (from *Annals of Cuauhtitlan*, trans. Léon-Portilla, folio 4, 1995)

The dual god Ometeotl—who in the night covers his-her feminine aspect with a skirt of stars, but who during the day reveals himself as the sun, the greatest of the light-giving stars—appears also as the Lord and Lady of Our Flesh, as he-she who vests himself-herself in black and red (colors

symbolizing wisdom), and, at the same time, as the one who gives stability to the earth. Thus the priest taught the Toltec how to draw near to Ometeotl-Quetzalcoatl, the god who dwells in the uppermost heaven:

The Toltec were solicitous of the things of God; they had but one God; they held him to be their only God; they invoked him; they made supplications to him; his name was Quetzalcoatl. The guardian of their God, their priest, his name was also Quetzalcoatl. And they were so respectful of the things of God that everything that the priest Quetzalcoatl told them they did, and they did not depart from it. He persuaded them; he taught them: This one God, Quetzalcoatl is his name. He demands nothing except serpents, except butterflies, which you must offer to him, which you must sacrifice to him. (from *Codex Matritense*, trans. Léon-Portilla, folio 179r.)

The Toltec understood the doctrine of Quetzalcoatl. Under his guidance they were able to relate the idea of the dual god with the ancient image of the world and the destiny of man on earth. *Codex Matritense* is clear on this point:

The Toltec knew that the heavens are many; they said that there are thirteen divisions, one upon the other. There abides, there lives the True God and his Consort. The Heavenly God is called the Lord of Duality, and his Consort is called Lady of Duality, Heavenly Lady. Which means: He is king, he is lord over the thirteen heavens. Thence we receive our life, we men. Thence falls our destiny when the child is conceived, when he is placed in the womb. His fate comes to him there. It is sent by the God of Duality. (From *Codex Matritense*, trans. Léon-Portilla, folio 175v)

The golden age of the Toltec produced all sorts of achievements: palaces and temples were built; many towns and peoples accepted the rule of Quetzalcoatl. Only some enemies—most likely religious adversaries—attempted to bring about the downfall of that age. Some texts speak of the appearance of one named Tezcatlipoca, the Smoking Mirror, a god who came to Tula to force Quetzalcoatl to abandon his city and his followers. According to these accounts, the departure of the wise priest precipitated the ruin of Tula. Other texts speak of two different critical moments. The first was that of the flight of Quetzalcoatl. Although tragic, it did not bring about the complete downfall of Tula. The second crisis took place several decades later. Huemac was the king ruling at that time. His forced departure and death, around 1150, marked the total collapse of Tula. The ruin of the Toltec also meant a diffusion of their culture and religious ideas among various peoples, some distant from Tula. The existence of the Toltec is recorded in annals such as those of the Mixtec of Oaxaca and the Maya of Yucatán and Guatemala.

Henry B. Nicholson has written an excellent volume on Quetzalcoatl. Originally written as a Ph.D. dissertation and presented at Harvard University in 1957, this work has retained its value as “the most thorough and insightful analysis of a large part of Mesoamerican ensemble of primary

sources ever done in a single volume” (Carrasco and Matos Moctezuma, 2001, VI). It was revised by Nicholson and published in 2001 as *Topiltzin Quetzalcoatl. The Once and Future Lord of the Toltecs*.

Nicholson analyzes a large number of primary sources from Central Mexico (Nahuatl and non-Nahuatl); from Oaxaca (Mixtec and Zapotec); and from Chiapas and Guatemala, Tabasco-Campeche, as well as the Yucatán (Maya); and he elaborates on interpretations of the data presented. One can assert that his book, although by now several decades old, remains a fresh and relevant approach to the complexities surrounding the figure of Quetzalcoatl, a subject that in many forms permeates Mesoamerican religion and ethnohistory.

While Quetzalcoatl is an extremely important figure in the history of Mesoamerica, he has been the subject of several divergent interpretations (see Nicholson 2000 and Carrasco 2003).

On the one hand, attending to the meaning of his name, “Feathered Serpent,” it can be inferred that he was worshipped in Teotihuacan since the Classic period. There, at the so-called Temple of Quetzalcoatl, one can see heads of serpents with quetzal feathers.

Quetzalcoatl was also the name of a prominent priest and sage, portentously conceived by his mother, who lived in Tula-Xicotitlan in the ninth century. A legendary figure, he had taken his name from that of the “feathered-serpent god” and became the ruler and guide of the Toltec.

THE AZTEC RELIGIOUS VARIANT. By the end of the thirteenth century CE, new chiefdoms existed in central Mexico. Some were the result of a renaissance in towns of Toltec or Teotihuacan origin. Others were new entities made up of the cultures of semibarbarian groups from the north (the so-called Chichimecs) and the remnants of Toltec civilization.

At the same time, other peoples made themselves present in the Central Plateau. Their language was Nahuatl, the same that the Toltec had spoken. The various Nahuatlan groups—among them the Aztec, or Mexica—had been living in northern outposts, on the frontier of Mesoamerica. In the Nahuatlan texts they repeat, “Now we are coming back from the north. . . .” The Aztec return (or, as it is often described, their “pilgrimage”) was a difficult enterprise. They had to overcome many hardships until finally they were settled (c. 1325 CE) on the island of Tenochtitlan (in the lake that then covered a large part of the Valley of Mexico). It took the Aztec a century to initiate the period of their greatness in Mesoamerica.

Cultural and religious heritages. The Aztec’s world-view, beliefs, and cultural forms, which by the time of Aztec hegemony were already fully integrated as elements of their own culture, had diverse origins. The Aztec preserved ancient traditions that were the common inheritance of many peoples of Mesoamerica, such as the worship of the “Old God,” Huehuetotl, who had been revered since several hun-

dred years before the beginning of the common era. Other beliefs and practices were probably derived from the cultures that had flourished along the coast of the Gulf of Mexico, such as the veneration of Xipe Totec (“Our lord the flayed one”), a god of fertility.

Some deities, such as Tlaloc, Chac, or Cocijo (different names of the rain god, whose presence in Mesoamerica since the Classic period is amply manifested in the archaeological evidence), also became members of the Aztec pantheon. So did the two Toltec gods Quetzalcoatl and Tezcatlipoca. Besides individual gods and ensembles of gods, Aztec culture incorporated the old Mesoamerican spatial image of the world, with its four quadrants, central point, and upperworld and underworld levels (as well as the symbolic meanings attached to these divisions), and it integrated the solar calendar, the 260-day count, and the Mesoamerican system of writing.

To this heritage, the Aztec’s own beliefs must be added. Among these are the Aztec patron gods Huitzilopochtli (Hummingbird of the South, or Hummingbird of the Left) and Coatlicue (She of the Skirt of Serpents).

Consciousness of divine destiny. Aztec accounts speak of the place in the north from which they had come, Aztlán Chicomoztoc (The Place of the Herons, or The Place of the Seven Caves). There they had been oppressed by a dominant people. One day, the “portentous god,” Tezcatlipoca, spoke to the Aztec high priest, Huitzilopochtli. Tezcatlipoca offered to liberate the Aztec from their rulers. He would lead them to a place where they could enjoy freedom and from which they would extend themselves as conquerors into the four quadrants of the world. This he would do if the Aztec promised to be his vassals and to have him as their tutelary god. The Aztec then began their march to their promised land. On the way, Huitzilopochtli died, but the spirit and power of Tezcatlipoca entered into Huitzilopochtli’s bones, and from that moment on the god and the priest were one person. When the Aztec, in their search for their predestined land, arrived at Coatepec (Mountain of the Serpent), they learned that the mother goddess Coatlicue was present there and that their own god Huitzilopochtli was to be miraculously reborn as Coatlicue’s son. Huitzilopochtli’s birth occurred at the precise moment when another goddess, Coyolxauhqui (She of the Face Painted with Rattles), was about to kill Coatlicue because of the offense Coatlicue had caused her and her four hundred brothers, the Warriors of the South, when it became known that Coatlicue was inexplicably pregnant. As Coyolxauhqui and her four hundred brothers were climbing Coatepec, Huitzilopochtli was born to Coatlicue, and he immediately used his weapon, the Fire Snake, to hurt Coyolxauhqui and to cut off her head. He then pursued the Warriors of the South, driving them off the top of the mountain and destroying them. Huitzilopochtli stripped the four hundred brothers of their belongings and made them part of his own destiny. Later, when the Aztec had established themselves on the island of México-

Tenochtitlan, they constructed their main temple (the so-called Templo Mayor) to Huitzilopochtli in the form of the mountain Coatepec, and there they ritually reenacted Huitzilopochtli's portentous birth. A representation of the goddess Coatlicue stood near Huitzilopochtli's shrine on top of this "pyramid mountain," as did representations of the beheaded goddess Coyolxauhqui, the Fire Snake, and the four hundred Warriors of the South. The gods' primeval confrontation was reenacted on the feast of Panquetzaliztli (When the Flags are Raised). Objects found during the excavations of the Templo Mayor (Great Temple), undertaken from 1979 through 1990, have corroborated the native texts: all of the symbols of the Mountain of the Serpent and the story of Huitzilopochtli's birth have been recovered from the temple site.

Tributary wars and the reenactment of the sacrifice at Teotihuacan. The Aztec knew the story of the sacrifice at Teotihuacan, where the gods gave their blood and lives to strengthen the "Giver of Life" (the sun) whose movement was enabled by the sacrifice. The Aztec, believing they had to imitate the gods, took on the mission of continuing to provide the sun with vital energy. They deemed themselves called to offer the sun that same precious liquid that the gods had shed, and they obtained it from human sacrifice.

As if hypnotized by the mystery of blood, the Aztec proclaimed themselves the chosen People of the Sun. Ceremonial warfare—the principal manner of obtaining victims for the sacrifice—became the dominant activity in the Aztec's social, religious, and national life. Thus, they developed what can be described as a mystical imperialism: they devoted themselves to conquest in their effort to maintain the life of the sun and to keep the age of 4 Movement alive. The theme of war in Aztec visual art and in Aztec literature is everywhere linked to that of national greatness. In the primeval myth of Teotihuacan, mention is also made of the eagle and the ocelot (or jaguar), who were present at the divine hearth into which the gods had hurled themselves. Eagles and ocelots therefore became the symbols of warriors.

Fire, which had blazed in the hearth at Teotihuacan, and water, without which nothing green grows on earth, were strangely linked in the minds of the priests. Jointly, fire and water conveyed the idea of the mystical warfare that makes the life of the universe possible. *Atl/tlachinolli* (water/fire), *quauhili/ocelotl* (eagle/ocelot), *mitl/chimalli* (arrow/shield), *yaoxochitl/xochiaoctli* (flowery wars/flowery liquor), *quauhili/nochtli* (eagle/prickly pear, or the sun/the red heart): these are some of the binary forms of symbolic expression that recur in Aztec hymns, chants, and discourses and echo the Aztec's official worldview:

From where the eagles rest, From where the ocelots are exalted,
The Sun is invoked. Like a shield that descends,
So does the Sun set. In Mexico night is falling, War rages on all sides.
O Giver of Life! War draws near, Proud of itself Is the city of México-Tenochtitlan.
Here no one fears to die in war. This is our glory. This your command,
O Giver of Life! (Cantares Mexicanos, trans. by León-Portilla, fol. 19 v.)

Divine duality. Paintings and ideograms in some of the native books corroborate what is proclaimed in the songs of the Aztec warriors. Again, binary forms of expression—captains' headdresses in the forms of eagles and ocelots, the hieroglyphs for fire and water coupled, and so on—appear consistently related to the universe of the gods, who are essentially dual entities.

Below, in the abode of the dead, reign Mictlantecuhtli and Mictlancihuatl, the god and goddess of that region. On the surface of the earth is Our Father-Our Mother, who is at once the Old Lord, He-She of the Yellow Face, and Creator of Fire. And above, in the various celestial levels, other dual divine manifestations exist: Tlaloc and Chalchiuhtlicue (god and goddess of rain and of the terrestrial waters); the precious twins Quetzalcoatl and Cihuacoatl (the feathered serpent and the female serpent); Tezcatlipoca and Tezcatlanextia (the mirror that obscures things and the mirror that makes them brilliant); and, above all other deities, the dual god Ometeotl, a supreme being endowed with both male and female countenances.

In both Aztec and Maya religion, the Dual God, in an unfolding of his-her own being, gave birth to four sons, who are primordial divine forces. In Aztec thought these are known as the four Tezcatlipocas—White, Black, Red, and Blue—who presided over the successive cosmic ages. Their actions connoted confrontations between opposing forces as well as diverse kinds of alteration and becoming. Tezcatlipoca sometimes appears as the adversary of Tlaloc, at other times of Quetzalcoatl. Tezcatlipoca also often becomes identified with other deities—as in the story related above of Huitzilopochtli's transformation.

An iconographic analysis of the Aztec gods confirms that they shared the attribute of "divine becoming"—that is, of procession through a series of transformations. There are representations in which this "divine becoming" is evident, where, for example, Tlaloc, the rain god, is portrayed as if he were Tlahuizcalpantecuhtli, the god of the morning star; Mictlantecuhtli, the god of death; or Xochipilli, the god of dance and song. This "becoming" of the gods was linked to the Aztec canon of religious celebrations. Abundant information about the feasts along the 365-day calendar can be found in several of the indigenous texts: the *Borbonicus*, *Matritense*, *Florentine*, *Magliabecchianus*, *Tudela*, *Ixtliuochitl*, *Telleriano-Remensis*, and *Vaticanus A* codices.

SACRIFICE AND OTHER RITES. Penance, abstinence, and the offering of a variety of animals and vegetables were frequent in Aztec celebrations. Intonation of sacred hymns was accompanied by music and dances. More than any other Mesoamerican people, the Aztec practiced human sacrifice during their celebrations. A sort of perpetual drama developed in which the primeval events were reenacted, with the victims playing the roles of the gods who *in illo tempore* offered their blood to make life on earth possible. The forms of human sacrifice were similar to those that had been practiced

by the Maya. The largest number of sacrifices took place at the Templo Mayor at the center of México-Tenochtitlan.

Afterlife. Some manners of dying promised glorious destinies: death in battle, death while trying to take captives, the death of a sacrificial victim, and the death of a woman in childbirth (while bearing a future warrior). To die in any of these ways meant that one would travel, after death, to the House of the Sun, to be his-her companion in the heavens. Persons chosen by the rain god for a special kind of death (by drowning, being struck by lightning, or through a serious disease such as dropsy) were destined to enjoy Tlalocan, the rain god's paradise. Others of the dead were said to go to Mictlan (the place of the dead), which was also known as Ximoyan (the place of the fleshless) and Tocempopolihuiyan (our common destination, where we lose ourselves).

Doubt and skepticism. In contrast to the officially accepted beliefs, there are some indigenous texts from the Aztec epoch in which doubts are expressed. A conviction that the mystery that surrounds human existence will never be completely unveiled appears again and again in these compositions. These beautiful poems, written by the sages (*tlamatinime*, "those who know something"), at times convey pessimism and even a sort of natural skepticism. Their core question seems to be whether or not it is possible to say true words about the beyond, the universe of the gods, or one's survival of death. The following example is eloquent:

Even if we offer the Giver of Life Jade and precious ointments,
If with offering of necklaces You are invoked,
With the strength of the eagle and the jaguar,
With the force of the warriors, It may be that on earth
No one speaks of truth. (from *Cantares Mexicanos*,
trans. by León-Portilla, folio 13r)

The contrast between the official religious militarism of the Aztec and the questionings of these sages seems to reflect the vitality of the spiritual world of Mesoamerica.

The Templo Mayor. Testimonies that encompass the history of a single monument are seldom found in the available Mesoamerican sources. In the case of the Aztec Templo Mayor, a good number of testimonies permit the interpretation of the many symbols incorporated into it during its successive enlargements. The testimonies include pictorial manuscripts of indigenous provenance, some of them produced a few decades after the destruction of the temple as a consequence of the Spanish Conquest. There are, as well, texts in Nahuatl derived from the native orality and put in written form by means of the Latin alphabet by Nahua scribes. To this, one has to add descriptions in Spanish done by several friars and others interested in the subject.

Among the testimonies thus produced are descriptions of the Templo Mayor; of its various buildings; of the sacrifices and ceremonies held therein; of the sacred hymns that were entoned and the prayers that were recited; and, in sum, copious references about what the temple was and how it functioned as the most important precinct dedicated to the cult of the Aztec gods.

It can be asserted that the Templo Mayor was conceived as a plastic representation of the Coatepetl or "Mountain of the Serpent," situated near Tula—the ancient Toltec metropolis—where the Aztec patron god Huitzilopochtli was born. His shrine was built on top of the pyramid. Close to it, a sculpture of Huitzilopochtli's mother, the goddess Coatlicue, was placed. At the bottom of the same pyramid the Aztec placed the effigy of Coyolxauhqui, the rebel sister of Huitzilopochtli. She appeared beheaded and dismembered by her brother who, once born, resisted her attack and killed her with his invincible weapon, the Xiuhcoatl (Fire Serpent). A stone sculpture of the Xiuhcoatl stood near the shrine of Huitzilopochtli. This complex of symbols, repeated in each enlargement of the temple, corresponds to what is proclaimed in a Nahuatl hymn that recalls the birth of Huitzilopochtli.

The Aztec reenacted Huitzilopochtli's portentous birth on the feast of Panquetzaliztli (Raising of Banners). A young warrior representing Huitzilopochtli carried his image, and he would have to fight in front of the temple against Coyolxauhqui and her allies. The young warrior's victory symbolized the triumph of the Sun against the forces of the night.

A shrine dedicated to Tlaloc, the rain god, was placed on top of the twin pyramid close to that of Huitzilopochtli (both pyramids were built on a common platform to symbolize divine dualism). Tlaloc, although called by various names, was a universally worshiped god in Mesoamerica. By placing his adoratory side by side with that of Huitzilopochtli, the Aztec were proclaiming at once their veneration to their own tutelary god and also to the one omnipresent in Mesoamerica, known as Tlaloc in central Mexico.

The sources that describe the rituals performed in the temple along the eighteen groups, or "months," of twenty days demonstrate that Aztec religious beliefs and practices somehow centered upon two temporal axes. One was that of *Tonalco*, "the time of the heat and the Sun"; the other was *Xopan*, "the time of verdor," when water abounds. In both periods, however, Huitzilopochtli and Tlaloc were present, intertwined with several gods and goddesses with which they were associated. During *Tonalco*, the dry and hot season, Tlaloc and Chalchuihtlicue (the goddess of the terrestrial waters), as well as their servants, the Tlaloques, and the gods related to maize, were asked to protect the people against eventual famines. Sacrifices, including those of adults and babies, were performed in the main temple.

When the feast of Tlaxochimaco ("flowers are given") took place in the ninth "month," people went to the fields looking for flowers to celebrate the god Huitzilopochtli. Banquets, music, and dances were held in his honor. Tlaxochimaco marked the beginning of the second half the year. In the following months—and already in the rainy season—once again Huitzilopochtli, Tlaloc, and the gods of maize, salt, and fire, as well as Tonantzin (Our Mother), invoked under various names, entered the temporal and spatial scene of the Templo Mayor. Then and there the Aztec asked for

abundant harvests and would practice the sacrifices that could propitiate them.

The great temple of Mexico, Tenochtitlan had become not only an extraordinary architectural monument and precinct, as its surviving vestiges indicate; it was also a living stage where a sort of perpetual drama was played out by the Aztec. These were a people who thought of themselves as “chosen” by the primordial sacrifice of the gods and who, therefore, had to repay them in a similar form to foster the existence of their present cosmic era.

In *The Aztec Templo Mayor, a Visualization* (2001), Antonio Serrato-Combe presents computer-generated, three-dimensional color imagery of Tenochtitlan, conceived to explore the architectural configuration of the main temple and its whole precinct. The author describes his method in the book as a “digital modeling process,” and the book adds interesting contributions to what is known about the largest and most important sacred monument in Aztec Mesoamerica.

MESOAMERICAN SACRED LITERATURE. Mention has been made of the available archaeological and documentary sources for the study of Mesoamerican religion. One must also take into consideration the material that is properly labeled “Mesoamerican sacred literature.” Notwithstanding the many destructions and consequences of the Conquest, indigenous texts do exist that can be considered part of a corpus of Mesoamerican sacred literature.

A clear distinction can be made pertaining to these texts that allow the corpus to be divided into two eras: (1) those works of a pre-Spanish provenance; and (2) those texts produced after the Conquest, either as transcriptions of older testimonies or as surviving documentary manifestations of native religiosity.

The works clearly of a pre-Spanish provenance include inscriptions in monuments excavated by archaeologists, mainly from the Maya area, and some of the fifteen extant codices or “books” (i.e., those of religious content, such as codices from Central Mexico known as *Borgia*, *Vaticanus B*, *Cospi*, *Fejérváry-Máyer*, and *Laud*; those from the Maya known as *Dresden*, *Tro-Cortesiano*, *Paris*; and those from the Mixtec of Oaxaca, such as *Vindobonensis*).

Transcriptions from older documents or from the oral tradition, produced after the conquest, include the Quiché *Popol Vuh*, or Book of Council; the Maya *Books of the Chilam Balamob*; the Nahuatl *Huehuehlahitloli*, or Testimonies of the Ancient Word (the conveyors of the moral discourses, as well as the expression of the wisdom of the elders); and the collections of *Mexican Songs*, manuscripts preserved at the National Library of Mexico and the Nettie Lee Benson Latin American Collection of the University of Texas at Austin. The surviving documentary manifestations of native religiosity encompass texts like those collected in the seventeenth century by Hernando Ruiz de Alarcón in what is today the State of Guerrero.

In this corpus of Mesoamerican sacred literature one finds testimonies on the pre-Columbian religious beliefs and practices (feasts, sacrifices, and offerings); on the relationship of the gods and rituals with the calendrical computations; and on prophetic enunciations, incantations, moral precepts, prayers, hymns, and a variety of songs and poetry.

AFTER THE CONQUEST. The Spanish Conquest, which, in the case of the Aztec, was completed in 1521, brought with it the burning of native libraries, the demolition of temples, and the annihilation of whatever appeared to the conquistadors to be “idolatrous.” Nevertheless, neither the Conquest nor the zealous activity of some Christian missionaries who followed in its wake succeeded in completely erasing all of the ancient traditions. It is extraordinary to discover that contemporary Maya, Mixtec, Zapotec, Nahuatl, and other groups keep remembrances of the old mythic traditions as part of their lore.

Studies of contemporary Mesoamericans’ worldviews and religious attitudes reveals that Christianity and indigenous Mesoamerican traditions have combined to form several kinds of syncretistic systems. Whereas in some cases a Christianized paganism has developed, in others one can see that new forms of Christianity, embedded in an indigenous Mesoamerican world of symbols, have been born.

Syncretism is present among contemporary Indians and other peoples in Mexico who reinterpret the Christian dogma of the Holy Trinity partially through indigenous conceptions. For instance, instead of speaking of the Trinity or the Father, the Son and the Holy Spirit, people refer to Our Father Jesus and Our Mother, the Virgin of Guadalupe, in an implicit reference to the dual supreme god, Our Father, Our Mother. Another example of syncretism in religious practices is provided by contemporary acts of self-sacrifice that follow the admonition “to pay” for what the gods have done for us in the creation of various forms of life. Today such practices of self-sacrifice or repayment to the gods are performed in pilgrimages to sanctuaries such as those of Chalma, Talpa, Tepeyac and others, as well as in determined Christian feasts.

MIGUEL LEÓN-PORTILLA (1987 AND 2005)

MESOAMERICAN RELIGIONS: FORMATIVE CULTURES

Religious practices during Mesoamerica's Preclassic, or Formative, period (1500 BCE–250 CE) can only be inferred from the archaeological remains. One of the most thoroughly investigated regions is the lacustrine Basin of Mexico in the central highlands, where remains of pottery and figurines provide a yardstick for determining the cultural sequence within the Basin and adjacent regions. Throughout the Preclassic this region witnessed a steady population increase and a locally diverse progression from small farming communities with developing social stratification to large towns with complex political hierarchies. The period is divided in four major phases. Different time spans for the major phases, as well as local subphases, have been proposed by various researchers. These are consolidated in the following chronology: Early Preclassic, 1500–800 BCE; Middle Pre-classic, 800–500 BCE; Late Preclassic, 500–150 BCE; Terminal Preclassic, 150 BCE–250 CE. (Piña Chan, 1972; Sanders et al., 1979).

BASIN OF MEXICO. During the Early Preclassic, the Ixtapaluca subphase (1400–800 BCE) in the southern part of the Basin of Mexico contains pottery strongly related to the Olmec style of San Lorenzo on the Gulf Coast. The Olmec tradition is also evident in figurines of great refinement, found in large numbers in the Tlatilco cemeteries, which have since been engulfed by present-day Mexico City. Most of these figurines are female. Some indicate advanced pregnancy, suggestive of a concern with human as well as agricul-

tural fertility. Other figurines show two heads on one body or heads with three eyes and two noses, believed to perhaps represent diviner-healers. In general the Tlatilco figurines, which include both Olmec and local styles, are thought to be merely grave offerings without explicit religious function. Olmec influence in the Basin was only marginal; its impact was stronger in the states of Morelos, Puebla, and Guerrero.

In the Middle Preclassic new hamlets appeared around the system of lakes in the Basin of Mexico (which have now virtually disappeared). At Zacatenco and Ticomán, figurines abound but are cruder. As they were no longer placed in graves but appeared in refuse middens, it is assumed that they served as fetishes in household cults. There are no representations of gods or goddesses that can be recognized as such with reference to the iconographic system prevalent in the Classic and Postclassic periods (250–1521 CE). Nor is there definite evidence of civic-ceremonial architecture. It has been argued that a society capable of supporting potters not engaged in full-time food production should also be able to maintain religious practitioners, such as shamans. Certain figurines depicting masked dancers in peculiar costumes have been identified as magicians (shamans) and ballplayers but they are part of the Olmec component, as are the pottery masks (Coe, 1965). Concrete evidence of shamanism, amply demonstrated for North and South America, is lacking for Preclassic Mesoamerica.

In the Late Preclassic, pyramidal mounds of modest proportions occur at some sites in the southern part of the Basin of Mexico and indicate the beginning of ceremonial activities outside the immediate household clusters. This period is notable for a veritable population explosion. Cuicuilco became the dominant political center, with five to ten thousand inhabitants, while Ticomán remained only a minor village. At Cuicuilco several small pyramids were located in the residential zone and may have served the local populace. By 400 BCE a large, oval, truncated pyramid of adobe bricks with rough stone facing was built in tiers or stages, each of which contains an altarlike structure. Access was by a ramp facing east, toward the sunrise. The town and the lower parts of the pyramid were covered by a lava flow that, according to latest estimates, occurred around 400 CE, when Cuicuilco had long ceased to be a dominant center (Heizer and Bennyhoff, 1972). However, earlier eruptions from the nearby Xitle volcano, with spectacular displays of fire, smoke, and molten lava, led to the creation of the first deity in Mesoamerica, the "old fire god." He is portrayed in clay and later exclusively in stone sculpture as an old, toothless male with a wrinkled face who bears on his head a large basin for the burning of incense. Known by his Nahuatl (Aztec) name Huehuetēotl ("old god"), he became one of the major deities of the Teotihuacán pantheon and, after the Toltec interlude, reappeared in the Aztec pantheon in different guise as Xiuh-tecutli ("turquoise lord" or "lord of the year"). The burning of incense as an offering for petitioning the gods became general practice throughout Mesoamerica, both in household

and in elaborate temple rituals. This is indicated by the great variety and number of ceramic incense burners that have been excavated.

Between 150 and 1 BCE, Teotihuacán occupied an area of about six square kilometers and was a highly stratified agrarian community. It developed into an urban center of twenty-five to thirty thousand people in the Tzacualli phase (1–150 CE), when the grid system of the town was laid out with a main north-south axis, known as the Street of the Dead (so named by the Spanish, who thought the place a necropolis). On either side of the axis were erected numerous complexes, each with three temple-pyramid and a central courtyard. The monumental Pyramid of the Sun (sixty-three meters high) and the substructure of the Pyramid of the Moon were completed in this phase during a single fifty-year construction episode. (Again, these names were given by the Spanish.) The ceremonial precinct, over four kilometers in length, served civic and religious functions and became a pilgrimage center. Dependence on seasonal rainfall for agriculture gave rise to a cult of a god of rain and lightning, Tlaloc, who became the supreme deity and continued to be one of the major gods in later cultures up to the Spanish conquest (1521). The establishment of a hierarchical priesthood can be inferred from the art and architecture of this period. In the Classic period (250–750 CE) the pantheon expanded, and Teotihuacán became the largest city of the New World.

WESTERN MEXICO. In Guanajuato, to the northwest of the Basin of Mexico, elaborate pottery and finely modeled figurines of the Chupicuaro tradition (500–1 BCE) were lavishly used for tomb offerings, and ceramic flutes, whistles, and rattles were interred in children's graves. Ceremonies included the practice of decapitation, related to warfare. This custom, however, did not become widespread until the Middle and Late Classic.

The Preclassic cultures of western Mexico (in the present-day states of Michoacán, Colima, Jalisco, and Nayarit) remained outside the Mesoamerican cotradition until about 350 CE when the Teotihuacán and Gulf Coast cultures began to penetrate the area and introduced their culture and ideology.

Most noteworthy among these loosely united chiefdoms was their concern for the dead, as evidenced by the Shaft Tomb Complex (c. 200 BCE–400/500 CE). Unparalleled in other parts of Mesoamerica, it extends in a great arc from south-central Nayarit through central Jalisco to Colima. The tombs consist of vertical entrance shafts 1.5 to 8 meters deep, with narrow, short tunnels at the end leading to one or more vaults carved in the hard volcanic soil (*tepetate*). After interment the shafts were completely filled with rubble and hand-packed dirt; stone slabs prevented the fill from entering the burial chambers. Grave offerings comprise large, hollow ceramic figures in varied local styles, representing men (some of them tomb guards with armor and weapons) and women in different poses and attitudes. The human figures have stylized features and disproportioned bodies but they are very

expressive, approaching portraitlike countenances. They reflect the customs, dress, and ornaments of the ancient inhabitants (von Winning, 1974).

Funeral processions and mourning scenes modeled in clay depict rites preceding interment. They show the mourners in orderly arrangement following a catafalque being carried to a house, or groups of mourners surrounding a corpse. Other kinds of grave offerings include complex scenes of villagers and their huts, family gatherings, ball-court scenes, bloodletting and cheek-perforation rituals, and dancers with musicians, all consisting of small, crudely modeled figurines attached to clay slabs. The variety of ceramic house models of one or two stories, some of them multichambered, is interesting inasmuch as no masonry architecture existed in this area. They replicate constructions of wattle daubed with mud, covered with a thatched roof. These were tomb offerings intended as shelters in the afterlife.

Among the smaller, solid figurines are those showing a female strapped to a slab. They appear to represent corpses on biers laid out for funeral rites, ready to be lowered through the shaft into the burial chamber. Similar ceramic “bed figures” occur in coeval contexts in Ecuador, and sporadically in the Old World (von Winning and Hammer, 1972).

A variety of large, hollow animal effigies occur also in the shaft tombs. In Colima dog effigies abound, their well-fed appearance indicates that they had been deliberately fattened to provide food for the departed. (In Aztec times fattened dogs were sold in the market for human consumption.) Skeletons of carefully buried dogs have been found in graves at Tlatilco and Chupicuaro, and it is generally believed that the dogs were supposed to help the souls of the deceased on their paths through the perils of the underworld.

The generally held view that the ceramic sculptures of the Shaft Tomb Complex portray secular subjects indicative of everyday village life has been rejected by Peter T. Furst (1975). Based on ethnographic comparisons—mainly with the beliefs and shamanistic practices among the modern Huichol Indians whose remote ancestors occupied part of the Shaft Tomb zone—he concludes that the art of western Mexico was no less religious than that of the rest of Mesoamerica. However, none of the figures display attributes that clearly identify them as deities or deity impersonators in the manner of other Mesoamerican religion and iconography. Tlaloc and Huehuetotl effigies occur only after the end of the Shaft Tomb period. Lacking temple pyramids and relevant documentary sources, the ceramic sculptures provide the only evidence for a ceremonialism that emphasized a cult of the dead.

GUERRERO AND THE PUEBLA-TLAXCALA AREA. Preclassic ceremonialism was introduced into this area by Olmec intruders. For the period after the decline of Olmec influence (after 800 BCE), information on social, political, and religious aspects is lacking. The Mezcala region of Guerrero produced

a remarkable number of highly stylized anthropomorphic figures and masks, ranging from the Preclassic Olmecoid to Teotihuacanoid types, but the stylistic sequence is not datable. Among the small stone sculptures are flat models of temple facades with doorways in which a human figure occasionally stands on top of the stairway. However, masonry temples of this type have not been reported from the Mezcala region, and the date of these artifacts is unknown. These temple sculptures probably were made in the Classic period. In the Tehuacán Valley, developments from early village life to urban communities paralleled those in other parts of Mesoamerica. The archaeological remains give no indication of religious activities.

In sum, the Preclassic figurines that appear all over Mexico north of the eighteenth parallel are similar insofar as their features were incised and clay fillets added. Neither these nor the Shaft Tomb figures represent well-defined deities with determinative attributes such as occur in later periods. With the exception of the Olmec intrusive layer and the emergence of the old fire god at Cuicuilco, and the rain god Tlaloc in Teotihuacán, in all other regions the gods, as Ignacio Bernal once said, had not yet been born.

HASSO VON WINNING (1987)

MESOAMERICAN RELIGIONS: CLASSIC CULTURES

The Classic period in the Valley of Mexico and its environs (150 BCE–750 CE) was one of florescence and of great achievement and intellectual advancement in the fields of art, government, and ideology. These centuries saw urbanism defined. Intense trade developed along established routes, diffusing ideas and material goods from one corner of Mesoamerica to another and consolidating religious thought and ceremonial.

Data for Classic period religion is based on archaeology; while no written documents from that period have come down to us, we can rightly regard mural painting, architecture, and other works of art as valid documents. Sixteenth-century chronicles describing Aztec religious belief and custom—about eight centuries after the decline of Teotihuacan—nevertheless can help us interpret earlier cultures, if used with caution. Ethnographic evidence can also shed light on ancient cultures, since in many cases there seems to be a continuity of tradition. It is significant, too, that Mesoamerica constituted a unified culture area, unlike the Mediterranean civilization that had interaction with totally different cultures from very early times on. In addition to the shared urbanism of its cultures, pre-Columbian Mesoamerica was in many ways unified by a common ideological system, with regional and temporal variation. This apparent underlying tradition of many basic beliefs allows us to compare one culture with another, but only to a certain extent and allowing for changes over time.

During the Classic period the characteristics of Mesoamerican religion were formalized. Patterns in belief, ritual, and iconography, some of them derived from earlier cultures, were set, and they formed the basis of later societies, especially those of the Toltec and the Aztec. The belief that natural forces were animate, the measurement of time as coordinated with sacred space, and the observation of heavenly bodies were some of the main characteristics. There was an intense ceremonialism supported by iconography and by oral mythic tradition. The gods were numerous, often human in form and often conceived as animals that were the gods' doubles. Religion was integrated with social organization, politics, economy, art, music, and poetry. There was a patron deity for virtually every activity, and all objects received homage and offerings, from certain flowers reserved for sovereigns

to humble implements for planting and harvesting. The world was considered a sacred structure, an image of the cosmos.

Sites and structures (and probably human activities such as processions and ritual dancing) were oriented to the sun, moon, stars, and to sacred geographical places. Architectural splendor was manifested in pyramid platforms surmounted by temples; many were painted in symbolic colors, their exteriors and interiors covered with murals. The temple in each city was the *axis mundi*, the center of the universe. Sculpture depicted religious themes, and much pottery was decorated with images of the gods. The worldview of Classic Mesoamerica was peopled with deities who intervened in every phase of life. Men who governed were deeply enmeshed in ritual. Every ruler had his priestly duties, and the priests themselves controlled the ritual calendar and thus the agricultural cycle, which was a basic part of the economy.

TEOTIHUACAN. During the Classic period, Teotihuacan, which means “place where the gods are made,” became the center of the Mesoamerican world. A vast settlement occupying more than eight square miles in the valley of the same name, a subvalley of the Basin of Mexico, the city of Teotihuacan was the leading Classic center and the most highly urbanized center in the New World. Although Teotihuacan at its height ruled the trade routes and set religious patterns for many other cultures, in its early period it barely set the stage for its later grandeur.

Founding and early history. Around the beginning of the common era, a small settlement was established in the northern part of what we now call the Teotihuacan Valley. After the eruption of the Xitle volcano in the southern part of the Basin of Mexico (c. 1000 BCE), some residents of Cuicuilco, which had been covered by lava in the eruption, probably moved to the east, into the Teotihuacan area. The refugees would have brought their own deities, especially the fire god. We see him in the Teotihuacan braziers of Huehuetotl (“old god”), who may have originated in Cuicuilco. At an early period Teotihuacan also was strongly influenced by the Puebla-Tlaxcala peoples. During the Patlachique (150–1 BCE) and the Tzacualli (1–150 CE) phases, Teotihuacan experienced explosive growth. People from the eastern and southern parts of the Basin of Mexico concentrated around this center, raising the population of Teotihuacan to eighty thousand or more (Sanders et al., 1979, pp. 184ff.; Millon, 1981, p. 221). This population concentration was reflected in the city’s direct control of agricultural production and of the obsidian industry, as well as in its importance as a regional economic center, which at the same time stimulated religious manifestation.

Toward the end of the Tzacualli phase the great Pyramid of the Sun was erected, standing more than 63 meters high and measuring 225 meters on each of its four sides. Shortly after this the Pyramid of the Moon was built with the Avenue of the Dead leading up to it. (These structures were named by the Aztec; we do not know what the Teoti-

huacanos called them.) The orientation of the Avenue of the Dead is 15°25° east of north and the major structures were aligned with this axis, slightly “skewed” from the cardinal directions. From the Tzacualli phase on, an exuberance of construction filled Teotihuacan with splendid structures, all carefully planned on a grid pattern.

Caves and cults. The most sacred place in the Teotihuacan complex was the spot where the Sun pyramid stood, underneath which lies a sacred cave. Caves were considered sacred throughout Mesoamerica, and this one designated the site for the construction of the great pyramid. Teotihuacan was a powerful religious magnet and attracted pilgrims from all over. The influx of large groups of pilgrims undoubtedly created the need for more spectacular structures and probably provided the economic means and hands for the work. According to Mircea Eliade in *The Sacred and the Profane* (New York, 1959), sacred time is relived in a sacred space by means of a pilgrimage, and divine space is repeated by building one holy place over another. In Teotihuacan this repetition took place when the great pyramid was erected over a primitive shrine, itself built over a subterranean cave. A cult of long standing existed in this cavern and was one reason that Teotihuacan became a religious center. The presence of drainage channels through which water was brought into the cave (Millon, 1981, p. 234) indicates the performance there of rituals associated with water, and the remains of ritual fires suggest a symbolic juxtaposition of fire and water, which juxtaposition was basic in Mesoamerican religion. It is likely, René Millon suggests, that the guardians of beliefs and cults in the sacred cave had awesome prestige and that this prestige and the importance of religion and ritual in general played a major part in the shaping of Teotihuacan’s hierarchical society and in the legitimation of the authority of the state.

Orientation, symbolic planning, and architecture. Urban planning, architecture, myth, and ritual were interrelated in ancient Mexico. The blending of religious-cosmological conceptions with an acute awareness of nature constituted much of the Classic worldview. The orientation of Teotihuacan’s major axis, the Avenue of the Dead, was astronomically and calendrically determined. The star group Pleiades was also influential since some structures were oriented to its rising position. The main facades of most of the pyramids, except the Pyramid of the Moon, faced west (that is, in the direction of the setting sun), as did monuments in later Mesoamerican cultures. An astronomical symbol found in strategic positions all over the city was also one of the determinants of the orientation of streets and structures. This symbol is the “pecked cross,” actually a quartered circle consisting of dots whose number probably referred to a calendrical-ritual count. It was carved on the floors of ceremonial buildings and also on rocks on the periphery of the city, which were aligned with the monuments (Aveni, 1980, p. 223).

There are more than seventy-five temples in the city. Some, found on the Avenue of the Dead, are grouped into

complexes of three, perhaps a symbolic number. More than two thousand residential compounds are located in Teotihuacan, and every residential compound had one or more local temples within it. Even within smaller units a miniature temple is often found in the center of a courtyard. That the natural environment and nearby topographical features were part of the worldview of Teotihuacan and that they figured in the planning of the city is evident from the relation of Teotihuacan to the mountains, caves, and bodies of water in its environs. On the mountaintops, rites to the rain gods were held, for here the clouds gathered and formed the precious liquid. Chronicles referring to the Aztec, whose practices can perhaps give us an insight into the earlier period, tell us that mountains were seen as female; water was thought to be held inside them as if in the womb. The mountain north of the Avenue of the Dead, whose form was mirrored by the Pyramid of the Moon, was called Tenan, “the mother” (i.e., of people) by the Aztec. Hills and waterholes were considered sacred, as were trees, for they protected people and provided sustenance in the form of leaves, fruit, and roots.

Teotihuacan, like most of Mesoamerica, was basically an agricultural society. Observance of the seasons was controlled by a ritual calendar and the invocation of rain through propitiation of the gods was an important ceremony. Lake Tezcoco, the great body of water that covered a large part of the Basin of Mexico, came almost to the borders of Teotihuacan and provided aquatic foods and a waterway for transportation. So for the Teotihuacanos, the gods of water were associated with “Our Mother” (as the lake was called in Aztec times) as well as with rain and mountaintops. This setting of natural abundance was enhanced in Teotihuacan by local deposits of obsidian, which was considered divine.

The Avenue of the Dead extends almost two thousand meters from the Sun and Moon pyramids to the Ciudadela (Span., “citadel”), Teotihuacan’s religious and political center during much of the metropolis’s existence. The vast quadrangle (4.4 hectares) is surrounded on each of its four sides by wide platforms topped by four low pyramids on three sides, and by three at the east or rear (Millon, 1981, p. 203). Entrance to the complex is only from the Avenue of the Dead on the west and from the north, suggesting that entrance to and exit from the area were strictly controlled. Living quarters in the northeast and southeast of the Ciudadela could have housed about 250 persons, probably high cult officials. George L. Cowgill states that while the head of state must have resided in the Ciudadela, his presence here was largely ceremonial and the real governing activity was carried out elsewhere (Cowgill, 1983). A square platform with a staircase on each of its four sides in the middle of the quadrangle suggests large-scale rites; theatrical performances of a religious character evidently were held here.

At the eastern end of the Ciudadela stands the majestic pyramid known as the Temple of Quetzalcoatl, so called be-

cause of the feathered serpents that decorate its facade—although the temple was not necessarily dedicated to Quetzalcoatl, who in the Postclassic period was a god of civilization, creation, and the arts. Also on the facade are heads of fire serpents that have been identified erroneously as representations of the rain god Tlaloc. The spectacular Temple of Quetzalcoatl was erected in the second construction period of the Ciudadela (probably 150–200 CE), coeval in part with the Sun and Moon pyramids, and was used (and at times rebuilt) up until the end of Teotihuacan, around 750 CE. But at one period in the city’s history (c. 300 CE), another smaller pyramid, the Adosada (Span., “affixed”) was attached to its facade, partly blocking the earlier building. The Adosada seems to have enhanced rather than eclipsed the Temple of Quetzalcoatl’s religious importance. Perhaps this was an architectural rather than an ideological renovation. According to Cowgill (1983), the religious and political significance combined in the Ciudadela and the Quetzalcoatl pyramid cult was intimately associated with Teotihuacan’s rulership. He also suggests that increased activity associated with the Quetzalcoatl temple may have necessitated the building of this extra structure.

A pyramid platform in the southern part of the Ciudadela is decorated with red X designs and with green circles, symbols of water, “that which is precious.” The X is clearly an *ollin*, symbol of motion (or of the movement of the sun, according to later Aztec tradition). The joining of water and fire (in this case, the sun) are thus represented during this early period. Although the combination symbolized war in the Postclassic period, here in Teotihuacan it may have had astronomical significance.

Another enormous area of dwellings, pyramids, platforms, temples, and courtyards occupying many hectares along the major avenue, and known as the Avenue of the Dead Complex, has been tentatively identified as the center of governmental functions. The *talud* (“sloping panel”) combined with the *tablero* (“vertical panel”) is the characteristic Teotihuacan facade for religious structures and has long been recognized as the sign that a building faced in such a way is a temple (Millon, 1981, p. 229). This convention was also applied to public buildings and residential compounds, thus consecrating the entire avenue, as well as giving a sacred character to buildings in other zones that incorporate the *talud-tablero* mode of facing. Juan Vidarte de Linares (cited in Cowgill, 1983) has interpreted the Avenue of the Dead, lined with temple platforms thus built, as a great open-air cathedral.

Art. The art of Teotihuacan is intensely religious. Mural painting (one of the major art forms) on buildings, temples, and shrines, leads Clara Millon (cited in Millon, 1981, p. 213) to consider it the “official graphic medium for transmitting ideas and beliefs . . . ideologically acceptable and desirable.” Murals were an ideal medium for communication because they were out in the open for all to see. In the interior of palaces, where the paintings usually had a religious con-

text, their messages, perhaps understood only by priests, must also have constituted a type of didactic “book” on the walls. Sculpture in Teotihuacan was usually architectural: roof merlons with year-sign motifs, serpentine balustrades on stairways (later seen at Tenayuca, Chichén Itzá, and other sites), zoomorphic stone heads on the facades of buildings (on, for example, the Temple of Quetzalcoatl and at one time on the Pyramid of the Sun), and stone figures perhaps representing gods, such as the old fire god. A relief panel recently discovered in the West Plaza of the Avenue of the Dead Complex represents a personage with rain god characteristics holding a rattle in either hand. According to Noel Morelos, the archaeologist who discovered it, the image is somewhat similar to Tlaloc figures in the Tetitla and Tepantitla murals at Teotihuacan. Another rich source of information is pottery, painted or decorated with other techniques, that depicts rituals and either deities or priests.

The large braziers found at Teotihuacan are sometimes called “theaters” because the masks surrounded by symbolic elements that are attached to them are reminiscent of the stage. *Candeleros* (Span., “candle-sticks”) must have been used for copal incense; the Teotihuacanos had no candles. The use of clay figurines can only be guessed at. Some may have been used on household altars or kept by pilgrims as souvenirs from sacred places. “Portrait figurines,” sometimes called “dancers,” are small, nude, sexless people in animated positions. Other clay figures are “puppets,” with movable arms and legs, nude bodies, and carefully made and adorned heads. Lack of body adornment on the portrait figurines and puppets suggests that they were dressed in bark paper, a ritual material, for ceremonial use. Clay dogs may, as among the Aztec, have represented the animal that accompanied the deceased to the afterworld.

A possible warrior cult, involving relations with other regions of Mesoamerica, is indicated by representations of military figures in the murals, on decorated pottery, and in figurines. Some of the figurines wear warrior vestments, including animal helmets. Painted representations of people holding excised hearts on knives, as in a mural in the Atetelco (another architectural complex, or palace), may indicate the existence of a warrior cult, although they might represent human sacrifice practiced for ritual reasons. Citing the work of Hasso von Winning and George Kubler, Esther Pasztory (1978, p. 133) notes that war-related iconographic themes in Teotihuacan include the sun god as a raptorial bird and as a feline, warriors in animal disguise, and an owl-and-weapon symbol.

Burials. Funerary customs also shed light on the religion of Teotihuacan. Cremation was practiced and was possibly related to the later Aztec belief that a person’s possessions must be burned in order to travel to the afterworld, where they would be turned over to the lord of the dead. Interment was also practiced; burials were accompanied by grave goods—vessels whose contents may have been food or other necessities for the other world and miniature objects

that were symbolic offerings. Mica decorated some of the large braziers and urns and has been found under floors. Its meaning is obscure, but it is mirrorlike and mirrors were used for divining.

Deities. Names of Teotihuacan gods are unknown to us; therefore we refer to them by their characteristics or symbols, sometimes comparing them to Aztec deities whose iconography and function are similar. Esther Pasztory (1973, p. 147) has noted that the structure of Teotihuacan iconography is in many ways similar to that of the Aztec, for which we have written data, and image clusters have been identified in Teotihuacan that have elements similar to representations of Aztec deities. The presence of water-agricultural deities is indicated by aquatic symbols such as streams, water dripping from shells, fish, frogs, and water lilies. The god associated with rain and the earth is distinguished by traits found on the Aztec deity Tlaloc—goggle eyes and fangs, for example—but also by a water lily in his mouth, a lightning staff, a vessel with water, a year-sign headdress, and crocodilian traits. Pasztory calls him “Tlaloc A.” “Tlaloc B” appeared later on the scene when there was a trend toward militarism in Teotihuacan. Some of Tlaloc B’s diagnostic traits are a bifurcated tongue, a *bigotera* (Span., “mustache”), and jaguar features. Both “Tlalocs” are associated with water, although the latter, because his image is found in foreign centers and is related to persons who may be representatives of the Teotihuacan state, seems to be connected with military and foreign relations as well. Pasztory (1978, p. 134) sees Tlaloc B, or the “Jaguar Tlaloc,” as possibly being the patron deity of Teotihuacan, and claims that the “patron deity cult,” later practiced among the Toltec and Aztec (which was different from a cult to deified ancestors) originated in Teotihuacan. She also notes that Teotihuacan was the first culture in Mesoamerica to develop a state cult from the earlier agricultural fertility cult. To this must be added the importance of aquatic sustenance from the nearby lake, to which many of the water symbols may refer.

Evidence of other deities is scanty, but among those believed to have existed in Teotihuacan are Huehuetotl, whose brazier, which was designed to be carried on the head, suggests he is a fire god, and an earth mother figure who may have been associated with water and vegetation. She is represented in the Tepantitla murals surrounded by fertility symbols such as plants, drops of water, seeds, and birds. Formerly she was thought to be a male water god, and in Aztec times she had a number of names, including Xochiquetzal (“precious flower”). A precursor of this goddess may be represented in some figurines whose headdresses bear flowers, usually the characteristic mark of Xochiquetzal. A majestic stone statue discovered near the Pyramid of the Moon may have water association, due to the “meanders” (water symbols) on her garments. The agricultural fertility cult was associated with gods of earth, water, rain, crops, sun, and moon. A large stone disk, with rays surrounding a skull head, seems to represent the sun. It was painted red, the color applied to

bodies of the deceased; thus it may represent the setting sun that dies in the west. Deformed figures represented on the walls of the Atetelco suggest Nanahuatzin, the sick god of the Aztec tradition who became the sun, although these may not actually portray him. Another god portrayed is the feathered serpent, but there is no way of knowing if he is the same god the Aztec worshiped under the name Quetzalcoatl. There is also a “flayed god,” represented in clay figurines and on pottery vessels. One statue depicts a flayed god (or his surrogate) wearing a human skin. This deity may be related to the later Xipe Totec, Aztec god of vegetation, although this large clay figure dates from the beginning of the Postclassic era.

There may also have been a “dual complex,” a male-female creative force, such as existed later in Aztec cosmology. This could be inferred from the two major pyramids. Innumerable figurines with hollow interiors that in turn contain one or more miniature figures fully dressed may represent a creator deity. But the most convincing evidence indicates that the pantheon was built around forces of water and fertility.

Creation of the sun in Teotihuacan. Animals portrayed in a mural painting called the Mural of the Mythological Animals may be an early version of the myth of the four Suns, or eras, that form part of Aztec mythology (Millon, 1972, p. 7). Jaguars devouring fish, a type of *cipactli* (crocodilian) earth creature, and evidence of a cataclysm are seen in the Teotihuacan mural. The creation of the Fifth Sun in Teotihuacan (the Aztec mythical celestial plain), in which the poor deformed god Nanahuatzin threw himself into the fire to become the sun, constitutes one of the great Mesoamerican myths. This myth may have been invented *a posteriori* by the Aztec in order to explain the creation of their own era, the Fifth Sun, associated with the “place where the gods are made” (i.e., Teotihuacan) and with their sacred ancestors, the Teotihuacanos. The impact of Teotihuacan religion and myth on the Aztec is evident from the orientation of the sacred precinct in Tenochtitlan, the Aztec capital. This was based on the fact that, in the myth of the Fifth Sun, the gods in Teotihuacan, after the birth of the sun, faced the four directions to see where it would rise. Four gateways facing these directions were made in Tenochtitlan in memory of the myth. The desire of the Aztec to view Teotihuacan as the sacred ancestral place can be seen here and also in the fact that the Aztec sovereign worshiped there every twenty days.

Ritual. Ritual, as represented in many paintings, was clearly an important aspect of Teotihuacan religion. One example of such a representation is that of the priests, depicted in profile, who face the great central figure in the Tepantitla mural, and who evidently are carrying out a ceremony involving this earth-god figure. Men (as gods’ surrogates) in ritual attitudes are also depicted on decorated pottery. The very layout of the major avenues and structures of the city brings to mind the probability of dramatic processions led by religious leaders, involving a large part of the population

and possibly pilgrims. Processions would probably have stopped at the small altar-platforms in the center of the avenues, where rites would have been performed. Fray Diego Durán (1971, p. 296) writes about didactic yet amusing skits involving deities that were performed during the later Aztec religious festivals, which may provide us with parallels of earlier ritual celebrations. Colonial chronicles describe Aztec processions in which the costumes of the participants, the materials of which they were made, and their colors were all significant: yellow face paint symbolized maize; “popcorn” garlands represented the dry season. People walked, danced, and sang in the processions; the beat of the drum, the shrill sound of a native flute, and the rhythmic tone of chanted poetry set the pace for their steps. Large braziers may have been carried at the head of the procession, smoke from resin incense floating upward as a medium for communication with the gods. A ritual liquid such as *pulque* may have been poured on the ground. Hands pouring precious symbols in streams are depicted in Teotihuacan murals, representing this type of libation. Processions like these would have been public rituals to celebrate seasonal, calendrical, religious, political, and agricultural events. The changing of the seasons and their effect upon the crops, for example, called for constant celebration and/or propitiation of the gods.

Parallel with the public rituals would have been rites performed at small temples in residential compounds. Household worship probably occurred at times when major events took place but also in relation to the more private cycles of the household. People close to the soil practice innumerable ceremonies important to their well-being. In postclassic times rites were performed annually (as they still are today) to honor agricultural implements; permission is still ritually requested of the earth to break the surface in order to plant; clay figurines are buried in the fields as offerings; terracotta frogs or water-deity figures are thrown into waterholes; food and clay images are placed in caves for the “owners of maize” and plants. Evidence of some concern in Teotihuacan culture for human fertility is provided by figurines of pregnant women, which were most likely used in rites of fecundity.

The end of Teotihuacan and its heritage. The eclipse of Teotihuacan took place around 750 CE, when much of the city was burned, the destruction centering on religious and public buildings. Statues of the gods were broken and their faces mutilated (Jarquin and Martínez, 1982, p. 36). (In the pictorial manuscripts from Postclassic Mexico the conquest of a city is generally depicted by the burning of its temples.) Burning occurred mainly in the heart of Teotihuacan—four hundred instances of burning are evident in the Avenue of the Dead zone alone (Millon, 1981, pp. 236–237)—but to date there is no evidence of foreign invaders, such as non-Teotihuacan weapons or the like. The burning of temples and smashing of images implies ritual destruction, and René Millon points out that many religious structures in Mesoamerica were ritually burned and then reconstructed. The

destruction of Teotihuacan's temples was so complete, however, that in spite of later building at the site, the city never again rose to even a portion of its former grandeur.

Meanwhile, other peoples had filtered into the valley, including the Toltec and the Chichimec. As Teotihuacan fell other centers rose. Sites in Tlaxcala expanded. Cacaxtla adopted many Teotihuacan motifs and possibly its cultural ideas as well. Xochicalco, a critical point on a trade route from the south, became powerful. El Tajín acquired more importance in the Gulf Coast region. Teotihuacan as a live metropolis disappeared, but its fame and influence lived on. South to the Maya region, east to the Gulf, west to the Pacific, and north to Alta-vista (near what would become the United States border), Teotihuacan religion, art, myth, and tradition spread and were adapted to other cultures. This great civilization and religious center took its place as the revered ancestor of many later cultures.

CHOLULA. About two hundred kilometers to the southeast, Cholula was a sister city to Teotihuacan during the Classic period; Quetzalcoatl was its principal god. According to archaeologist Eduardo Merlo, the earliest pyramid at Cholula (c. 150 BCE), was constructed over a sacred spring, paralleling the Teotihuacan tradition of building over a consecrated spot. The Mural of the Bebedores (Span., "drinkers"; c. 200 CE) in Cholula, at the west side of the great pyramid, portrays elaborate scenes of ritual drinking of *pulque*. This mural is dedicated to agricultural fertility and to *pulque* gods. The main Classic period deity here was the water goddess, and it is interesting that the patron saint of present-day Cholula, whose sanctuary is built on top of the great pyramid, is the Virgin of Los Remedios, whose special province is the control of the water supply (Olivera, 1970, pp. 212–213).

Cantona, in the Puebla-Tlaxcala Valley, was contemporary with early Cholula and Teotihuacan but was evidently eclipsed by the dramatic rise of the latter. Cantona must have been an important religious pilgrimage center and was possibly a Gulf Coast link with the central highlands. More than sixteen square kilometers in area, this site dates from the Late Preclassic into the Middle Classic and exhibits strong Veracruz influence, as seen in the ball-game cult, represented by sixteen courts. There are thousands of unexplored mounds, many dwellings, one excavated igloo-type sweat bath, and the unexplored remains of about twenty more of these structures. According to archaeologist Diana Lopez, these were used for ritual bathing.

MONTE ALBÁN AND OAXACA. The Valley of Oaxaca is an archaeologically rich area in the central part of the present state of Oaxaca in south-central Mexico. Ecological advantages, effectively exploited, contributed to the rise of urbanism here centuries earlier than in other nearby regions north and west of the valley (Paddock, 1966, p. 242). In this setting the splendid Zapotec civilization of Monte Albán arose. This city was built on five artificially leveled hills just east of today's city of Oaxaca and covered a total area of six and a half square kilometers. Monte Albán's main plaza, 150 by 300 meters,

dominates the central hill, producing a whole that can be seen as the center and four corners of the universe. This central hill contains both religious and residential buildings: pyramid platforms, a main plaza and smaller ones, a ball court, the royal residence, and subterranean tombs whose entrances are protected by gods and whose interiors were filled with funerary urns in the form of gods. Richard Blanton (in Flannery and Marcus, 1983, p. 84) suggests that Monte Albán, constructed on a hilltop not easily accessible, yet near a rich alluvial plain, was the principal center of the region. Its hilltop location probably was in part a defensive measure against possible incursions, although many other important centers in Oaxaca also were built on mountaintops: for example, Monte Negro, Quiotepec, and Guiengola. There could also have been a religious motivation in this, in that the summits of mountains were often held to be sacred in ancient Mesoamerica and are dedicated to gods of rain.

Although Monte Albán has traditionally been seen as indebted to Teotihuacan for much of its religion, art, and ideas, Kent V. Flannery, Joyce Marcus, and John Paddock (Flannery and Marcus, 1983, p. 161) point out that the Zapotec autonomous tradition was thousands of years old when Monte Albán was built (c. 100 BCE) and that hieroglyphic writing was developed there before Teotihuacan was founded. Strong influence and exchange between the two centers did exist, however. There was an enclave of Oaxaca people in Teotihuacan, whose residents lived in their own zone, produced Oaxaca-style pottery, constructed a stone-lined Oaxaca tomb and stela, or tomb jamb, and who worshiped their own gods, if one may judge from two funerary urns representing a god with serpent buccal mask found in the tomb (Millon, 1973, I, pp. 141–142). Although no comparable Teotihuacano enclave has been found at Monte Albán, Teotihuacan personages are represented on some of the city's monuments. They carry copal incense bags (characteristic of priests) and wear identifying deity, animal, or "tassel" Teotihuacan headdresses. A Teotihuacan-style temple is also depicted. Marcus (Flannery and Marcus, 1983, p. 179) interprets these scenes as visual proof that Teotihuacan and Monte Albán had emissaries who consolidated agreements through rituals, thus placing these treaties in a sacred context.

Early history. Monte Albán has a long history, beginning about 500 BCE. Between 200 BCE and 100 CE (Monte Albán I–II) this center of ten thousand inhabitants constructed large defensive walls and masonry tombs. Three hundred carved stone monuments with calendrical and military themes have been found dating from this period, along with hieroglyphic writing and effigy vessels possibly representing gods (Marcus, in Flannery and Marcus, 1983, pp. 52–53, 95). The nude figures in distorted poses known as *danzantes* (Span., "dancers") were carved on stone slabs along with symbols of sacrifice. They represented captives and as such may refer to ritual death. They also may represent a symbolic display of power. Fear-inspiring propaganda

of this type was repeated—in ritual, not sculpture—many centuries later by the Aztec, who invited their enemies to witness mass sacrifices of war captives. Toward the end of this early period there were highly developed traits such as a complex pantheon of deities, ceremonial architecture, a stratified society, increased population, and political, economic, and military influence outside the Valley of Oaxaca (Paddock, 1966, pp. 111–119). The plan of the Zapotec temple at this time, with an inner chamber reserved for members of the cult, points to the existence of full-time priests and an incipient state religion (Flannery, in Flannery and Marcus, 1983, p. 82).

Florescence of Monte Albán. Classic Monte Albán (Monte Albán III) covers the period from 100 to 600 CE. This was a period of florescence during which the population reached its maximum size and both the main plaza and neighboring hills became covered with monumental structures. Restricted entrance to the main plaza suggests that its use may have been mainly for religious and civil leaders, yet its size would indicate that on some occasions rites were celebrated involving the general populace, which Blanton (in Flannery and Marcus, 1983, pp. 131–133) estimates at approximately thirty thousand. The temples had full-time priests plus a high priest (Flannery, in Flannery and Marcus, 1983, pp. 132, 134). As in other Mesoamerican societies, the Zapotec ruler was given a year of religious training, and the priesthood was drawn from noble families. The ruler worshiped at a special shrine.

Tombs, funerary urns, and Zapotec gods. Typical of Monte Albán is the subterranean cruciform tomb, probably constructed during its future occupant's life and over which a temple or residential structure was built. Living quarters over these tombs indicate that the descendants of the deceased (probably usually rulers) practiced ancestor worship (Flannery and Marcus, 1983, pp. 135, 345). Personages represented in the murals of Tomb 104 and Tomb 105, described by Alfonso Caso as gods, evidently depict royal couples dressed in the garb of deities. As in Asia, the dead ruler or forefather had to be propitiated in order to protect the living. The people portrayed in these tombs, then, are the royal, deified ancestors of those buried here. The four rooms of the building over Tomb 105 are oriented to the four cardinal directions, indicating a cosmic plan in the building of Monte Albán. In a niche above the entrance to each tomb is a funerary urn. Within the tomb more urns appear. Urns have been found, too, as offerings in temples and caches. Most of the urns are anthropomorphic in form; many wear zoomorphic masks and headdresses and they are adorned with numerals and glyphs.

One type of urn, the *acompañante* (Span., “companion” or “attendant”), has been found either with the deceased or with the major urns themselves. There are two schools of thought regarding the funeral urns. Alfonso Caso and Ignacio Bernal (1952) define them as gods, while Joyce Marcus (in Flannery and Marcus, 1983, pp. 144–148) interprets

them as deceased ancestors. Sixteenth-century chronicles associate calendric names with personages but not with gods. The Spanish at that time did not understand this reference to ancestors because they were unfamiliar with the system of naming forefathers with dates; therefore they often mistook figures of dead rulers for deities, and this confusion has persisted. Because they had no knowledge of Zapotec, Europeans often mistook titles of nobility or references to natural forces (such as *cocijo*, which means “lightning”) for names of deities.

Caso and Bernal (1952), who believe them to be gods, identify the figures depicted on the funerary urns as follows: Cocijo, the rain god (who also has maize aspects, judging from the corn cobs in his headdress on some urns); Pitao Cozobi, god of maize and grains; other maize-sustenance deities such as 5 Flower Quiepelagayo and a god referred to as “with bow in the Headdress”; a Zapotec version of Quetzalcoatl; a flayed god (Xipe?), represented carrying a disembodied head; an old god associated with caves and the underworld; 13 Serpent, an earth mother; and animal deities such as the parrot (associated with the sun), the jaguar (associated with rain), and the bat and the *tlacuache* (opossum), both associated with maize.

Natural forces. Joyce Marcus (in Flannery and Marcus, 1983, pp. 345–351) stresses the importance in Zapotec religion of animism—the animate character of things such as trees, stars, hills, but especially powerful natural and supernatural forces. A vital force was *pèe* (“wind, breath, spirit”) and this existed in man, animals, the 260-day ritual calendar, light, the sun, the moon, clouds, lightning, rain, fire, and earthquakes. *Pitào*, the augmentative form of *pèe*, means “great breath” or “great spirit,” and refers to a sacred quality. Lightning, (*cocijo*) was a highly revered element among the Zapotec because it brought rain. According to Fray Juan de Córdova's *Arte del idioma zapoteca* (1578), the thirteen-day period in the pre-Hispanic calendar (13 numbers x 20 day names = 260 days constituting the ritual-divinatory calendar) was called *cocijo* or *pitào*. Thus the gods were identified with time periods and with phenomena associated with the calendar.

Clouds were held as sacred by the Zapotec. In fact, they considered themselves descended from clouds, just as the Mixtec regarded trees as their primordial ancestors. After death, the Zapotec believed, they once again became clouds. The Zapotec not only had an organized priesthood, temples, and elaborate ritual, but they also considered places such as caves, mountains, certain trees, springs, and other natural sites to be sacred shrines.

Other Oaxaca sites. Monte Albán was the major Zapotec civil and religious center, yet it was not the only sacred place in Oaxaca. Dainzú, a place distinguished by stone reliefs of masked ball players, was coeval with early Monte Albán. The ball players, some in jaguar disguise, are evidently engaged in a ritual game. A number of these carved slabs are set into the lowest level of a pyramid-temple structure. They

are similar to Monte Albán's *danzantes*. Stones of the same type have turned up in many sites in the Oaxaca Valley, among them Macuilxochitl and Tlacochoauaya. Other sites in the valley, of which there are many (Yagul, Caballito Blanco, Mitla, Loma Larga, Lambityeco) were contemporary in part with Monte Albán and shared the same religious beliefs and practices. Many of these were not occupied until after the Classic period and thus fall outside this discussion. But Oaxaca is rich in archeological zones, many dating from the Classic. In the Nūiñe culture in the lower Mixtec region (northern Oaxaca and southern Puebla), the pantheon was similar to that of Monte Albán, containing gods of earth, rain, wind, death, fire, jaguar, and perhaps vegetation represented by flayed figures (Moser, in Flannery and Marcus, 1983, p. 212). San José Mogote was largely a Preclassic settlement, but in the Classic period (corresponding to Monte Alban II), there were numerous temples there and, as at Monte Albán, a court for the ritual ball game.

EL TAJÍN AND THE GULF COAST REGION. About three hundred kilometers east of Teotihuacan lies the lush, humid Gulf of Mexico region, home of numerous archaeological sites. The most important of these is El Tajín, dating from around 100 BCE and continuing through the Classic period and into the early Postclassic. El Tajín continued to be occupied, by the Totonac, on a small scale for a few centuries after this. Although this rich region is called Totonacapan, the Totonac, for whom it was named, were a late group; the modern inhabitants are still Totonac. El Tajín was built by the Maya-related Huastec people. It may be that the baroque flavor in El Tajín art derives from a Maya heritage, but probably this reflects the natural environment with its lush vegetation. *Tajín* means "lightning," "hurricane," "thunder" and names these forces. Like the Zapotec, the Totonac believed that lightning brings rain, but near the Gulf of Mexico the rain often comes in the form of hurricanes, for this is a region of violent winds and precipitation. Thus, Tajín and the god Huracán are often seen as one, the god of tropical storms, who, like the Aztec god Tezcatlipoca, can be both beneficial and destructive.

Religion at El Tajín followed the typical Mesoamerican pattern of temple-pyramids, formal priesthood, a pantheon of gods, ritual calendar, pilgrimages to its center district, periodic festivities, sacrifice and bloodletting, and other traits already mentioned. But El Tajín and the Gulf Coast region exemplify certain distinct characteristics not found elsewhere. For example, the main pyramid at El Tajín is lavishly decorated with niches, which is typical of this site and of nearby Yohualichan ("house of night") in southern Puebla. The ball court, although common in Mesoamerica, occupies a primary importance in El Tajín, where there are ten (Wilkerson, 1980, p. 219). Their wall panels are decorated with spectacular scenes of ritual and sacrifice.

El Tajín became the major religious and administrative center of the region in the first few centuries of the current era. El Tajín's peak, in size, population, wealth, and religious

importance, was between 600 and 900 CE, toward the end of the Classic period. This great city has been partially excavated by Mexico's Instituto Nacional de Antropología e Historia. Its most spectacular building is the Pyramid of the Niches, dedicated to rain and wind gods, whose 365 niches are thought to be related to the solar calendar. Originally the pyramid's facade was painted in various colors, mainly red, the color of life and also of death. A *xicalcolihqui*, a fret in stone mosaic, decorates the balustrades on either side of the pyramid's stairway. The *xicalcolihqui*, popular in ancient Mexican sites, especially Mitla, but probably of Maya origin, may be symbolic of serpents of rain and wind. Originally, grotesque wind-rain serpents framed the panels of ritual scenes at the top of the temple.

The ball-game cult. Typical of the Gulf area is the *yugo-hacha-palma-candado* (Span., "yoke-ax-palm-padlock") complex, consisting of objects sculptured similar to these forms. The elements of this complex seem to form part of the ritual ball game. In the Maya zone, players are depicted wearing padded waist protectors formed like yokes, and figures are often seen wearing *palmas* in their belts. S. Jeffrey K. Wilkerson (1980, p. 219) states that at El Tajín the paraphernalia of the ball game became cult objects when carved in stone, and that stone copies of the wooden waist protectors, or yokes, were symbols of the jaws of the earth, into which the wearer descended after death. In El Tajín and probably all over Mesoamerica the ball game was a ritual act and concluded with one of the players, usually impersonating a god, being decapitated. Burials in the Veracruz region were frequently accompanied by elaborately carved stone yokes and other ball-game symbols. The ball-game cult started in the Preclassic, probably among the Olmec. The Gulf area was the home of rubber and the cult most likely originated here and then spread out to other regions, diffused by traders who took cacao and rubber (as well as their ideology) from the lowlands to the highlands. Both the cacao tree and ballplayers are represented in murals at Teotihuacan. In the Maya region, some Classic period ball-court markers were associated with symbols of the sun, water, and vegetation. The purpose of the sacrifice of a player at the end of the game, as seen on El Tajín reliefs, was the rejuvenation of agricultural and solar fertility, the cycle of death and rebirth in nature (Pasztory, 1978, p. 139). The stone reliefs at El Tajín portray ballplayers, rites to the rain god and to a deity of pulque, autosacrifice from genitals, decapitation of a ballplayer and his descent into the underworld, and sacrifice by extraction of the heart (Kampen, 1972).

Smiling figures and divine women. Among the ritual manifestations of the Classic period of the Gulf area are the "smiling figures" from Remojadas and El Zapotal, murals from Higuera, and lifesize terracotta sculptures of *cihuateteo* ("divine women"). El Zapotal, located in southern Veracruz near the Olmec site of Cerro de las Mesas, had its florescent period from 500 to 800 CE. Unlike the Zapotec and Mixtec, who had a cult to the dead, this Totonac culture apparently

maintained a cult to death itself. In a major temple at El Zapotal there is an altar 1.6 meters high with a seated terracotta figure of the death god. His skeletal form is surrounded by skulls. Equally dramatic are the monumental clay figures called by the Postclassic term *cihuateteo*. Colonial chronicles identify the *cihuateteo* as women who died in childbirth and who then were deified, joining dead warriors in the task of helping the sun cross the sky. They were considered warriors because they lost their lives while taking a “prisoner,” that is, the child. These striking figures wear skirts fastened by large serpent belts and carry trophy-head staffs in one hand. Each woman seems to be covered with a flayed skin, which might indicate a cult to a female vegetation deity (Gutiérrez Solana and Hamilton, 1977, p. 146). The presence of the serpent around the waist may refer, however, to a Serpent Woman who was, in Postclassic times, a goddess (the Aztec goddess Cihuacoatl) associated with war, sacrifice, and political power. Among the other deities represented in the monumental El Zapotal sculptures are male gods of rain, an old fire god—whose presence shows Teotihuacan influence—and a flayed god. Skeletal remains at this site, found in burials where offerings of terracotta sculptures were placed, reveal decapitation and dismemberment on a vast scale, probably as a result of sacrifice. Next to one rich offering of sculpture was an ossarium containing eighty-two skulls, many of them women’s. The female skulls may indicate a death-fertility cult because, in a later period, sacrifice by decapitation represented the harvesting of first fruits, especially the cutting of an ear of corn. At El Zapotal, yokes, axes, and smiling figures have also been found, although the latter are more typical of Remojadas, a site north of El Zapotal noted for its splendid clay sculpture. The smiling figures are just that: their mouths are open in broad smiles, their legs are apart in an attitude of dancing, their arms flung wide. These have been interpreted as representations of a cognate of Xochipilli, the Aztec god of song and dance, but it is possible that they portray surrogates of the gods, drugged as they go to their sacrifice. The colonial chronicler Durán described the pre-Hispanic custom of giving these god-representatives drinks containing hallucinogens so they would laugh, dance, and fling out their arms on the way to the sacrificial knife. If they were not “happy” this was considered a bad omen.

Las Higueras is a late Classic Totonac site (600–800 CE), with outstanding mural paintings. Represented here are the ever-present Huracán, shown supine at the bottom of the sea, surrounded by sharks; water or “flood” gods, pouring liquid over the land; a female moon; the sun; and a crocodilian earth god. Priests with incense bags, a temple, and ball courts are also represented (Arellanos et al., 1975, pp. 309–312).

MESOAMERICAN RELIGIONS: POSTCLASSIC CULTURES

This entry is devoted to a summary of the religious patterns of the leading peoples of that portion of the Mesoamerican area cotradition located west of the Isthmus of Tehuantepec in the Postclassic period (c. 900–1521 CE). Western Mesoamerica was a complex mosaic of linguistic-ethnic groups organized into various polities, but certain ones stand out most prominently: the Aztec, Tarascan, Otomí, Huastec, Totonac, Mixtec, and Zapotec. Although those who spoke the same language normally shared most cultural characteristics, including religious-ritual patterns, rarely were they unified politically. The more advanced groups were organized into what can be called city-states. Occasionally an especially powerful one of these, usually confederated with others, embarked on an imperialistic course, extending its military and political control over a wide area. The earliest well-documented empire of this type, one that may have dominated much of central Mexico, was that of the Toltec, so named from their capital, Tollan (or Tula), north of the Basin of Mexico. The flowering of the Toltec empire appears to have been essentially coterminous with the Early Postclassic period (c. 900–1200 CE). Coverage will begin with a concise review of what is known concerning Toltec religion.

TOLTEC RELIGION. At the time of the Conquest, many traditions were extant concerning the Toltec, the prestigious political and cultural predecessors of the Aztec. Whereas they emphasized dynastic themes primarily, they occasionally included some references to religious-ritual aspects. Together with the archaeological evidence, they provide a picture, however incomplete, of a rich religious tradition directly ancestral to that which prevailed in central Mexico at the time of the Conquest.

Many Aztec deities were anticipated in the Toltec pantheon. The most prominent was Quetzalcoatl, symbolized by a rattlesnake covered with feathers. In Aztec religious ideology this deity particularly expressed creativity and fertility, with emphasis on the vivifying and fructifying role of the wind (or breath), Ehécatl, which Quetzalcoatl bore as an additional appellation. The fusion of snake and bird in his icon can be interpreted as the creative coupling of earth and sky. The Toltec concept of Quetzalcoatl was probably similar, but the situation is complicated by the merging of the supernatural personage with a Toltec ruler, Topiltzin, apparently a particular devotee of the god, whose name he also carried as a title. A rich corpus of traditional narratives surrounded this remarkable figure, Topiltzin Quetzalcoatl, who was the archetype of the Toltec and Aztec priesthood and credited with introducing autosacrificial rituals into the cult. Topiltzin Quetzalcoatl was forced to abandon Tollan, persecuted by

the omnipotent, capricious god of gods, Tezcatlipoca. Moving down to the Gulf Coast with a band of followers, Topiltzin Quetzalcoatl died and was cremated, and his soul ascended into heaven and became the Morning Star. He was considered to have been the founder of all "legitimate" political power in central Mexico, and the rulers of Mexico Tenochtitlán, the Aztec capital, claimed direct dynastic descent from him—with the expectation that he would some day return to reclaim his royal dignity.

Other Toltec deities mentioned in the traditions include the androgynous creative deity with various names, among them Ometecuhtli/Omecihuatl; Xipe Totec, who expressed the concept of fertility in a macabre fashion as his devotees ritually donned the skins of sacrificed human victims; Tlazolteotl-Ixcuina, a major earth and fertility goddess whose cult was reputedly introduced from the Huastec; and Tlaloc, the ancient, preeminent rain and fertility deity. Archaeological evidence confirms the importance of these supernaturals in the Toltec pantheon and indicates the presence of various others: the *pulque* (*octli*) gods, as well as Mayahuel, the female personification of the maguey plant, the source of the intoxicating beverage *pulque*; the Venus deity, Tlahuizcalpantecuhtli, closely related to Quetzalcoatl; the hunting and war deity, Mixcoatl; Itz'papalotl, another earth and fertility goddess allied to Mixcoatl; and, possibly, the old fire god, Xiuhtecuhtli-Huehuetēotl. The Toltec pantheon probably included many other deities not mentioned in the traditions or evidenced by archaeological remains, and it is likely that at the time of the Conquest most were still propitiated in some form in central Mexico.

Toltec ceremonialism was probably similar to the overall system prevailing in the Late Postclassic, especially as regards the calendrically regulated ritual. It is virtually certain that the two basic Mesoamerican calendric cycles, the 260-day (13 x 20) divinatory cycle, called the *tonalpohualli* by the Aztec, and the 365-day (18 x 20 + 5) vague solar year (*xihuitl*), were well established by Toltec times and possibly much earlier. Most of the names employed for the twenty day-signs and apparently at least ten of the eighteen twenty-day periods, the "months," were the same as those used in the Aztec system. The major Toltec public ceremonies were undoubtedly geared to the eighteen months and followed the same basic ritual patterns as those current at the time of the invasion of Spanish forces under Hernán Cortés.

Archaeological evidence at Tula (ancient Tollan) and other Toltec-influenced sites, such as Chichén Itzá in Yucatán, demonstrates that Toltec religious architecture was essentially similar to that of the Late Postclassic. Basic continuities are manifest, especially in the forms of the temples and other sacred structures such as skull-racks (Nah., *tzompantli*) and small platform altars (Nah., *momoztli*). Certain specific Toltec traits, exemplified by *chacmools*, the reclining anthropomorphic images positioned in the vestibules of shrines, and reliefs of files of warriors decorating the faces of stone benches (banquettes) along the walls of rooms in struc-

tures adjoining the temples, were closely replicated in Aztec sacred architecture, most notably in the Templo Mayor precinct of the imperial capital, Mexico-Tenochtitlán.

After a series of disasters, the Toltec hegemony collapsed, probably in the late twelfth or during the thirteenth century, and barbarous newcomers, collectively known as the Chichimec, flowed in from the north. In the mid-fourteenth century a powerful new Basin of Mexico city-state, Azcapotzalco, arose. Under a remarkably vigorous ruler, Tezozomoc, the Tepanec, as the people of Azcapotzalco were called, established a central Mexican imperial system on the Toltec model. However, it did not long survive the death of Tezozomoc in 1426, and by 1434 the final pre-Hispanic political order emerged in central Mexico. This was headed by two former tributaries of Azcapotzalco, Mexico-Tenochtitlan and Tezcoco, joined, as a junior partner, by Tlacopan, an erstwhile ally of, and of the same Tepanec affiliation as, Azcapotzalco. This so-called Triple Alliance generated great military power and by the time of the Conquest dominated much of western Mesoamerica. Most of the leading ethnic-linguistic groups within this area had fallen completely or partially under its sway. The Tarascan of Michoacán, however, successfully maintained their independence and ruled a sizable empire of their own in western Mexico. Most of the Huastec-speaking communities, in the northeastern sector of Mesoamerica, also remained beyond Triple Alliance control.

AZTEC RELIGION. The following summary applies primarily to the Nahuatl-speaking communities of the Basin of Mexico and adjoining territory, whose culture is traditionally labeled “Aztec,” although fundamentally similar religious systems prevailed over a much more extensive area. Following this overview of the Aztec religious-ritual system, what is known concerning the religions of the major non-Nahuatl-speaking groups will be summarized, emphasizing aspects that appear to have been especially distinctive to each particular group.

Cosmogony and cosmology. Four great cosmic eras, or “suns,” were believed to have preceded the present age. The inhabitants of each era were destroyed at that era’s end—with the exception of single pairs that survived to perpetuate the species—by different kinds of cataclysmic destructions: respectively, swarms of ferocious jaguars, hurricanes, rains of fire, and a devastating deluge. The first era was assigned to the earth, the second to the air or wind, the third to fire, and the fourth to water. Different deities presided over each, and each age was also ascribed to one of the four cardinal directions and to its symbolic color. The last era, the Fifth Sun, was to be terminated, with the annihilation of humanity, by shattering earthquakes.

At the commencement of this final period, two major creative deities, Tezcatlipoca and Quetzalcoatl, dispersed the waters of the great flood and raised the sky, thus creating a new earth. Fire was next produced, followed by a fresh human generation. Quetzalcoatl traveled to the underworld, Mictlan, to obtain from its ruler, Mictlantecuhtli, the bones and ashes of previous human beings. With them the assem-

bled gods created the primeval human pair, for whom they also provided sustenance (above all, maize). A new sun and moon were next created by the cremation in a great hearth at Teotihuacán of two gods, one a diseased but courageous pauper and the other wealthy but cowardly, who were thereby transformed into, respectively, the orbs of day and night. The gods then sacrificed themselves to provide food and drink (hearts and blood) for the rising sun. But the sun’s terrible sustenance had to be supplied constantly to satisfy his insatiable appetite and unquenchable thirst. War, for the purpose of obtaining victims for sacrifice, was therefore instituted—and this perpetual obligation was laid on humankind.

The earth was conceived by the Aztec in a schematized geographic fashion and mystically and metaphorically as well. In the first conception the earth was visualized as a quadrilateral landmass surrounded by ocean. From its center four quadrants extended out to the varicolored cardinal directions, which, with the center, played a very important cosmological role as a basic principle of organization of numerous supernaturalistic concepts. At each direction stood a sacred tree upon which perched a sacred bird. In the fashion of Atlanteans, four deities supported the lowest heaven at each cardinal point. In the second terrestrial image, the earth was conceived both as a huge crocodilian monster, the *cipactli*, and as a gigantic, crouching, toadlike creature with snapping “mouths” at its elbows and knees and a gaping, teeth-studded mouth, called Tlaltecuhli, which devoured the hearts and blood of sacrificed victims and the souls of the dead in general. Both creatures were apparently conceived as floating on the all-encompassing universal sea.

There was also a comparable vertical organization of the universe. The heavens were conceived as a series of superposed varicolored tiers to which various deities and certain natural phenomena were assigned. The commonest scheme featured thirteen celestial layers and nine subterrestrial levels.

Gods. A crowded pantheon of individualized, essentially anthropomorphic deities was believed to control the various spheres of the universe. Almost every major natural and human activity was embodied in at least one supernatural personality. This plethora of deities was organized around a few fundamental cult themes. Within each theme can be discerned “deity complexes,” clusters of deities expressing various aspects of what amount to subthemes. Three major themes stand out: (1) celestial creativity and divine paternalism; (2) rain-moisture-agricultural fertility; (3) war, sacrifice, and the sanguinary nourishment of the sun and earth. Included within the first theme were such important deities as Ometeotl (Ometecuhtli/Omecihuatl or Tonacatecuhtli/Tonacacihuatl), the androgynous creative deity; Tezcatlipoca, the omnipotent “supreme god”; and Xiuhtecuhtli Huehuetotl, the old god of fire. Prominent within the second theme were Tlaloc, the paramount fertility deity and producer of rain; Ehécatl Quetzalcoatl, the wind god; Centeotl Chicomcoatl, the maize deity (with both male and female as-

pects); the *octli* (*pulque*) deity, Ometochtli, who had many individualized avatars, each with its own name; Teteoinnan Tlazolteotl, the earth mother, with many aspects; and Xipe Totec, the gruesome “flayed god.” The third theme featured Tonatiuh, the solar deity; Huitzilopochtli, the special patron of Mexico Tenochtitlán, who had strong martial associations; Mixcoatl Camaxtli, the Chichimec hunting and war god; Tlahuizcalpantecuhtli, the god of the planet Venus; and Mictlantecuhtli, the death god. Many minor deities presided over various crafts and occupations, the most important of which was Yacatecuhtli, the merchant deity. A major, protean god who defies neat categorization was Quetzalcoatl, whose creative function especially stands out and, as indicated, with whom a semilegendary Toltec ruler was inextricably entwined.

Ritual. The ritual system was intricate, variegated, and often highly theatrical. Some of the Spanish missionary ethnographers, influenced by Christian ceremonialism, divided the public, calendrically regulated rituals into those that were “fixed” (geared to the *xi-huitl*, the 365-day vague solar year) and those that were “movable” (geared to the *tonalpohualli*, the 260-day divinatory cycle). The eighteen “fixed” ceremonies, which were normally celebrated at the end of each “month,” or twenty-day period, together constituted the most important series of rituals in the whole system, closely linked to the annual agricultural cycle. Many were primarily concerned with fertility promotion and involved the propitiation of deities that most explicitly expressed this theme. The “movable” *tonalpohualli*-geared ceremonies were generally more modest in scope, but some were quite impressive, especially that which occurred on the day 4 Ollin dedicated to the Sun, which featured a strict fast and ritual bloodletting by the whole community. The sacrifice of war captives and condemned slaves and ritual cannibalism often, but not invariably, accompanied these major ceremonies. There were numerous other significant ritual occasions: key events in the life cycle of the individual, dedications of new structures and monuments, before and after battles, triumphs, investitures (especially royal coronations), and the like. There was also considerable daily domestic ritualism, centered on the hearth fire and the household oratory. Many ceremonies were also conducted in the fields by the cultivators.

The profession of the full-time, specialized priest, *teopixqui* (“keeper of the god”), was highly important. Practitioners were numerous and well-organized, with formal, hierarchical ranking. Much sacerdotal duty also devolved on “rotational priests” who served successive shifts for particular periods of time. Priests usually lived together, practicing sexual abstinence, in a monastic establishment (*calmeca*) in the temple compound. They were obligated to perform a rigorous daily round of offertory, sacrificial, and penitential exercises. Religious activities were focused on the temple (*teocalli*) and the sacred precinct, usually walled, within which it was situated. These precincts also contained the priestly dormitories and schools, sacred pools for purificatory bathing, skull

racks, platform altars, courts for the ritual ball game, giant braziers for perpetual fires, gardens and artificial forests, arsenals, and so on. The typical *teocalli* consisted of a solid, staged substructure with a balustraded stairway on one side. At the top was the shrine containing the image—of stone, wood, or clay—of the deity to whom the temple was dedicated. The space between the door of the shrine and the head of the stairs was the usual position for the sacrificial stone.

As indicated, the calendric cycles were intimately interconnected with the ritual system. The most basic cycle, the *tonalpohualli*, a permutation cycle of twenty days and thirteen numbers (totaling 260 days), was employed largely for divinatory purposes. Each day, which possessed an inherent favorable or unfavorable augury, was patronized by deities in two series, one of thirteen (“lords of the day”) and one of nine (“lords of the night”), plus the thirteen “sacred birds.” The days were also grouped into various divisions; the most common arrangement consisted of twenty periods of thirteen-day “weeks,” each of which was patronized, as a unit, by a deity or deity pair. These complex batteries of influences, for good or evil, were carefully taken into account by the diviners (*tonalpouhque*), particularly when “casting the horoscope” of the newborn child on the basis of the day of his or her birth.

No sharp division existed between the religious-ritual system that served the community as a whole and that was administered by the formally organized, professional priesthood and the more private system dominated by procedures usually defined as magical and practiced by “magicians” and diviners or, as anthropologists usually prefer to call them, shamans. Aztec shamanism was richly developed. Often neglected in general treatments of Aztec religion, its importance deserves special emphasis.

The most generic term for shaman was *nahualli*, also applied to his “disguise,” usually a kind of animal familiar into which he could transform himself. The power of the *nahualli* could be used for beneficial or harmful ends. The malevolent practitioner employed a variety of techniques to inflict harm on his victim, including the application of sympathetic magic to destroy the victim by burning his effigy. One of the most important activities of the benevolent shaman was divination. Aside from calendric divination, mentioned above, various techniques were employed: scattering maize kernels and beans, knotting and unknotting cords, scrying by peering into a liquid or an obsidian mirror, and so on. Divining by ingesting various hallucinogens was also practiced. Divination to ascertain the cause of disease was important in curing, which usually involved magical procedures, although many genuinely efficacious empirical therapeutic techniques were also employed. Both the intrusive-harmful-object and soul-loss concepts of illness were recognized.

Various illusionistic tricks were performed on occasion, such as animating wood images, burning structures without actually damaging them, and the shaman’s dismembering himself, also without inflicting real harm. Interpreting

omens, auguries, and dreams was another important function of the *nanahualtin*, who were frequently consulted at times of crisis. A famous example occurred after the arrival of Cortés, when a bewildered Motecuhzoma Xocoyotzin (Moctezuma II), the ruler of Mexico Tenochtitlan, turned to the diviners in desperation in an unsuccessful attempt to understand the implications of the sudden appearance of these strange newcomers on the shore of his empire.

The Spanish missionaries were generally successful in eliminating the established native priesthoods, but the individualistic practitioners of magic managed to carry on their activities with little interference. Their repertoire was actually enriched by their adoption of various congenial European magical practices. In the less-aculturated Mexican Indian communities of today, the basically indigenous shamanistic tradition still thrives.

TARASCAN RELIGION. The Tarascan-speakers, the Purepecha, centered in the modern state of Michoacán in the area around Lake Pátzcuaro, were a numerous and vigorous people who, contemporaneously with the rise of the Triple Alliance empire in central Mexico, built up a smaller but still sizable dominion in western Mexico that effectively blocked Aztec expansion in that direction. Pre-Hispanic western Mexico shared most fundamental Mesoamerican culture patterns but often expressed them in a distinctive fashion. The Tarascan religious-ritual system, which is only incompletely known, was typical in this respect. Compared to that of the Aztec, it appears to have been somewhat less elaborated, with a smaller pantheon and a simpler ceremonialism.

The most important deity seems to have been Curicaueri, the special patron of the Tarascan royal house. Curicaueri was connected with fire, the sun, and warfare, and he was symbolized by the eagle and a flint sacrificial knife. The Tarascan ruler was apparently considered to be his incarnation. Urendecuaucara, the god of the planet Venus, was also of some importance. Other significant members of the pantheon included a deity of *pulque*, a god related to the Aztec Xipe Totec, and a death god, in addition to numerous lesser deities, among them various local patrons. Two goddesses stand out: Xaratanga, an important fertility deity linked with Curicaueri, and Cuerauaperi, the old earth-mother goddess, seemingly cognate with the Aztec Teteoinnan Tlazolteotl (flaying and skin-wearing rituals were common to both cults).

The Tarascan priesthood was well organized, with a hierarchy of various specialists headed by an influential high priest. Like Aztec priests, the Tarascan priests wore badges of office and carried gourd vessels for tobacco pellets, but unlike Aztec priests they were not celibate. Shamanism was also well developed, and divination by scrying (peering into a liquid surface or a mirror) was of special importance. Tarascan temples (*yacatas*), consisting of straw-roofed shrines atop massive, partly circular, staged substructures, were sometimes large and elaborate (e.g., the five major temples at Tzintzuntzan, the imperial capital). Sacred images of both

wood and stone (and often portable) represented the major deities.

The ceremonial system featured fire rituals. In each temple was a perpetual fire, and even the ruler was obligated to cut and collect wood for these sacred fires. The principal ceremonies, during which the most prominent deities were propitiated, were geared to the standard Mesoamerican annual calendar ($18 \times 20 + 5 = 365$). The basic ritual patterns appear to have been quite similar to those of other Mesoamerican groups, featuring abundant offerings, human and animal sacrifices, and dancing.

OTOMÍ RELIGION. After the dominant Nahuatl-speakers, the Otomí constituted the most important group in central Mexico. Their center of gravity lay northwest of the Basin of Mexico, but they were also numerous, interdigitated with the Nahuatl-speakers, in the Basin itself. While Otomí were much deprecated, and considered backward rustics by Nahuatl-speakers, there actually seems to have been no sharp cultural division between the two groups. Their religious-ritual systems were quite similar, although that of the Otomí did exhibit some distinctive features. They clearly shared most of the leading deities of the pantheons of their Nahuatl-speaking neighbors.

A particularly important Otomí cult revolved around a fire-death god who bore various names—Otontecuhtli (“lord of the Otomí”), Xocotl, and Cuecucex—and who was merged with Xiuhtecuhtli Huehuetotl, the standard fire god of the Nahuatl-speakers. He was especially important in the cult of the Tepanec, who from their capital at Azcapotzalco had dominated a large area of central Mexico before the rise of the Triple Alliance. Indeed, Otontecuhtli was considered to have been the divine ancestor of the Tepanec, among whom the Otomian ethnic element was very strong. His particular annual ceremony featured various rituals surrounding the erection of a tall pine pole at the top of which was affixed a special, mortuary version of the god’s image formed of amaranth seed dough. Boys scrambled up this pole on ropes, competing to be first in grabbing the image. Both the Otomí- and Nahuatl-speakers called this ceremony the Great Feast of the Dead. It was also designated Xocotlhuetzli (“Xocotl falls”) by the Nahuatl-speakers, who had widely adopted it. An integral part of this ceremony was the sacrifice of a victim who was first roasted on glowing coals, then dispatched by the usual heart extraction method.

One source ascribes even greater importance among the Otomí to another deity named Yocippa. He can apparently be identified with Mixcoatl-Camaxtli of the Nahuatl-speakers, who was especially associated with the more nomadic, hunting lifestyle of the Chichimec, with whom some of the less sedentary Otomí were connected. His special annual feast probably can be equated with Quecholli, dedicated by the Aztec to Mixcoatl Camaxtli, which involved camping out in the fields and hunting and sacrificing deer and other game animals Chichimec-style. In the cult of the major Otomí center of Xaltocan in the northern Basin of Mexico,

during the fourteenth century a significant imperial capital in its own right before its conquest by Azcapotzalco, a lunar goddess was preeminent. Lunar deities also appear to have been important in the northeast Otomí-speaking region.

The overall Otomí ritual system was essentially similar to that of the Nahuatl-speakers. It also featured human and animal sacrifice, autosacrifice, incensing with copal and rubber, vigils, fasts, dancing, processions, chanting, and so on. Their calendric systems, including both the 260- and 365-day cycles, were also basically the same.

HUASTEC RELIGION. The Huastec occupied the northeast corner of Mesoamerica, mainly in northern Veracruz, southern Tamaulipas, and eastern San Luis Potosí. They spoke a language of the Mayan family, although their territory was separated from that of the other Mayan-speakers by a considerable distance. The Huastec were regarded by the Aztec as possessing numerous exotic traits: head deformation, filed teeth, tattooing, exaggerated nasal septum perforation for insertion of ornaments, yellow and red hair dyeing, no loincloths worn by males, tendency to drunkenness and general lewdness, and a reputation as great sorcerers, especially illusionists. Nahuatl-speakers had encroached on their territory, and some of their southernmost communities had been subjected to Triple Alliance imperial control. Most, however, were still independent—and often in conflict with each other—at the time of the Conquest.

Huastec religion is not well documented, but it appears to have been as richly developed as most Mesoamerican systems. The pantheon must be largely reconstructed from Aztec sources that refer to various deities associated with the Huasteca and that were represented wearing Huastec costume and ornamentation. The clearest example is Tlazolteotl Ixcuina, a licentious earth-fertility goddess, who was regularly portrayed with costume elements and insignia of Huastec type. It has been suggested that her alternate name, *Ixcuina*, may actually be a Huastec word meaning “lady of the cotton,” a substance with which Tlazolteotl was intimately associated and that flourished in the hot, humid lowlands of the Huasteca. Flaying rituals were important in her cult, and these also seem to have been an element in the Huastec ceremonial complex (possibly also reflecting the presence of a version of Xipe Totec).

Another important deity with strong Huasteca connections, both iconographically and in tradition, was the wind and fertility deity, Ehécatl Quetzalcoatl. The numerous *pulque* deities, with the common calendric name *Ome Tochtli* (2 *Rabbit*), were more connected in Aztec sources with the area south of the Basin of Mexico, centered on Morelos. But in the Codex Borgia group of ritual-divinatory pictorials, which probably originated in southern Puebla, western Oaxaca, or Veracruz, these deities typically display Huastec insignia. The alcoholic tendency attributed to the Huastec would support this connection. It is further evidenced by the survival in modern Huastec communities of the ancient deity of earth and thunder, Mam, also considered to be the god

of drunkenness. Another Aztec deity, Mixcoatl, usually ascribed to the Chichimec, the barbaric hunting peoples of the north, was also frequently depicted with patently Huastec features. Some version of this god, therefore, probably also figured in the Huastec pantheon.

Archaeological remains from the Huasteca, including engraved shell ornaments, stone images and reliefs, and wall paintings, evidence the presence of other deities, including a death god, whose identifications often remain obscure. Archaeological evidence also indicates that Huastec temples were often circular in form, both the staged substructures and the shrines on top of them. These have sometimes been connected with round temples dedicated to Ehécatl Quetzalcoatl, whose Huastec iconographic affiliations I have mentioned above.

The Huastec ritual system is barely known, but human sacrifice and autosacrifice are well attested both ethnohistorically and archaeologically. The modern survival of the Volador, or Flying Pole ceremony, indicates its ancient importance. There is also archaeological evidence for the existence of the 260-day divinatory cycle, while one colonial source lists a few apparent Huastec names for the eighteen twenty-day periods of the 365-day annual cycle. It seems likely, therefore, that, as elsewhere in Mesoamerica, the major Huastec ceremonies were geared to these cycles, but no further data are available.

TOTONAC RELIGION. The speakers of Totonac, a language unrelated to Nahuatl but perhaps remotely related to the Mixe-Zoquean and Mayan linguistic families centered farther to the east, occupied the lowland tropical area of central Veracruz, extending into the high mountains edging the Mesa Central to the west. At the time of the Conquest their principal community was Zempoala (Cempoallan) near the coast, the first large Mesoamerican urban center visited by the Europeans, a few days after Cortés’s landing farther south near the present city of Veracruz. Zempoala and most of the other Totonac-speaking towns had been conquered by the Triple Alliance some years earlier. Totonac culture patterns were basically Mesoamerican, reflecting strong influence from their Nahuatl-speaking neighbors and conquerors, but the Totonac also exhibited various distinctive features, some of which they shared with their northern Gulf Coast neighbors, the Huastec.

The rather thin amount of knowledge of pre-Hispanic Totonac religion derives from the incompletely known archaeology of the area and, especially, from a lost account, apparently written by the young page reportedly left at Zempoala by Cortés in August 1519 to learn Totonac. Preserved in part in three later missionary chronicles, this source describes a Totonac trinity of deities: the Sun, Chichini; his wife, the great mother-fertility goddess; and their son, who was expected to return at some future time as a kind of redeemer. The goddess might have been a version of Tlazolteotl-Ixcuina, known to have been important in the cults of the Gulf Coast groups, perhaps merged with the maize god-

dess. The son might be identified with the youthful male maize deity called Centeotl by the Nahuatl-speakers. Some Christian influence here seems obvious, but the basic nature of these deities might have been accurately reported with the possible exception of the redeemer aspect of the son. From archaeological evidence, principally at Zempoala, the cults of other deities are discernible, including those of Ehécatl Quetzalcoatl and Xochipilli Macuilxochitl. The latter, the Aztec young god of flowers, dancing, music, and sensuality in general, also had solar associations and overlapped with Centeotl. Undoubtedly the Totonac pantheon was much more extensive than this, but more specific information is lacking.

The early Spanish account mentioned provides some interesting information on the Totonac priesthood. A hierarchy of six major priests is described whose attire and functions were essentially similar to those of Aztec priests. Lesser religious functionaries assisted them, particularly in tending the sacred fires. The priests also instructed children between the ages of six and nine in the tenets of the religious-ritual system. The importance of two elderly penitent “monks,” dedicated to the cult of the “great goddess,” is stressed. Consulted regularly by the other priests as oracles, they lived in a retreat on a mountaintop, spending most of their time painting ritual books.

The same source describes various aspects of Totonac ritual, including incensing, fasting, circumcision, human sacrifice, autosacrifice involving the passing of straws through a perforation in the tongue, ritual cannibalism, confession of sins to a priest, and child sacrifice followed by the ingestion, “like the sacrament of communion,” of a concoction of rubber and seeds mixed with the young victims’ blood. The Totonac calendar appears to have been typically Mesoamerican. Although the key early account speaks of only three major ceremonies annually, all of which featured human sacrifice on a limited scale and ritual cannibalism, there is evidence that the usual round of eighteen principal ceremonies was celebrated at twenty-day intervals. The importance of the Volador ceremony is known from modern survivals. Archaeological evidence, especially at the site of Zempoala, demonstrates that Totonac temples were basically similar to those of the Aztec. The sacred images they contained seem to have usually been carved of wood. No specimens survive.

MIXTEC RELIGION. The speakers of Mixtec, a language remotely related to Otomí and closely allied to Zapotec, occupied an extensive region centered in western Oaxaca. Generally characterized by a very broken topography, the Mixteca featured numerous small city-states, politically autonomous but closely linked by an intricate network of dynastic marital alliances, a basically common language, and a shared religious ideology. Although it has recently been claimed by some scholars that the Mixtec religious-ritual system might have been quite different from that which prevailed in central Mexico, it appears to have been similar in most fundamental features. The influence of the adjacent Nahuatl-

speakers to the north was very strong in late pre-Hispanic times, and most of the Mixtec city-states were tributary to the Triple Alliance at the time of the Conquest.

No systematic account of pre-Hispanic Mixtec religion is available, but its basic outlines can be reconstructed from a variety of sources. Among these are an unusual wealth of pictorial histories that include much material relevant to the Mixtec pantheon, ritual system, cosmogony, and cosmology. What is known of Mixtec versions of their beginnings indicates that cosmogonical concepts were intertwined with dynastic origins and ritualized community foundations throughout the four quarters of the Mixteca. A “celestial prologue” to Mixtec royal history involved the creation by a primordial demiurge male-female pair (probably corresponding to the Aztec Ometecuhtli/Omecihuatl) of a culture hero, apparently also conceived in twin form, who iconographically and functionally closely resembles Ehécatl Quetzalcoatl of the Nahuatl-speakers. Descending from the celestial realm, he presided over dynastic and community initiations and consecrations and was apparently considered to have been the divine ancestor of Mixtec royalty. Other dynastic ancestors were believed to have emerged from a cosmic tree near the northern Mixtec community of Yutatnoho/Apohuallan (Apoala).

These semidivine ancestral heroes, as in the Nahuatl-speaking world, interacted closely with various deities, and no sharp line can be drawn between gods and men at this stage. Although it has been suggested that the central Mexican concept of deity, *teotl*, does not conform to its putative Mixtec equivalent, *ñuhu*, the two concepts were probably not dissimilar. In any case, the pictorial iconography of Mixtec supernaturalism was quite close to that of central Mexico. Costume elements and insignia of personages often bear striking resemblance to those of recognized Aztec deities. Each major Mixtec community appears to have had a special patron deity or deities, and the names (mostly calendric) of many of these are known. More than in any other Mesoamerican pantheonic system, the Mixtec supernaturals were designated, both in the texts and pictorially, by their calendric names. Only in part do they agree with their central Mexican counterparts. A number of their verbal names are also known, such as *Dzahui*, name of the basic rain and fertility deity, cognate with the Aztec Tlaloc.

Mixtec ceremonialism was richly developed, particularly that revolving around “sacred bundles.” Human sacrifice and autosacrifice were a regular part of propitiatory ritual. Here too the Volador ceremony was important, as was the ceremonial ball game played in formal I-shaped courts. The widespread cult of Xipe Totec, featuring flaying rituals, was well established in the Mixteca, including its attendant ceremony, the “gladiatorial sacrifice,” wherein the victim perished in ceremonial combat. As elsewhere, much of the ritual was calendrically regulated. Mixtec temples were often represented in the pictorials and were very similar to those of central Mexico. The holiest shrine of all, the Mixteca—seat of a far-

famed oracle—was located on a mountain top near Ñuudeco/Achiotlan in the heart of the Mixteca Alta—with a subsidiary shrine in a cave in the valley of Yodzocahi/Yanhuitlan to the north.

The Mixtec priesthood was well organized and influential. Candidates were ordinarily recruited when quite young from the ranks of the nobility and underwent a rigorous training for at least a full year as novices. All future rulers received this same sacerdotal education, also being required to serve their yearlong novitiate. Following their training, most future priests apparently returned to secular life and married until called to their term of office, during which they usually served a particular deity and were required to be strictly celibate. Maintained by the rulers and constantly consulted by them, in control of all “higher education,” they exerted great power in their communities. Shamanism was also well developed. Mixtec practitioners of magic and sorcery particularly specialized in calendric divination but also employed many other techniques, sometimes aided by ingestion of hallucinogens.

ZAPOTEC RELIGION. The Zapotec-speakers occupied an area of considerable ecological diversity in the eastern portion of Oaxaca. Like the Mixtec, who were close cultural and linguistic relatives, the Zapotec were not politically unified. In the Valley of Oaxaca, Zaachila/Teozapotlan dominated a wide area, and its political offshoot, Daniguibedji/Tehuantepec controlled much of the southern Isthmus of Tehuantepec. At the time of the Conquest most of the major Zapotec communities were tributary to the Triple Alliance.

The Zapotec heritage was an ancient one. Most students believe that the great Classic period (c. 100–700 CE) civilization of Monte Albán was mainly the creation of Zapotec-speakers. By the time of the Conquest, Zapotec supernaturalism was typically Mesoamerican in its richness and complexity. As in the case of the Mixtec, it has recently been suggested that the Zapotec lacked the concept of individualized anthropomorphic deities. It seems likely, however, that Zapotec religious concepts were not that different from those of other advanced Mesoamerican cultures. A large number of Zapotec names for what the Spaniards, at least, regarded as *dioses* (Span., “gods”) were recorded in various colonial textual sources. Some appear to have been appellations and general designations of godhead rather than proper names in the usual sense.

A typically Mesoamerican abstract, creative godhead was of considerable importance, known by various appellations: Coquixee, or Coquixilla (“lord of the beginning”), Piyetao (“great spirit”), and others, described in 1578 by Fray Juan de Córdova as the “god without end and without beginning, so they called him without knowing whom,” and “god of whom they said that he was the creator of all things and was himself uncreated.” Overlapping this deity was Pitao Cozaana (procreator) with an apparent female counterpart, Pitao Huichana (procreatrix). This Zapotec creative power was obviously cognate with a similar concept among the Na-

huatl-speakers, known, among other titles and appellations, as Tloque Nahuaque (“master of the near and the adjacent”), Ipalnemoani (“he through whom one lives”), and Ometeotl (“dual deity”).

The fertility theme, as usual, received special emphasis and was expressed by various supernatural personalities. Standing out was Cocijo (“lightning”), the fundamental male fertility and rain deity, cognate with the Aztec Tlaloc and the Mixtec Dzahui, along with Pitao Cozobi, a deity of maize and foodstuffs in general, cognate with the Aztec Centeotl. Pitao Xicala (Pecala), “god of desire and dreams,” would also seem to fit in this category; he has been equated with the Aztec Xochipilli-Macuilxochitl.

Apparently a widely venerated deity, sometimes even stated to have been the principal Zapotec god, was Pitao Pexelao, lord of death and the underworld. This deity was especially connected with the greatest of the Zapotec oracular shrines, Liobaa/Mictlan (Mitla), which provided a ritual focal point for the Zapotec communities in and adjacent to the Valley of Oaxaca. This god was also closely connected with the veneration of royal ancestors, whose tombs were prominently featured at Liobaa. The macabre Aztec “flayed god,” Xipe Totec, whose cult was virtually pan-Mesoamerican but was especially connected with the Oaxaca-Guerrero area, clearly played a role of some importance in Zapotec religion, although the local sources provide scant information. Many more names of ostensible Zapotec deities are extant, but their importance and precise functions are obscure. As was common throughout Mesoamerica, each community featured a special supernatural patron or patrons, including, at times, deified ancestors. These were sometimes important, widely venerated deities; in other cases their cults were apparently only local. As in the Mixteca, they were often designated by calendric names.

Zapotec ceremonialism seems to have displayed virtually all known major Mesoamerican ritual patterns, including human sacrifice and its attendant ritual cannibalism. Oracular sanctuaries, often in caves, were important. In addition to that at Liobaa, one famous cave was situated on an island called in colonial times Laguna de San Dionisio, east of Daniguibedji/Tehuantepec, the capital of the Isthmus Zapotec. Here the deity venerated as “the soul and heart of the kingdom” appears to have been an earth god, perhaps known as Pitao Xoo, and related to Tepeyolotl of the Nahuatl-speakers. The professional priesthood played an influential role in Zapotec society; it was headed by a high priest, *uijatao* (“great seer”), assisted by lesser functionaries: *copa pitao* (“guardians of the deities”), *ueza eche* (“sacrificers”), and *pizana* (or *vigaña*, “young or student priests”). Shamanistic diviners called *colanij* were also important, particularly in calendric divination. As elsewhere, much of Zapotec ritual was calendrically regulated, particularly the vital pancommunity fertility-promoting ceremonies geared to the annual agricultural cycle.

CONCLUDING REMARKS. This capsule survey of the religious-ritual systems of the major western Mesoamerican groups in the Postclassic period reveals that they all displayed numerous fundamental ideological and ceremonial similarities in spite of expectable regional differences in gods' names and ritual emphasis. The importance throughout western Mesoamerica of the two basic calendric mechanisms, the 260- and 365-day cycles, in ceremonial regulation and in divination, deserves special emphasis as a common ideological structure linking the various subregions. The question arises, therefore, as to whether one is dealing here with a single fundamental religious-ritual system with numerous regional variants or with various essentially independent systems that happened to share, due largely to historical contacts, most basic features. One way of addressing this question is to ask whether Aztec, Tarascan, Otomí, Huastec, Totonac, Mixtec, and Zapotec priests, if brought together (assuming an effective method of linguistic communication) to compare notes could adequately understand each others' cultic systems. The evidence appears to indicate that the similarities would have far outweighed the differences and that they might well have had no difficulty in basic comprehension. If this view is valid, the religions of these groups could be likened to an essentially common language divided into a number of mutually intelligible dialects—all of which would underscore the fundamental cultural unity of the Mesoamerican area co-tradition.

pp. 582–602. Austin, 1971. A well-documented account of what is known concerning Conquest period Huastec culture, including a brief but informative treatment of the religious-ritual system.

H. B. NICHOLSON (1987 AND 2005)

MESOAMERICAN RELIGIONS: COLONIAL CULTURES

The colonial period in Mesoamerica began with the founding of Spanish colonies in the 1520s to the 1540s and ended with the emergence of independent states during the 1820s. The Spanish Conquest and the imposition of colonial rule was often violent, disruptive, and accompanied by epidemic disease. In the long run, however, most Mesoamerican communities enjoyed local self-rule and flourished under the relative stability of the *pax colonial*. The native subjects of what the colonists called New Spain were exploited economically, but many aspects of native culture persisted under Spanish rule, influenced only gradually by contact with non-Mesoamerican cultures. However, the one dimension of Mesoamerican culture that Spaniards were implacably dedicated to destroying was its religion.

Arguably, therefore, the colonial institution that most profoundly affected indigenous life in Mesoamerica was the Catholic Church. Its impact was initiated by the earliest arrival of Spaniards in Mesoamerica; by the time Hernando Cortés and his men arrived in Tenochtitlan on November 8, 1519, for example, they had destroyed native temples, erected wooden crosses, and criticized indigenous religious practices, often against the advice of the Spanish priests in their company. Cortés's efforts were allegedly showcased during one of his first conversations with Moctezuma, the Mexica (or Aztec) emperor. According to Bernal Díaz, a Spaniard who accompanied Cortés, the Spanish conquistador sought out Moctezuma in his palace. There he promoted the worship of Christ, grieved about the Mexica worship of devils, and begged Moctezuma and his party to become Christian. Moctezuma's often-quoted reply was:

I understand what you have said to my ambassadors about the three gods and the cross, and what you preached in the various towns through which you passed. We have given you no answer, since we have worshipped our own gods here from the beginning and know them to be good. No doubt yours are good also, but do not trouble to tell us any more about them at present. (Díaz, 1963, pp. 222–223)

Moctezuma's response speaks to the Mesoamerican tendency to incorporate new religions into their own belief system rather than replace them. This incident foreshadowed indigenous responses to subsequent, more systematic evangelization efforts in Mesoamerica. As influential as the church remained throughout the colonial period, indigenous individuals and communities played an equally significant role in the development of Mesoamerican Catholicism.

THE SPIRITUAL CONQUEST. Coming in the wake of (or preceding) military invasions, campaigns of evangelization have often been viewed as manifestations of the Conquest. The best-known example of such a view is Robert Ricard's use of a term coined by colonial-era Franciscans, "spiritual conquest," in his seminal work on Christian evangelization efforts in Mexico, *La conquête spirituelle du Mexique* (1933). Since then, spiritual conquest has come to denote the methodical proselytization of indigenous Mesoamericans led by the mendicant orders—primarily the Franciscans, Dominicans, and Augustinians, but also the secular clergy and later the Jesuits. Although Ricard argues for the success of Christianization efforts in Mexico, scholars have challenged traditional assumptions about the evangelization of Mesoamericans, specifically the notion that native peoples were "spiritually conquered," since the 1970s. This work began with the study of the Nahuas of central Mexico. In 1974, for example, Miguel León-Portilla published the first study examining Nahua reactions to evangelization. Building upon this research, in 1982 J. Jorge Klor de Alva outlined a typology of diverse and complex Nahua responses to Christianity, and in *The Slippery Earth: Nahua-Christian Moral Dialogue in Sixteenth-Century Mexico* (1989), the anthropologist Louise Burkhart analyzed native-language catechetical texts, arguing for a reciprocal model of evangelization, essentially a Nahuatilization of Christianity (see also Dibble, 1974). Other scholars, working with texts in Spanish and Nahuatl, have reinterpreted indigenous responses to Christianity through the lens of resistance, subversion, and dissent, particularly in examining sacramental confession (e.g., Gruzinski, 1989; Klor de Alva, 1999). Not surprisingly, the development and treatment of native agency during the "spiritual conquest" parallels the progress of scholarship regarding native agency in other areas of the Conquest and colonialism.

Although priests accompanied the conquistadors in their earliest expeditions to the mainland (most significantly the Mercedarian Fray Bartolomé de Olmedo in Cortés's party), the effective Christianization of Mesoamerica did not begin until the arrival of the Franciscans in Mexico City, which rose on the ruins of Tenochtitlan as the capital of the viceroyalty of New Spain. In 1523, Fray Pedro de Gante (Peter of Ghent), a Flemish lay Franciscan, and his two priest companions were the first to arrive in New Spain. It was the 1524 appearance of twelve Franciscans in Mexico City, however, that initiated the systematic evangelization of Mesoamerica. Led by Fray Martín de Valencia, "The Twelve" landed at Veracruz and walked the entire distance to Mexico City. One of them, Fray Toribio de Benavente, changed his surname to Motolinía when he noticed natives pointing to his tattered garments and realized it was their word for "poor person." Motolinía's response exemplifies the Franciscan preoccupation with native language and culture that characterized Franciscan activity in the early colonial period and continued to some extent to its end. For their part, the Nahuas of Tenochtitlan were impressed by the reverence

with which Cortés and the other conquistadors received these men.

Mesoamericans witnessed the appearance of numerous mendicants in the early post-Conquest period. Another religious order, the Dominicans, sent a group of twelve friars to New Spain in 1526, led by Fray Tomás Ortiz. Because the Franciscans had already begun extensive evangelizing in the central plateau, the Dominican presence was confined to the valley of Mexico and the Zapotec and Mixtec lands, obliging them to base their evangelization efforts in Oaxaca. By the time a group of seven Augustinians, the third major mendicant order, reached New Spain in 1532, they found themselves relegated to the lands unoccupied by the other two orders. In these early years, the religious were among the only Spaniards living in the Mesoamerican countryside. When Spaniards eventually founded a permanent colony in Yucatan in the 1540s, it was likewise the Franciscans who led evangelization efforts and claimed the most lucrative parishes.

IBERIAN CHRISTIANITY. Understanding the Castilian Catholicism that the Spanish conquistadors and mendicants brought with them to Mesoamerica is essential to understanding the progression of the "spiritual conquest." This form of Roman Catholicism developed in the Iberian Peninsula in part due to the *Reconquista*, the eight-century-long struggle to expel the Moors, who had invaded the Visigoth kingdom in Iberia as new converts to Islam in 711. In 1492 the last Moors were driven from Granada, their remaining Iberian kingdom. Led by the expansionist central kingdom of Castile, the *Reconquista* represented a reinterpretation of the Iberian past and the promotion of the present as a Christian crusade, one that aggressively persecuted Jews and Muslims. Fresh from the unifying experience of fighting for Christian restoration in their homeland, sixteenth-century conquistadors and mendicants simply transferred their exclusionary mentality from Islamic ritual to Mesoamerican religious practices. Oftentimes they also possessed a militaristic approach to evangelization that was not adverse to the use of force for religious purposes. This attitude was reinforced by the doctrine that salvation resided in the Catholic Church alone as the true church founded by Christ. Not yet affected by the religious upheaval resulting from the secession of Martin Luther (in 1517), sixteenth-century Iberians nevertheless struggled with the presence of crypto-Jews who publicly professed Catholicism yet privately participated in Jewish rituals. It was from this crusading atmosphere that the conquistadors and mendicants arrived in Mesoamerica, intent on the complete conversion of the peoples they encountered.

Within the Franciscan order during the colonial period another form of spiritual urgency existed. Certain members of the order, often called Spiritual Franciscans (as opposed to Conventional Franciscans), embraced millenarianism, the belief in the imminent second coming of Christ, which they saw as dependant upon mass conversion of the newly discovered peoples in Mesoamerica. As John Leddy Phelan explains

in *The Millennial Kingdom of the Franciscans in the New World* (1956), Fray Gerónimo de Mendieta was the most notable colonial Franciscan advocate of this mystical interpretation of the Conquest. He based his ideology on the parable of the banquet in *Luke* 14:16–24. In addition to the host (whom Mendieta identified as Christ), the parable names three groups of people: the guests initially invited to the banquet who refuse to come; those from the streets who are invited in their stead; and those compelled to attend to fill the hall. According to Mendieta, these groups represented the Jews, the Christians, and the Gentiles in Mesoamerica respectively, with the understanding that once the last group had entered the hall (i.e., become Christian), God's plan for the world would be fulfilled and it would come to an end. The influence of this belief among the Franciscans persisted until late in the colonial period, evidenced by Fray Junípero Serra's founding of his California missions in the northern frontier of New Spain in the eighteenth century. Not all Franciscans advocated millenarianism, but for those who did, evangelizing the natives in Mesoamerica was seen as an extraordinary opportunity to become active participants in the unfolding of God's eternal plan.

ESTABLISHING CHURCHES IN MESOAMERICA. Rather than implement a completely new system of church buildings and dioceses in Mesoamerica, the friars turned existing native communities into parishes and deliberately constructed churches upon the ruins of Nahua, Mixtec, and Maya temples. Mexico City's cathedral, for example, was erected adjacent to the foundation of Tenochtitlan's central temple. In many instances, the temple's ruins provided the construction materials as well as the site for the new Christian church. In important native towns such as Cholula (central Mexico) and Izamal (Yucatan), churches were built on top of the preserved pyramidal platforms of former temples using the same stones. Not only did the mendicants raze Mesoamerican temples and rebuild Christian churches, but they also destroyed images associated with native religious practice and dismantled the native priesthood—inadvertently driving its remnants underground. Afraid of what might be contained in “pagan” religious documents, the friars confiscated and burned numerous native codices. This method ensured a rapid transition to Christianity—at least outwardly—that allowed the more pressing matter of evangelization to begin; its unintentional side effect was to stimulate complex and largely clandestine native attempts to reconcile aspects of the new religion to old beliefs and practices. These efforts were viewed as heretically recidivist by the Spanish priests who discovered them; they also believed that hieroglyphic and painted books aided such spiritual resistance.

The friars' motivation for establishing churches in this manner was both pragmatic and symbolic; they desired to extirpate any native attachment to paganism and idolatry (which were more or less the same in Mesoamerica, due to the devil's influence, according to the Jesuit Fray José de Acosta), and to eliminate any reverence for previous Mesoamerican holy sites. On a spiritual and psychological level

the friars hoped to channel Mesoamerican religious loyalty towards Christianity and its manifestation by erecting new structures on traditionally sacred land. For the mendicants then, new church buildings served as powerful symbols of the spiritual superiority of Christianity and the permanence of its establishment. Not surprisingly, Mesoamericans often used their own religious language to identify these new structures; the Nahuas referred to the church as *teocalli* (sacred house) and the Mayas used the word *kuna* (god-house). They also imbued new churches with local cultural and political meaning, painting and decorating them elaborately (in Mexico) or adding impressive towers (in Yucatan and in the Mixteca) with an enthusiasm that friars interpreted as spiritual zeal, rather than as a continuation of the competitive community pride that had given rise to pyramids and other monumental pre-Conquest structures.

During the colonial period, native parishes were called *doctrinas* (doctrines) rather than *parroquias* (parishes) to emphasize indigenous status as neophytes engaged in the process of conversion. This also differentiated native religious communities from local Spanish churches. Because of the limited numbers of Spanish clergy in Mesoamerica, only the larger urban native communities had resident priests; smaller towns would receive only occasional visits from a priest living nearby, at which time he would celebrate Mass, baptize those born since his last visit, hear confessions, and preside at weddings. Certain Mesoamerican communities criticized negligent or incompetent clergy whose visits were infrequent or whose lackadaisical attitude resulted in mediocre spiritual attention. Accusations of physical abuse or sexual molestation by priests, as well as complaints that clergy charged exorbitant fees to administer the sacraments, surfaced with some regularity. Those priests who were dedicated, particularly if they were fluent in the native languages of these communities, remained in high demand throughout the colonial period. In 1567, for example, Maya parishioners petitioned the king to send them Franciscans who “speak well to us, truly and clearly preaching to us, [and] wish to learn our language here,” but not secular clergy, who spoke no Maya and “really ask and ask for a great deal of money” (quoted in Restall, 1998, pp. 160–165). Native community *cabildos* (town councils) made skillful and often successful use of their access to the colonial legal system to petition for the removal of abusive, negligent, or unpopular priests.

NATIVE LANGUAGES AND CHRISTIANITY. From its earliest interactions with native Mesoamericans, the church evangelized them in their own languages, a policy that was formally accepted at the First Mexican Provincial Council in 1555. Members of the religious orders developed extensive linguistic and cultural training programs both in the New World and in Spain. Beyond the immediate goals of communicating with the natives under their care, preaching to them in the open patios of their churches, and hearing their confessions, the friars ultimately sought to understand native culture and religious practice in order to identify and eradicate it. Knowledge of local custom and language also enabled

them to compose new sacred texts such as catechisms and instruction manuals for confessors that replaced the burned native codices. The mendicants developed native-language dictionaries and grammars by establishing schools where they trained male nobles and their sons to write their languages in the Roman alphabet. In the sixteenth century alone, numerous native-language dictionaries, confession manuals, grammars, catechisms, and dramas were published.

The Franciscans dominated linguistic and ethnohistorical studies in the colonial period (native complaints that priests did not speak the local language tended to be leveled against secular clergy). Some of the most important native-language work was done by the Franciscan Bernardino de Sahagún, who arrived in Mexico in 1529 and remained until his death in 1590. Sahagún devoted his life to a methodical study of native history, customs, and language, using a cadre of native assistants to produce a monumental, twelve-volume work, the *Historia universal de las cosas de Nueva España*. Usually referred to as the *Florentine Codex*, these volumes remain an invaluable resource for numerous aspects of fifteenth- and sixteenth-century Nahuatl (especially Mexica) culture and history; their study has become a veritable subfield of scholarship, complete with a debate on whether Sahagún's project was essentially medieval (e.g., Browne, 2000) or modern (e.g., Klor de Alva et al., 1988).

The challenge of indigenous language acquisition remained more complex than simply translating Spanish texts into native languages. The translation of Christian doctrine and such concepts as the Trinity and the Eucharist required careful attention to the nuances of individual native languages. Spanish clergy often resorted to incorporating words such as *Dios* (God), *Espíritu Santo* (Holy Spirit) or *obispo* (bishop) into their sermons or sacred texts, hoping—often in vain—that by introducing a foreign word the concept would remain purely Christian. When the friars did use native words, however, the result was often ambiguous. For example, the Nahuatl word that was used to convey the Christian idea of “sin,” *ilahlacolli*, meant “destruction, error, or crime,” while the word used for “devil,” *ilacatecolotl*, meant “owl-person,” a Mesoamerican malevolent night creature who could make people sick, sometimes fatally. Similarly, the terms Dominican friars used to convey Christian concepts in Nudzahui, the Mixtec language, illustrate the linguistic and conceptual difficulties that priests experienced in replacing pre-Conquest religious ideas with Christian ones: “idolater” was *tay yoquidzahuico*, “person who makes feasts”; and “the devil” was *tiñomi ñaha*, “owl-person,” or *ñuhucuína*, “deity who robs or tricks.” Understandably, Mixtecs accused of sins or crimes in the sixteenth century sometimes claimed that “the devils deceived me” (quoted by Terraciano, 2001, p. 304).

THE NATIVE CLERGY DEBATE. In the early post-Conquest years, from about 1521 to 1542, the majority of churchmen, both religious and secular, looked favorably upon the prospect of ordaining native clergy. Spanish priests and lay broth-

ers generally considered natives capable of Christianization and education, as well as full cultural Hispanization. In particular, the Franciscans believed that “Indians” were raw material waiting to be formed in the Christian faith, and that God had given the Franciscan Order a unique opportunity to bring souls to Christ to counterbalance the numbers who were leaving the church to follow Luther. Given this attitude, it is not surprising that the 1532 *Junta Apostólica*, a quasi-official gathering of clergy who met to draw up guidelines for New Spain's young church, made a statement in favor of the native capacity to accept Christianity. More importantly, this *Junta* took the preliminary steps toward approving natives for priestly ordination by declaring that educated natives and mestizos could be admitted into the minor orders, a preparatory step toward the priesthood. Despite these favorable beginnings, the *Junta Apostólica* of 1544 declared that native peoples could never be fully civilized and Christianized. Furthermore, the First Mexican Provincial Council of 1555 not only forbade the ordination of natives to the sacramental priesthood, but also prohibited them from touching the sacred vessels. The official church position regarding native clergy in New Spain reflected the attitudes present throughout Mesoamerica, so that with very few exceptions—in some Jesuit missions or frontier regions—native men were not allowed to become priests (see Poole, 1989).

Among the secondary schools founded in Mesoamerica, the Franciscan College of Santiago Tlatelolco played the most significant role in the native clergy debate. Established in a Mexico City neighborhood in January 1536, the school trained the sons of Nahuatl nobles in reading, writing, music, Latin, rhetoric, logic, philosophy, and indigenous medicine. Given the Franciscan position in the debate, the student body, the daily educational structure, and the subjects offered, this school appears to have been intended as a seminary. Although its numbers grew in the first year, by the 1570s the project was abandoned; not one of its students received holy orders. The persistent opposition of the Dominicans, the secular clergy, and the general Spanish population to the college's goals may have contributed to its demise. Within its brief existence, however, the Franciscans' most beloved student was a Nahuatl named Antonio Valeriano, a brilliant Latinist who became one of Sahagún's collaborators. In sharp contrast to Valeriano was a former Tlatelolco student named don Carlos of Texcoco, a native leader accused of heresy and executed in 1539 by Fray Juan de Zumárraga, an inquisitor and the first bishop of Mexico City.

THE ROLE OF THE INQUISITION IN MAINTAINING CHRISTIANITY IN MESOAMERICA. From the 1530s to the 1560s, Inquisition-like proceedings, usually led by Spanish bishops, often resulted in the torture and execution of Mesoamericans accused of heresy or idolatry. One of the most extensive—and, eventually, infamous—of these proceedings was the campaign to extirpate idolatry in Yucatan led by the Franciscan Fray Diego de Landa in 1562, during which some four thousand Mayas were interrogated under torture (hundreds died). The much-publicized execution of don Carlos, of

which most crown and church officials disapproved, instigated a debate that was settled in the wake of Landa's auto-da-fé; Spanish policy finally recognized the inappropriateness of subjecting a people in the process of learning Christianity to inquisitorial persecution as heretics. Importantly, the church defined a heretic as a baptized person who obstinately denied some aspect of Catholic doctrine, a condition that did not apply to most indigenous neophytes. Removing natives from persecution also reflected a common paternalistic attitude towards Mesoamericans that persisted among clergy throughout the colonial period. Nevertheless, in remote regions native priests continued to practice traditional rituals quite openly, although many were prosecuted. For example, a Mixtec priest named Caxaa, arrested in 1544, testified that he and two colleagues had continued to perform rites such as human sacrifice since before the Conquest.

Consequently, when the Holy Office of the Inquisition was formally established in Mexico City in 1571 to uncover and penalize crimes against Catholicism, native people were exempt from prosecution. Although Mesoamericans did not fall under Holy Office jurisdiction, the bishop-controlled *Provisorato de Indios* (also known as the *ordinario*) monitored religious adherence in native communities. The church's policy toward indigenous Christians remained in effect until the Inquisition was dissolved in the nineteenth century.

OFFICIAL INDIGENOUS PARTICIPATION IN COLONIAL CHURCH LIFE. Although native men could not enter the priesthood, and the early decades of evangelization were often accompanied by violent campaigns of extirpation, Mesoamericans exercised considerable control over their religious lives during the colonial period. Not only were churches built on pre-Conquest holy sites, but friars preserved aspects of Mesoamerican religious social and political structure. Again, this decision was motivated by practical concerns, since there were so few priests available to administer to the thousands of native parishes scattered throughout Mesoamerica.

Within each parish the mendicants appointed a hierarchy of native officials to hold positions of importance. This hierarchy was usually drawn from the community's male elite; both before and after the Conquest, elite men represented local noble families, enjoyed privileged access to political office, and were responsible for organizing activities around the temple and palace complex (pre-Conquest) or parish church (post-Conquest). They became lay catechists who were trained by the friars in the basic tenets of Christianity, instructed in the Spanish language, and expected to assist in the recitation of the daily office. When Spanish priests were not present these native officials handled most of the day-to-day affairs in their church, organized the community religious festivals, and otherwise supervised matters of faith in the parishes. With this system the mendicants found yet another method of easing the transition between Mesoamerican religious ritual and the introduction of Christianity. By reinforcing the pre-Conquest Mesoamerican

inter-association of religious and political offices, friars also reinforced the status of local elite families at a time when socioeconomic differences among natives were lessened by colonial exploitation.

Each parish hierarchy consisted of several specialized positions. The *fiscal* was the most important religious official; he acted as the priest's assistant or deputy. His duties included overseeing local matters such as teaching catechism to the parish children, monitoring the village Mass attendance, and updating the parish birth, marriage, and death records. The parish records that have survived are now some of the most valuable sources of information for historians studying family structures, naming patterns, and demography. Other religious officials included the *sacristanes* (sacristans), who supervised the upkeep of the church buildings and who, with the *maestros de capilla* (chapel choirmasters), translated prayers and hymns into native languages for use during Mass.

Music was an integral part of daily church life, particularly during Mass and other services, so that the native position of *maestro de capilla*, or alternately the *maestro de coro* (choirmaster), brought considerable status. For his services the choirmaster occasionally enjoyed such privileges as tribute exemption and might receive a small salary. Often, the other native members of the parish choir (i.e., the singers and musicians) shared these benefits. Despite this honor, native salaries did not compare to the wages received by choir members in the Spanish parishes. In addition to these important religious officials, several minor religious positions existed that often varied by parish. In Nahua (and even in some non-Nahua) parishes, the Nahuatl term *teopan tlaca* (church people) labeled those responsible for such tasks as preparing bodies for burial, digging graves, cleaning the church, and decorating the altar with fresh flowers and other seasonal adornments.

Over time, the elite members of these religious hierarchies—as native representatives of the church—became a link between the local communities and the regional Spanish representatives of the church. They also interacted on the community's behalf with crown representatives of the Inquisition and *Provisorato* responsible for monitoring the purity of the faith. Influential in their communities and benefiting from their position as representatives of the crown, native elites became instrumental in shaping church doctrine and developing devotional practices according to local custom.

COFRADÍAS. Because parish hierarchy was limited to the native male nobility, the most important institution in native religious life was the *cofradía* (confraternity, religious brotherhood, or sodality). Everyone was welcome to participate in *cofradías*, including women and children. Importantly for women, they could assume informal leadership roles in a manner unavailable to them within the parish hierarchical structure, thereby gaining community status while actively participating in local religious life. Already widespread in Europe, the *cofradía* gained popularity rapidly in Mesoamerica,

even as it adapted to local custom. These voluntary organizations of local residents devoted themselves to some aspect of Catholic belief, devotion, or to a particular saint. A *cofradía* dedicated to the Virgin Mary, for example, could focus on the assumption, the rosary, the immaculate conception, or any of her numerous forms. If a *cofradía* chose Christ as its patron, it might be devoted to the child Jesus, the passion of Christ, or the Eucharist. Small villages usually had only one or two confraternities; larger towns could support a dozen confraternities; and cities might have several confraternities associated with each local church.

Since each confraternity was responsible for sponsoring a public religious celebration associated with its devotion, the name of the confraternity became important in dictating the schedule of community festivals. If a *cofradía* was dedicated to the assumption of the Virgin Mary, for instance, the Virgin's image would be carried in an elaborate procession through the streets on August 15. The members of the *cofradía* might even sponsor and reenact the event by configuring a platform with pulleys to raise an actress posing as the Virgin heavenward while onlookers sang a Marian hymn. The souls in purgatory, another popular devotion among confraternities, would celebrate its feast day on November 2, All Souls' Day. In addition to the standard procession, this celebration might include a visit to the local cemetery with offerings of food and flowers or a donation to the priest to offer Masses for the souls of departed relations.

These elaborate religious celebrations were financed by the confraternity's treasury, to which each member contributed yearly dues. These funds were often invested in *cofradía* properties or other enterprises, such as cattle ranches. The treasury was also used to cover the cost of members' funerals, to sponsor Masses for the souls of the dead, and to purchase flowers, candles, costumes, and other accessories necessary for religious celebrations. Additional duties included caring for images in local churches and manufacturing priestly vestments and processional platforms to be used when religious images were carried outside the church. Along with their spiritual duties, members attended to the physical needs of other members, particularly orphans and widows. *Cofradías* were by no means exclusively native organizations, however, since each group was formally instituted and overseen by the Catholic Church. Nevertheless, at a local level they allowed communities to unite and organize their own religious festivals, and they offered a counterbalance to the spiritual leadership of the local foreign priest. As economic and political organizations, as well as social and religious ones, Mesoamerican *cofradías* were connected to all aspects of native life.

THE QUESTION OF NATIVE CONVERSION. The existence and popularity of *cofradías* implied a homogeneity within native communities that did not always exist. Although most natives were baptized within decades of Spanish rule, throughout the colonial period priests complained that Mesoamericans resorted to their prior beliefs even after appearing to

accept Christianity. In 1588, for example, a Jesuit criticized his native parishioners for worshiping Christ only at the urgings of priests or judges; he disapproved of their apparently superficial veneration and doubted they believed the faith wholeheartedly. Clerical responses to the problem of native conversion ranged from a paternalistic pardoning of their actions as childlike confusion and innocent misunderstanding to fiery allegations of inherent indigenous laziness, incompetence, malicious intent, or even possession by the devil. The aspirations of the mendicants who arrived in the sixteenth century intending to convert Mesoamericans within a generation or two were never realized. In fact, localized versions of Christianity influenced by native practices continue to evolve in Mexico and Guatemala today.

The numerous similarities and possibilities for identification between native religions and Christianity complicated attempts to determine the sincerity of native conversion. For example, in addition to the successful introduction of the *cofradía*, the Christian cult of saints gained popularity throughout Mesoamerica. The patron saint of the local church became the symbolic head of the community, replacing or even merging with the area's pre-Conquest deity. Mesoamericans at times organized religious feasts for these saints, who were listed on the new Catholic calendar, on days devoted to deities in their own religious calendars. Similarly, during the colonial period the identity of Christ was often associated with one of the manifestations of the ancient sun god. Despite the outward appearance of Christianity and the efforts of the Spanish priests, pre-Conquest beliefs remained in wide circulation.

Even if Mesoamericans wanted to accept the Christian belief system, misunderstanding or reinterpreting Catholic concepts in terms of their own cultural and ideological principles was inevitable. Significantly, many fundamental Christian principles had no Mesoamerican equivalent—concepts such as heaven, hell, and the devil. With respect to the latter, for example, Fernando Cervantes has shown that the pre-Conquest Mesoamerican belief that notions of the demonic and the divine were “inextricably intertwined” contributed to early colonial diabolism (Cervantes, 1994, p. 40). When priests confronted Mesoamericans caught in apparent anti-Christian activities, the native defense was often to claim deception by the devil; in the 1530s, for example, Andrés Mixcoatl made such a claim when arrested for casting spells and claiming to be a god, as did Tacaetl for making rain sacrifices to the devil, and Culoa Tlaspicue, who claimed to be a prophet responsible for “the care of the devils” (Cervantes, 1994, p. 46). These men were not simply resisting Christianity, but attempting to reconcile the new religion with old practices and beliefs—to preserve sacrifice, which was so important to Mesoamerican religions but which the friars insisted was the work of the devil.

Thus the cultural divide that existed between Spanish priests and their native parishioners prevented either side from engaging in dialogue on an equal plane. For the priests,

conversion was an act of exclusionism, but for Mesoamericans, accepting Christianity did not signify a rejection of prior beliefs, since incorporating the gods of their conquerors into their own systems of belief was an orthodox religious practice. For this reason, even as Catholicism outwardly replaced indigenous religion, ancient practices often combined with Christian forms to develop into highly individualized local traditions. The paucity of priests in Mesoamerica throughout the colonial period contributed to the inconsistent native response to Christianity, so that the Christianization process in the sixteenth and seventeenth centuries was often a confused and reactive one; natives in rural communities responded in unorthodox ways to inadequately explained and alien concepts, then absentee priests responded in turn when these unorthodoxies created local tensions.

The religious syncretism that often emerged from native responses to evangelization had larger cultural implications. Priests sought to regulate not just belief and ritual, but also family life, gender relations, and sexual identity; in these areas too, native ideas and practices persisted while being gradually influenced and altered by Catholic culture. Scholars examining native conversion continue to uncover indications of personal decisions and forms of devotion by colonial Mesoamericans. These are illustrated by the explanation made to the Dominican fray Diego Durán by an “idoltrous” Nahuatl native that natives were “still *nepantla* . . . which means, to be in the middle” (quoted in Burkhart, 1989, p. 188; Cervantes, 1994, p. 57). Scholars have interpreted *nepantlism* variously as a form of syncretism, as representing a middle ground between faiths, as reflecting the lack of a middle ground between mutually exclusive alternatives, or as a panacea for myriad personal accommodations. Personal responses are also revealed in baptism patterns (which cannot solely be explained by priestly activity, since natives often requested the sacrament for religious, social, or political reasons), in the religious formulas that open the testaments dictated and recorded in Mesoamerican languages (formulas based on Spanish models but exhibiting local and even individual variations that hint at personal piety), and in the keeping and bequeathing of saint images.

Indeed, the prevalence of personal syncretic devotions remains most evident within the private rather than the public sphere. At the household level, a family altar became the center of religious devotions. Called *santocalli* (saint’s house) in Nahuatl, Christian images such as saints, rosaries, and crucifixes were displayed alongside figurines associated with indigenous deities without concern for religious inconsistency. Families gathered before these altars to recite Christian prayers in their native languages, to make offerings of flowers or food, and to clean and sweep around it. These altars even became the focus of native wills that specified the types of offerings and reverence the inheritor was to perform.

THE PERSISTENCE OF FOLK RELIGIOUS CULTURES. Mesoamerican altars were only one aspect of native folk religion that developed in the colonial period and that continues to

this day. Indigenous curers, midwives, and conjurers maintained their practices after the introduction of Christianity, often with the inclusion of Catholic prayers, rituals, or objects. Kevin Terraciano’s observation that “conventional European distinctions between priests and sorcerers, religion and magic, did not apply in the Mixteca” was true to some extent throughout Mesoamerica (Terraciano, 2001, p. 271). The confusion created by Christianization further blurred the line between native medicinal practices and the persistence of Mesoamerican religion at the folk level—as well as that between medicinal practitioners or healers and the underground post-Conquest native priesthood. The abovementioned Andrés Mixcoatl, for example, confessed to the Inquisition that he had preached that “the [Franciscan] brothers’ sermons were good for nothing, that I was a god, that the Indians should sacrifice to me.” (quoted in Gruzinski, 1989, p. 36), but he also behaved much like the shamans who could be found in many regions of Mesoamerica throughout the colonial period and beyond—practicing divination with grains of corn (a Maya *h-men* might have used cacao beans), healing the sick, and using hallucinogens such as mushrooms.

Mixcoatl was but one of hundreds of non-Spaniards investigated by Inquisition or *Provisorato* priests for crossing over, in speech and deed, the religious lines drawn by the church in New Spain in its Sisyphean efforts to forge Catholic orthodoxy. The patterns contained in these cases are still being studied by scholars, but the following simplification may be made: in the sixteenth century, Spanish priests were more likely to associate native shamanism with idolatry; in the seventeenth century they were more likely to condemn shamanism as witchcraft or as superstition. This gradual shift reflected the ongoing syncretism of Mesoamerican religion and Christianity with unorthodox native practices less readily identified by Spaniards as idolatrous; it also reflected the impact of African folk religious and healing practices as the quarter of a million black slaves imported into New Spain before 1650 and their Afro-Mexican descendants began to mix culturally and biologically with Mesoamericans.

THE TZELTAL REVOLT. Although most Mesoamericans accepted Christianity at least outwardly, the colonial period witnessed numerous resistance movements among native peoples. Many forms of dissent remained personal, such as refusal to accept baptism, persistence in polygamous relationships even after promising Spanish clergy to become monogamous, or refusal to attend religious services. Yet even when resistance became communal, Mesoamericans usually sought to form their own Christian cults that incorporated native beliefs rather than completely reject Catholicism. Localized native resistance may be read as an assertion of the right to govern local religious development rather than rely on a foreign (i.e., nonlocal) clergy. Rebellions typically began as a reaction against negligent or abusive priests, and generally centered on an individual who appropriated the identity of the Virgin Mary, Christ, or another saint.

One of the most well-known religious rebellions took place in Chiapas in 1712 among the Tzeltal Maya. Often called the Tzeltal Revolt, this event remains unusual, for although small local riots and revolts were commonplace, large regional revolts such as this, amounting to a localized revolution in ideological terms, were not. The revolt began when the Virgin Mary appeared to a thirteen-year-old Tzeltal Maya girl named María López (later known as María de la Candelaria) as she walked along the outskirts of Cancuc. María's father, Augustín López, a sacristan in his community's parish, was instrumental in advertising the miracle and gaining local support to build a small chapel on the site at the Virgin's request. Fray Simón de Lara, the Dominican priest assigned to Cancuc, investigated the event, denounced it as instigated by the devil, and flogged María and Augustín. He did, however, allow the chapel to remain.

Events escalated quickly; later that month several citizens from Cancuc were imprisoned after they traveled to Chiapas to ask the bishop's permission to maintain the chapel. Religious authorities also imprisoned Cancuc's civic leaders, but their prompt escape only served to strengthen the cult. Its members removed the Christian images from their local church, placed them in their own chapel, and proceeded to participate in a ceremony imitating Mass during which native priests were ceremoniously ordained. A letter signed by "the Most Holy Virgin Mary of the Cross" circulated among the townspeople encouraging them to revolt against Spanish rule since there was neither God nor king.

The people of Cancuc were joined in the Tzeltal Revolt by twenty neighboring native villages. These rebels not only raided Spanish towns, killing clergy and militiamen and forcing women to marry Maya men, but they also attacked indigenous towns that remained loyal to the colonial regime. Their movement was eventually repressed by a Spanish and native army and its leaders flogged or executed; Cancuc was razed and its residents forcibly resettled. By February 1713, nine months after the apparition outside Cancuc, the last of the rebel leaders abandoned the cause, and the Spaniards initiated strict laws regarding apparition stories or claims of miraculous occurrences.

THE VIRGIN OF GUADALUPE. Significantly, the two most successful religious devotions to emerge from the colonial period in Mesoamerica, the cults of the Virgin of Remedies (La Virgen de los Remedios) and the Virgin of Guadalupe, were not born in revolt. Both have been, at various times, highly controversial, but nonviolent debate seems to have encouraged rather than diminished the popularity of, and a widespread devotion to, these Virgins—especially Guadalupe—that has persisted to this day.

The Virgin of Remedies has enjoyed several phases of devotion in central Mexico. She first appeared during the Conquest, allegedly assisting the Spaniards against the Mexica during the war of 1519 to 1521. Twenty years later she appeared to a Nahuatl nobleman, Juan de Tovar, who maintained a shrine to her, at first in his home but later among

the ruins of a pre-Conquest temple on Tetoltepec hill. Then, in the 1570s, the Mexico City council appropriated this cult, founded a new church and *cofradía* for her, and made her the patron saint of the city. Over the following half-century, despite competing stories relating to the appearance of the Virgin and numerous lawsuits over the shrine, the image of a benevolent Mary associated with local Nahuatl followers gradually replaced the earlier Conquest-related Virgin of Remedies. In other words, "the symbolism of Remedies was altered to correspond to changing colonial reality" (Curcio-Nagy, 1996, p. 374). By 1700, the statue of the Virgin had been carried into Mexico City nineteen times; she made the journey another thirty-two times between then and 1810, while a second image of her, known as the *Peregrina*, made regular visits to native communities in and around Mexico City, many of which also claimed her as their patroness. The Virgin of Remedies was eventually replaced, at both an official and popular level, by Guadalupe, but her festival—featuring native dance performances—still takes place on top of Tetoltepec hill.

From its earliest days in the sixteenth century, when a small shrine to the Virgin of Guadalupe was dedicated at Tepeyacac hill outside Mexico City, the devotion to Guadalupe divided the Spanish clergy, disrupted communities who embraced it, became the topic of passionate sermons and polemical colonial writings, as well as the subject of hundreds of colonial paintings. The reason for the Guadalupe debate was and continues to be the lack of contemporary historical evidence to support the tradition's origins. In fact, the first extant source that references the Guadalupe story is *Imagen de la Virgen Maria, Madre de Dios de Guadalupe* (Image of the Virgin Mary, Mother of God of Guadalupe), a Spanish account written in 1648 by a Spanish Mexican priest named Miguel Sánchez. The following year, a priest named Luis Laso de la Vega published a similar account in Nahuatl, known as *Huei tlamahuicoltica* (and whose full title translates as "By a great miracle the heavenly queen, Saint Mary, our precious mother of Guadalupe, appeared here near the great Altepétl of Mexico in a place called Tepeyacac"), which was destined to replace Sánchez's version as the standard apparition account.

According to Catholic tradition, popular Mexican belief, and these accounts, the Virgin Mary appeared to a widowed 57-year-old Nahuatl peasant and recent convert named Juan Diego as he walked to Tlatelolco for Saturday morning Mass. After departing from his village of Cuauhtitlan on December 9, 1531, Juan Diego suddenly heard the singing of many birds as he passed Tepeyacac hill near Mexico City. The singing ceased as suddenly as it began, replaced by a vision of a beautiful brown-skinned lady standing amidst the rocks and shrubs. Summoning him tenderly, she identified herself as the Virgin Mary, Mother of God, and requested that he approach the bishop so that he might build a chapel at that site to signify her love for Mexico's indigenous people. After several meetings with Fray Juan de Zumárraga, the first

bishop of Mexico City, and subsequent meetings with the Virgin, to whom Juan Diego reported his failure, the bishop asked him for a sign from the lady to prove that she was indeed the Mother of God.

On December 12 the Virgin asked Juan Diego to walk to the top of Tepeyacac hill and gather the roses he would find growing there, which she arranged in his cloak (*tilmatli*, now known as *tilma*) with her own hands. When Juan Diego unfolded his *tilma* before the bishop, the roses fell to the ground to reveal a miraculous imprint of the Virgin. Fray Zumárraga fell to his knees, realized his error in not believing the humble Nahuatl, and took the image to his private chapel until construction of the Virgin's chapel was completed on December 26, 1531.

The story of Guadalupe remains one of the most treasured accounts in Mexican popular culture from the colonial period, inspiring writers over the centuries to debate the case for it as truth or legend. Stafford Poole's *Our Lady of Guadalupe: The Origins and Sources of a Mexican National Symbol, 1531–1797* (1995) points out several internal inconsistencies within the Nahuatl document in de la Vega's *Huei tlamahuiçoltica*. For example, he notes that although the text refers to the Franciscan presence in Tlatelolco, sources indicate that these friars had not yet established missions there by 1531, but had, in fact, resided in Juan Diego's hometown of Cuauhtitlan as early as 1525. In addition, native commoners in 1531 did not usually take double Christian names. Most important is the name of the devotion itself, taken from the Spanish Virgin of Extremadura, but whose pronunciation would have been difficult for Nahuatl speakers, since there is no *d* or *g* in their language. Poole also challenges scholarship that accepts Tepeyacac hill as the site of pre-Conquest Nahuatl worship of the mother goddess, Tonantzin, pointing out that native sources never mention this. He notes that Fray Bernardino de Sahagún first made this identification and remains the principal source of this error perpetuated by subsequent chroniclers. All of these complications lead Poole to conclude that the chapel at Tepeyacac hill dedicated to the Virgin of Guadalupe predated the apparition account. Many historians agree with this conclusion, including Nahuatl scholars Lisa Sousa and James Lockhart, who together with Poole published a new English translation and transcription of the *Huei tlamahuiçoltica* in 1998. Nevertheless, considerable scholarship exists to support the historicity of Juan Diego and his sixteenth-century vision, especially in Mexico, beginning with priest and professor Luis Becerra Tanco's two books of 1666 and 1675 in defense of the tradition, and the polymath Carlos de Sigüenza y Góngora's devotion to Guadalupe later that century. By the late nineteenth century, when Joaquín García Icazbalceta concluded that the tradition was not historically credible, he was "savagely attacked" by a large body of apparitionists (Brading, 2001, p. 10). The Jesuit church historian Mariano Cuevas also defended the cult in the 1920s, as did priest and honorary basilica canon Lauro López Beltrán, with great passion,

from the 1940s to 1980s. The position adopted by the influential Angel María Garibay (a Nahuatl scholar and basilica canon) in the 1950s was ambiguously neutral on the issue of historicity, prompting criticism from Edmundo O'Gorman, who argued in the 1980s that Antonio Valeriano was the original author of the Nahuatl account (the official position today of the Mexican Catholic Church). Even so, O'Gorman did not believe that this supported the historicity of the apparition story. Since Poole published his 1995 book, there has been no shortage of Mexican scholars, José Luis Guerrero prominent among them, to respond to him and his colleagues.

Despite the persistent controversy over the historicity of the apparition, the Catholic Church approved the Guadalupe tradition in official declarations beginning in the eighteenth century. In 1723, Our Lady of Guadalupe was proclaimed the "Patroness of Mexico City" and in 1737 she was named the "Patroness of New Spain" from California to El Salvador. Pope Benedict XIV approved these declarations for universal devotion by proclaiming Guadalupe the "Patroness of Mexico" in 1754. Official recognition gained further momentum in the late twentieth century. Pope John Paul II beatified Juan Diego on May 6, 1990, at the Basilica of Our Lady of Guadalupe, declaring December 9 as his feast day. On July 31, 2002, he canonized Juan Diego before a crowd of millions at the Basilica, making him the first indigenous American saint of the Catholic Church.

Because the worlds of academic discourse and personal faith do not often intersect, the debate over Guadalupe will remain controversial both within its colonial context and in its modern form. Considered alternately as being of indigenous origin, an invention of the sixteenth-century Spanish clergy to argue for their successful evangelization efforts, a seventeenth-century development to promote unity among clergy born in the New World, or as an authentic apparition story, the Virgin of Guadalupe has become the national symbol of Mexico and an important aspect of Latin American life today. Despite the roles of the colonial Spanish clergy and of modern Mexican politics in the development and perpetuation of the Guadalupe cult, the Virgin also represents the importance of the native influence on the evolution of Mesoamerican Catholicism. Christianity was not just imposed on Mesoamerica; it was in numerous ways appropriated by indigenous peoples and made Mesoamerican—that is, made meaningful in local, native terms.

MATTHEW RESTALL (2005)

MESOAMERICAN RELIGIONS: CONTEMPORARY CULTURES

Since long before the arrival of the first Europeans to Mesoamerica, the area's indigenous inhabitants have understood their world and indeed the cosmos to be an inherently unstable place whose continuity has demanded periodic human intervention in the form of religious rituals. It is ironic that a tendency for the world to slip into chaos has provided a primary organizing force, one which links the Mesoamerican with his or her individual community, its leaders, and ultimately with the cosmos beyond. This ritually forged cultural nexus has been pivotal in the cultural survival that has characterized the post-Conquest history of many regional towns. A widespread belief that a given town's leaders are uniquely

capable of performing the rituals needed to maintain cosmic order has functioned in a centripetal manner to strengthen the community at its political center. This in turn might buttress the capacity of a town to negotiate with outside religious, political, and economic interests.

These dynamics help explain a common characteristic of post-Conquest Mesoamerican religion: its distinctly local orientation. In various places, such as Zinacantan, Mexico, and Momostenango, Guatemala, the town has been understood by its inhabitants to be the literal center of the cosmos. Whereas this sense of sacred center manifest on a local level has identifiably pre-Conquest origins, with the arrival of Europeans it came to include key elements of Catholicism, such as the saints, Jesus, and the Virgin Mary. In marked contrast to this syncretistic blending of indigenous and European religious expressions are other Mesoamerican locales that have been fully integrated into the European cultural sphere. The capacity of a given town or region to avoid this type of integration—and similarly to maintain its customary local orientation—has often been a function of geographic or economic isolation.

In the early twenty-first century the dynamics of globalization are fully engaged in undermining that isolation. Diverse global forces, such as the North American Free Trade Agreement (NAFTA), loss of land to agribusiness, massive internationally based missionization, and cable television mean that in the struggle between tradition and change, the defining currents are steeply slanted toward change. The capacity of local communities to maintain any sort of viable autonomy is being overwhelmed. As a result modern Mesoamerica has witnessed changes in the religious landscape not seen since the Conquest nearly five hundred years ago. As the traditional religious-based political hierarchies have lost their capacity to successfully negotiate with outside interests, the local citizenry has turned away from both those hierarchies and traditional religious beliefs as well. In some cases secular national political parties have replaced the customary indigenous hierarchies. In other cases new religious-based political movements have ascended to power. Notable in this regard has been the politics of Guatemalan Efraín Ríos Montt. Founding his politics on an overt platform of evangelical Protestantism, Ríos Montt reigned over an exceedingly violent military junta in the early 1980s. He remains perhaps the most influential politician in the country in the early twenty-first century.

Despite the success of recently introduced religions in contemporary Mesoamerica, especially Protestantism, aspects of the older religious forms are still evident. In fact the religious landscape of Mesoamerica is highly diverse. The range of religious identifications and behaviors exceeds just indigenous expressions with deep historical roots and recently introduced religions with unmistakable foreign characteristics but also includes such expressions as revitalization movements representing a backlash against outside intrusions.

CUSTOMARY RELIGIOUS EXPRESSIONS. Before the arrival of the first Europeans to Mesoamerica, the region's indigenous inhabitants conceived of the cosmos as square. At its center was an axis mundi, typically in the form of a mountain, a tree, or a maize plant. There was a general consensus that the cosmos was layered and populated by multiple deities. Whereas the specifics of the configuration varied regionally, the subterranean realm(s) included an association with death and similarly with ancestors and the past. Although this realm seems to have evoked frightful emotions—to the K'iche' it was even called Fright Road—it was also understood by many of the region's inhabitants to be a source for the regeneration of the living present. Whether pertaining to humans, plants, or the vital life-nurturing rain, life was thought to come from death. Another widespread characteristic was a belief that religious ritual, typically performed by specialists, was needed to insure the recycling of death into life and ultimately back into death. These beliefs contributed to a ritual focus that was circular and repetitive in nature and all the while aimed backward to the ancestral past. This death to life cycle was sometimes expressed using vegetation metaphors, underscoring the centrality of agriculture in daily life.

In 1519 Hernán Cortés and the first large contingent of Spaniards arrived in Mesoamerica. While primarily motivated by the desire for wealth, these conquistadores also sought to convert the region's indigenous population to Catholicism. Although within a few decades newly built churches—often constructed on the sites of pre-Conquest temples—were to be encountered in all but the most isolated areas of Mesoamerica, the Europeans soon discovered that the “spiritual conquest” of the region was far more difficult than its military subjugation. A general dearth of Spaniards and a preference for the company of their own countrymen, compounded by their attraction to areas rich in readily exploitable economic resources, insured a high degree of indigenous self-administration, particularly in peripheral rural areas. In his book *Catholic Colonialism*, Adriaan van Oss observes that “by approaching the conversion of Indian communities through their traditional leaders, missionaries insured that the persons who played an active role in the establishment of the new cult, for example as sacristans, acolytes, catechists, etc., would in many cases be exactly the same individuals who before the conversion had occupied comparable positions in the spiritual life of the community, with obvious implications for the kind of Christian observance which took root” (van Oss, 1986, p. 21). The effects of that situation are evident in the religious lives of many Mesoamericans even in the twenty-first century.

COSTUMBRE. Central to the “Christianity” that took root in post-Conquest Mesoamerica is a shadowy construct known simply as *costumbre*. *Costumbre*, which can be defined as “old inherited ways of knowing and doing,” is often employed in verb form, as in to “do *costumbre*.” For most of the past five hundred years life in many Mesoamerica communities has been molded by it. To be a member of the community was to be a *Costumbrista*, a practitioner of *costumbre*. *Costumbre*

can be performed in myriad forms, from praying to the gods to planting maize. This vastly important component of post-Conquest culture tends to be shrouded in secrecy. In *Corn Is Our Blood* the anthropologist Alan Sandstrom observes that the Nahua of Amatlán, Mexico, passively avoid revealing anything about *costumbre* to outsiders by simply never revealing where or when a ritual is held. He writes that “so effective is their method of concealment that I had spent almost five months in Amatlán before I was aware that there was any ritual activity in the village. I was beginning to wonder whether perhaps I had discovered the first human group without rituals or religion” (Sandstrom, 1991, p. 231). The stealth aspect of *costumbre* hints of a certain anti-Spanish underpinning to the construct.

THE FIESTA SYSTEM. A primary venue for the performance of *costumbre*, and certainly a key element in the understanding of the evolution of post-Conquest indigenous society, has been the fiesta system. Various referred to in the literature as the “cargo system,” “*cofradía* system,” and “*mayordomía* system,” the fiesta system is the institutionalized celebration of regularly occurring fiestas. Whereas there is strong evidence for pre-Hispanic antecedents, in its strict sense the fiesta system is Catholic. Most of the fiestas are celebrated in accordance with Catholic saints’ days. In its modern form the fiesta system typically includes some form of “cargoes,” non-paying periodically rotated positions. This usage of the term *cargo* comes from Spanish and means position, duty, and responsibility. Attached to the cargo positions is a characteristic hierarchical structure. At some point the religious hierarchies in many Mesoamerican communities assumed political leadership duties as well. The resulting “civil-religious hierarchies” eventually shaped the subsequent cultural development of the communities over which they presided. The cultural forms, which emerged often, resembled pre-Hispanic forms, hence undermining the desires of the church and state alike.

One defining aspect of the emergent culture that echoes the pre-Hispanic era is the fiesta system’s ritual focus on the ancestral past. In many locales, such as Tlayacapan, a town in Morelos, Mexico, the connection with the past is vestigial and faint. The focus on the ancestral past is more evident in the Day of the Dead ceremonies celebrated in many Mesoamerican communities, though in some regions, such as in the Purepecha area of Michoacán, Mexico, it is performed in a heavily Catholic infused milieu. In other cases the pre-Hispanic connection is far stronger. For instance, in the Tz’utujil town of Santiago Atitlán, Guatemala, the fiesta system (*cofradía* system) is directly associated with the ancestral World Tree, the axis mundi thought to exist at the center of a four-cornered world. For *Costumbristas* in that town, the ancestors are said to lie at the root of the Tree, and the people of the town are its leaves and flowers. The leader of the system is believed to be the trunk (he is literally called Trunk), and his ritual input is thought to be vital for the world’s orderly functioning.

Although this type of belief can be traced to the pre-Conquest past, it would be incorrect to conclude that it represents some pristine form of ancient culture. Instead, even when having significant links to the past, the indigenous cultural expressions of post-Conquest Mesoamerica have been “reconstituted” in entirely new ethnic and class contexts. Clearly when the Spanish arrived and began their attempts to subdue and to control the indigenous inhabitants—to conquer them—that population’s embrace of the ancestral past took on significant new political implications. While in the words of one scholar the foreigners sought to “put an end to everything indigenous, especially in the realm of ideas, even so far as to leave no sign of them,” many Mesoamericans simply refused to cooperate (K. Garibay in Anderson, 1960, p. 33). By aiding and abetting the refusal of their own spiritual conquest, the embrace of the ancestral past assumed subversive ethnic dimensions that had not previously existed.

COFRADÍA BARTER AND BARRIER. The Catholic fiesta system was introduced into Mesoamerica within a decade of the Conquest with the importation of the first *cofradías*. *Cofradías* had long existed in Spain and Portugal as voluntary lay organizations whose primary purposes were the veneration of a particular saint and providing funerals and taking care of members’ widows. The initial Mesoamerican *cofradía* prototype matched closely its European counterpart, including the provision of social services. However, the Spaniards’ reasons for the institution’s introduction had little to do with such altruism. Rather, it was intended that *cofradías* (1) provide for the collection of revenues and (2) further the indigenous population’s integration into the church. Catholic priests, who were often poor, itinerant, and living in distant towns, came to be reliant on the funds paid by *cofradías* for the saying of mass on saints’ days. Because they had neither direct control over the *cofradía* funds nor over the amount of the stipend, it is of little surprise that they were forced to concede to certain indigenous demands. Bluntly, in various parts of Mesoamerica the local population utilized *cofradía* revenues to buy off otherwise intrusive outsiders, particularly priests, and in that way to subsidize a degree of cultural autonomy. Although outsiders did manage to successfully exploit *cofradías* for personal economic gain, that success came at a significant cultural and theological price.

This “barter” aspect has allowed many communities to subvert the second Spanish motivation for the introduction of *cofradías*: the facilitation of the local population’s integration into the church. Evading the scrutiny of their pious overlords living in distant towns, many communities have used the *cofradía* system to transfer aspects of pre-Conquest religious ritual, refabricating the institution in the process. Given that the *cofradía* system was ostensibly Catholic, as long as what the church looked upon as patently “idolatrous gear” was kept from sight, the system was on the whole at least minimally acceptable. (This is certainly not to say that “idolatry” disappeared. To the contrary: in some locales it has flourished, and in important ways the *cofradía* system has provided the platform for that survival.) Whereas enough of

the accoutrements of Catholicism are generally present in the *cofradías* to deflect direct intervention, at the same time the system can constitute a “barrier,” the occult side of which offers a venue for the celebrations of characteristically indigenous religious expressions.

THE SAINTS. A particularly salient component of post-Conquest Mesoamerican religious expression is the cult of the Catholic saints. Whereas the role of the saints in the religious life of the region’s inhabitants has changed considerably over time, in many cases they continue to resonate with what Nancy Farriss in *Maya Society under Colonial Rule* identifies as the “chameleon nature” of the pre-Hispanic gods. Writing about the Yucatecan Maya, she observes that the saints lining the walls and altars of the *cofradías* and parishes in many cases merely came to represent aspects of far more inclusive local deities. According to Farriss, “the addition of one more guise to the multiple permutations each deity already possessed would hardly have fazed the Maya theologians” (Farriss, 1984, p. 313). In some cases in the early twenty-first century the relation of pre-Hispanic deities with Catholic saints is only vaguely discernible. For instance, in Tlayacapan, Mexico, there is a faint relation of the central Mexican rain deity Tlaloc with John the Baptist. In other cases the conflation of ancient gods with Catholic saints is evident. In Santiago Atitlán, Saint Peter (called don Pedro) has a strong association with the ancient Mayan god Mam. In the town the “saint” is typically called Mam. Moreover both Mam and Saint Peter have associations with the *uayeb*, the five “delicate” days of the Mayan solar calendar.

Evident in these examples is the difference of interpretation in the significance of the saints encountered from community to community. This variation is further underscored in local understandings of the saints’ origins. In many communities the saints are believed to have come from foreign lands, though they may now be thought to inhabit nearby mountains. Other accounts of the origins of the saints may be more ambivalent, with some interpretations citing a local indigenous pedigree and others (at times coming from the same informant) describing a foreign origin. The regional variation in the significance of the saints is also evident in the specific roles and importance attached to them. For instance, in one town (Santiago Atitlán) Saint John might be associated with wild animals, whereas in another town (Amatlán) he might be linked to water.

Mesoamerican saints commonly behave in humanlike fashion, which is to say that they do not always display “saintly” behavior. Karl Wipf observes that the saints “may lie, lose their composure, take revenge, have love affairs, and so on” (Wipf, 1987, p. 430).

JUDAS. A tendency for Mesoamericans to interpret the “saints” in ways that differ from orthodox Catholicism is evident in understandings of Judas, again underscoring the church’s limited success in regulating the ideological and social contexts of Mesoamerican religious expression. Although in many communities Judas is reviled—just as he is in most

of Christianity—in other communities he is venerated as a saint. These wide differences in interpretation notwithstanding, in various instances interpretations of Judas find common ground in their reflections of indigenous Mesoamericans’ conflicts with the competing dominant national ethnic sector. In a classic study of Mayan passion plays, June Nash writes that in the Chiapas town of Amatenango del Valle, Judas is associated with the devil and the leader of the Jews. She adds that this disdained entity also prevents corn—the indigenous staff of life—from growing. Particularly significant is that in Amatenango “the Indians, with all the subtlety and intensity of the dominated, have transmogrified the despised villain of the anti-Semitic Christian passion into an icon of their own oppressor, the Christian Ladino” (Nash, 1968, p. 323). The fact is that in Amatenango Judas is unequivocally equated with Ladinos (non-Indians).

Starkly contrasting with Amatenango, in Santiago Atitlán, Guatemala, the local Judas figure is revered. Exemplifying the diversity of Mesoamerican Judas figures, in Atitlán Judas does not represent Ladinos but instead is said to have been created by local rain gods (*nawals*) and is typically considered to be Mayan. Moreover the deity embodies various definitively ancient Mayan aspects, including calendric associations. Connections with the ancient Mayas notwithstanding, the deity clearly embodies an anti-Catholic dimension. By elevating the enemy of orthodox Catholicism to a deified status, the local Mayas reaffirm their separation from the dominant ethnic sector. These ethnic underpinnings of the Judas figure indicate that the local adoption and subsequent reworking of foreign cultural elements has been integral in mediating the external hegemonic threat, of which the adopted elements originally were a part.

MAXIMÓN. Judas veneration in Guatemala is generally linked to the worship of a rum-chugging, cigar-puffing deity commonly called Maximón. In fact Judas is but one facet of Maximón, a complex deity who is worshipped in various cult centers around the country. The most important centers are located in Zunil, San Andrés Itzapa, and Santiago Atitlán. The god is addressed by a multitude of names, including San Judas, San Simón, don Pedro, Lord Skunk, and Lord Tobacco. Unlike virtually all other aspects of traditional indigenous religion in Guatemala, the Maximón cult may actually be growing. There is no central organization to the cult, explaining in part why the appearance and significance of the deity varies from town to town.

In customary usage the name Maximón is specific to the cult as it exists in the Tz’utujil town Santiago Atitlán. Only in the late twentieth century was the name adopted elsewhere. (Previously the other shrines generally employed the name San Simón.) Indicative of the deity’s complexity, the name Maximón has multiple meanings. It is a conflation of Mam, an ancient Mayan god and one of Maximón’s primary names, with the biblical Simon. Additionally in Tz’utujil the name means Mr. Knotted, this in reference to the deity’s manner of construction. While the exact nature of Maxi-

món's construction is a secret, it is widely known that the figure is made of tied tz'ajtel wood sticks. Its mask is carved from the same wood, accounting for another of its names, Lord Tz'ajtel. The god, who stands about four feet tall, wears two Stetson hats, one atop the other, and is draped in scarves, hence the name Lord Scarves. Varying from the other centers, where the deity is depicted as a seated Ladino (non-Mayan) wearing European-style clothing and dark glasses, in Atitlán it stands, wears the local style of handwoven dress, is Mayan, and never wears dark glasses.

Devotees in Atitlán recognize Maximón as the Lord of Looking Good. This is related to the deity's fancy garb but also pertains to sexual aspects. According to some scholars, this dimension may have its roots in an antecedent deity: the cigar smoking, lecherous ancient Mayan god L. Sexuality certainly underscores Maximón's creation. According to myth, Maximón was created in the primordial past by rain deities—*nawals*—to watch over their unfaithful wives. Contrary to plan, Maximón displayed unbridled hypersexuality, forcing the *nawals* to break the deity's neck to curb its behavior and power. Maximón nonetheless retained a capacity to transform into unworldly beautiful women or men. However, should one succumb to Maximón's sexual temptations, the price is insanity and death.

The ambivalent gender of Maximón reflects one of the god's more esoteric dimensions. Mayan cosmology has long emphasized binary opposition, including the world's never-ending transformations of male into female aspects, of dry into wet, and of life into death. As Lord of the Center, Maximón occupies the space between opposites and is the power that attracts one to the other. This underscores Maximón's Judas aspect, which devotees understand to be requisite to Christ's resurrection, hence the world's transformation of death into life and similarly of the dry into the rainy season.

SUN, MOON, AND EARTH. Whereas Maximón is recognized and worshipped in numerous Guatemalan towns, other deities of unquestioned pre-Hispanic origin have even wider representation in Mesoamerica. Central among those deities are the sun, the moon, and the earth. Like the Maximón cult, specific interpretations of these deities tend to vary from region to region. In fact in the primary Maximón cult center, Santiago Atitlán, Maximón includes the sun among his attributes. In that town the annual solar cycle is equated with waxing and waning of sexual "heat" and the evolution of Maximón (Mam) from his young to old forms. Local residents often refer to the sun as father. The sun is also called father by the Nahuas of Amatlán, Mexico, where it is considered to be the most powerful of the spirits. In marked contrast to Santiago Atitlán, where the sun is associated with Maximón-Judas, in Amatlán it is associated with Jesus. A pairing of Jesus and the sun is also found in the Tzotzil town of Chamula and elsewhere.

In numerous Mesoamerican towns the moon is equated with Mary. This association is found in communities that are generally thought of as traditional, such as Chamula, and

also in those that are highly acculturated, such as Tlayacapan. No doubt one reason for the salience of this association is that in Catholic iconography the Virgin of Guadalupe is generally depicted standing on a crescent moon. Not all towns that recognize a moon goddess pair her with Mary. In Santiago Atitlán, the moon, who is revered as "Grandmother," is not linked with Mary. In that town, the moon goddess' association with childbirth and weaving points to an origin in the ancient Mayan deity Ix Chel, who was also a moon goddess and associated with birth and weaving. For the Nahuas of Amatlán, the moon is related to the revered goddess Tonantsij, Our Honored Mother, but is also associated with the feared Tlahuelilo, "Wrathful One." This ambivalent understanding reflects both the moon's relationship to birth and fertility but also to the feared underworld and hence death.

This ambivalence about fertility and life on the one hand and death on the other stems from a Mesoamerican understanding of the earth in general. Writing about Amatlán, Sandstrom notes that "people are considered to sprout from the earth like the corn plant, and they are placed back in the earth when they die. The earth is the womb and tomb, the provider of nourishment and all wealth, home to the ancestors, and the daily sustainer of human life" (Sandstrom, 1991, p. 241). The idea of the earth as "womb and tomb" is also widespread in highland Guatemala, as is the association of the human body with corn. So important is the earth in this regard that it is deified. In several Mayan languages the word for earth is *ruchiliew*, "face of the land," which to Costumbristas refers to an understanding that the surface of the earth is the literal face of the deity. The Mixe of Oaxaca believe that the earth deity is female and call her Na-swi-ñ, or "earth surface." In some parts of Mesoamerica the earth deity is called simply Dios Mundo, World God.

LOCAL GODS. The local orientation of traditional Mesoamerican culture and religion translates into a certain local orientation for all the gods, even those such as the sun and moon that have wide regional recognition. This orientation is even more pronounced in a diverse set of gods explicit to individual Mesoamerican towns and subregions. For instance, many Mesoamericans believe deities inhabit local mountains. In Zinacantan these important deities are called Father-Mothers and are linked with ancestors. For the Tz'utujil of Santiago Atitlán, the primary surrounding mountains are thought to be the abodes of rain deities identified by a variety of names, including *nawales* and *achijab* (warriors). In Atitlán these deities, who are often conflated with the New Testament apostles, are believed to have wives, variously called the Marias and *ixok ajauwa* (lady lords). Several of the Marias are believed to be deified parts of the backstrap loom. Mountain gods and goddesses in the Q'eqchi' region of Guatemala are generically called *tzuultaq'a*, from the word *tzuul* (mountain) and *taq'a* (valley). The *tzuultaq'a*, who may be equated with saints and are thought to have a human form, live deep inside the mountain in a "house" (a cave). At the same time, a given mountain is thought to be the physical body of the god. Citing a Q'eqchi' informant,

Richard Wilson writes that “a *tzuul*taq’*a* feels pain when we clear the brush with machetes and jab the planting sticks into the earth” (Wilson, 1995, p. 54). Wilson adds that a given mountain is believed to have a face, a head, a body, and a cave that is either its mouth or womb. In various Mesoamerican towns the local mountain gods are said to be the “owners” of a particular mountain or volcano.

“SHAMANISM.” Numerous published studies of contemporary Mesoamerican towns cite the presence of “shamans,” sometimes including the indigenous term for the specific type of practitioner and sometimes not. A careful reading of this literature shows that the activities of the different practitioners vary significantly. This wide range of practices is at the basis of fierce scholarly debate about the use of the term *shaman* for ritual practitioners in Mesoamerica and elsewhere. One camp in this debate argues vehemently that shamanism is a viable concept that refers to an identifiable human activity. Others counter that it is really just a “made-up, modern, Western category.” Critics contend that the literature stereotypes a vast array of religious specialists and behaviors from widely differing cultural, historical, and class backgrounds when it presents those specialists under the tidy rubric “shaman.”

Whereas it may be useful and accurate to have a single term shaman, there is no doubt that in reference to Mesoamerica the category combines a wide range of differing ritual specialists. Among the different types of Mesoamerican specialists often labeled as shamans are herbalists, indigenous calendar specialists, bonesetters, midwives, snake and spider bite healers, and spirit mediums. Further underscoring these differences is that shamans in communities such as Amatlán and Momostenango are generally respected, whereas in other communities, such as Santiago Atitlán and San Antonio Ilotenango, they are not. A primary reason for the negative association, where it exists, is suspicion of witchcraft.

SYNCRETISM AND TRANSCULTURATION. Over most of the past five centuries a defining characteristic of Mesoamerica has been what one scholar describes as “radically asymmetrical relations of power” (Pratt, 1992, p. 7). Since the Conquest the region’s indigenous inhabitants have been subordinate to Spaniards and later to Ladinos. In this environment temples were sacked and churches built in their places. The indigenous inhabitants had to watch as the Spaniards brought in the cult of the saints and *cofradías*, as they introduced new artistic styles, even new forms of clothing. Over time few aspects of indigenous cultural expression were left untouched by European contact. In the wake of this contact many indigenous societies were completely integrated into the European cultural sphere.

Yet a survey of Mesoamerican religious practices and behaviors demonstrates that the region’s inhabitants have not been passive witnesses to their own history. Reflecting cultural resilience and transformative capacity, in many generally rural areas significant cultural aspects could be traced to the pre-European past. Evident in the Mesoamerican cult of

the saints—or the fiesta system—is that defining aspects of the post-Conquest cultures commonly have a European outer form but retain an identifiably indigenous meaning. In fact the Mesoamerican cultural landscape presents a textbook example of syncretism, the blending of two formerly discrete cultural traditions leading to the formation of new one. A simple observation of syncretism, however, leaves an important question unanswered. To what extent did Mesoamericans purposefully hold on to their pre-European traditions and in that way attempt to subvert the agendas of their would-be overlords?

Syncretism can be the natural outcome of subconscious thought processes and need not indicate purposeful intent. All people tend to interpret novelty according to preexisting understandings. In that light it is not surprising that Mesoamericans understandings of the saints, for instance, came to closely resemble those of their traditional gods. Whereas this sort of subconscious dynamic helps to explain Mesoamerican religious beliefs, it cannot account fully for the situation in towns where purposeful attempts to retain pre-European beliefs have occurred. In places like Amatlan, Momostenango, and Santiago Atitlán, traditionalists are aware that their *costumbres* differ from church teachings. An element of antichurch sentiment may also be apparent, as is evident in the Maximón cult or in the phenomenon of *cofradía* barter. These types of situations are explained by transculturation, the process in which marginal groups select and invent from materials transmitted to them by a dominant or metropolitan culture. In *Imperial Eyes*, a book about transculturation, Mary Louise Pratt points out that “while subjugated peoples cannot readily control what emanates from the dominant culture, they do determine to varying extents what they absorb into their own and what they use it for” (Pratt, 1992, p. 6). Mesoamericans may have had to watch as the Spaniards brought in the saints. Yet far from converting the Mesoamericans to Catholicism, Mesoamericans converted the saints to their own identifiably Native American religion.

EMERGING RELIGIOUS EXPRESSIONS. On March 15, 1873, Guatemalan president Justo Rufino Barrios signed the Freedom of Worship Act, eliminating Catholicism as the state religion and opening the country to Protestant missionization. A few years later the president went to New York, where he successfully petitioned the Board of Foreign Missions of the Presbyterian Church to commence a presence in Guatemala. Barrios’s petition had little to do with his personal religious conviction. Instead, Barrios, a Catholic, sought to attract foreign entrepreneurs otherwise ill-disposed toward Catholic countries. Although the early decades of the twentieth century did see a significant increase in the number of foreign entrepreneurs, it is not possible to determine how much of that was due to Barrios’s strategy on religion. What is clear is that the strategy had little impact on conversion to Protestantism. Fully a half century later, in 1940, less than 2 percent of Guatemalans identified themselves as Protestant. Guatemala remained solidly Catholic, though often

with a substantial infusion of the *costumbres*. That situation has now changed.

PROTESTANTISM. Contemporary Mesoamerica is experiencing a surge in Protestant growth. In Mesoamerica, as elsewhere in Latin America, the category Protestant, *evangélico* in Spanish, lumps a diverse group of religious identities, including Mormon, Jehovah's Witness, Pentecostal, and mainline denominations (predominantly Baptist, Presbyterian, and Lutheran). Since the 1970s Guatemala has witnessed particularly impressive Protestant growth, mostly among Pentecostal denominations. As many as one in three Guatemalans now identify themselves as Protestant. In fact three of the past seven heads of state have been Protestant. While the number is far lower in neighboring Mexico—around 5 percent of the country's roughly 100 million people—that country is now also witnessing significant Protestant growth, especially among the indigenous population. This growth is in part explained by conversions from Catholicism. Yet a Catholic migration explanation may be oversimplified, particularly when Costumbristas are lumped with orthodox Catholics. A different picture emerges when these groups with scant mutual resemblance are treated separately. In Santiago Atitlán, the town for which the best data are available, growth in orthodox Catholicism has actually outpaced the otherwise impressive Protestant growth. In both cases the growth has come at the expense of the Costumbristas, whose numbers declined precipitously in the late twentieth century.

There are multiple reasons for the surge in new religious identities and similarly for the abandonment of the *costumbres*. Where Protestant converts typically point to the Holy Spirit as the cause, scholars tend to look to an interplay of local, national, and international socioeconomic variables. The complexity of the situation, even on just the local level, is evident in consideration of population dynamics. Studies in Guatemala indicate that explosive local population growth has contributed to land scarcity, with catastrophic implications for religious systems founded on agriculture. In contrast, an analysis of the abandonment of the *costumbres* in the area in and around Tenango de Doria in Hidalgo, Mexico, by anthropologist James Dow, shows that an actual decline in the number of males, and hence of potential candidates to assume positions in the cargo system, has been a factor. In her book *Protestantism in Guatemala*, Virginia Garrard-Burnett observes that new religious identities held little appeal as long as the so-called "traditional community" remained in tact. "But when the center began to give, through the erosive processes of 'development,' migration, and war, many beliefs, practices, and institutions that shaped identity gave way with it. It is, at least in part, the attempt to re-create some sense of order, identity, and belonging that has caused so many to turn to Protestantism in recent years" (Garrard-Burnett, 1998, p. xiii). Other factors, which may add to the local appeal of Protestantism, can be its opposition to the sometimes excessive alcohol consumption associated with the *costumbres*. Additionally the relative quickness and efficiency of the Protestant seminary track has allowed a wide-

spread network of local churches staffed by local ministers. This is in contrast to a severe shortage of Catholic priests.

ECONOMIC UNDERPINNINGS OF CONVERSION. Various Mesoamerican scholars have written about a correlation between social and economic marginalization and religious conversion. Sandstrom's observation in Amatlán is typical in this regard. Sandstrom notes that early converts were from the most impoverished households in the village and included three alcoholics, one suspected thief, and another who was a "deadbeat" that refused to pay his debts. All were villagers who had lost hope that they could succeed in the prevailing socioeconomic environment. Similar dynamics are also evident in the Kaqchikel town San Antonio Aguascalientes, Guatemala. Sheldon Annis writes in *God and Production in a Guatemalan Town* that "to those who are economically marginalized by an abject poverty or socially marginalized by increased entrepreneurial activity, Protestantism says: Come to me" (Annis, 1987, p. 141). The attraction of Protestantism to the poor may be enhanced by "prosperity gospel," a message conveyed by some missionaries that conversion will bring concrete material gain. Sandstrom writes about statements by missionaries in Amatlán that local residents are poor because the *costumbre* religion is of the devil and conversely that all people of the United States are Protestants and "it is because of their religion that God has rewarded them with such great wealth" (Sandstrom, 1991, p. 352).

Whereas it might seem logical to simply dismiss any economic validity to prosperity gospel, there is evidence of a relation between Protestant conversion and economic advantage. Arguments for such advantage—what mission theorists sometimes call "redemption and lift"—usually point out that the cargoes attached to the traditional fiesta system are expensive and entail a trade of significant personal wealth for political power and prestige. Although this sort of economic redistribution and leveling may be socially stabilizing in a functioning subsistence-based agricultural society, it is anathema to entrepreneurship and the market economy. In his study on San Antonio Aguascalientes, Annis argues that ecological crisis, made worse by inequitable distribution of land, has pushed local residents toward Protestantism and its largely pro-entrepreneurial ethic. He observes that Protestants dominate a successful capitalist stratum in the town.

CONVERSION AS SOCIAL BACKLASH. One key factor benefiting Protestant entrepreneurs in San Antonio Aguascalientes has been convenient access to markets in the bustling nearby city Antigua. Much of rural Mesoamerica does not have that sort of economic advantage. One town that does not is San Antonio Ilotenango, Guatemala, as described by Ricardo Falla in his book *Quiché Rebelde*. Although Falla, who is both a Jesuit priest and an anthropologist, notes that some early converts in the 1970s did experience upward economic mobility, he points out that not all did. Hence Falla's study underscores both the possibilities and the limitations of religious conversion in effecting economic change. His study is also notable because the converts he describes are primarily

orthodox Catholics. Large-scale religious conversions often represent a backlash against existing power structures. In San Antonio Ilotenango, as in much of Mesoamerica, that power structure has not been orthodox Catholic so much as the *costumbre*-based indigenous religion and its civil-religious hierarchies. It should be recalled that in Mesoamerica the customary religion has often included a steadfast embrace of the ancestral past. That embrace elevated traditionality—and thus an emphasis on nonchange—to the level of religious dogma. Yet the undermining of traditional cultural forms, including subsistence based agricultural economies, now demands change. In what one scholar has called a “revolt against the dead,” as the traditional forms have eroded, many Mesoamericans have converted to new religious beliefs and identities (Brintnall, 1979).

EMERGENT CATHOLIC IDENTITIES. As the word *catholic* implies, the Catholic Church has always included a wide range of religious behaviors and identities. In the aftermath of the reign of the *costumbres* in rural Mesoamerica, several primary identities have emerged as dominant. One particularly salient expression, charismatic renewal, is the subject of considerable ambiguity in Catholic ranks. Mesoamerican *carismáticos* de-emphasize the saints and sometimes the central role of the Virgin Mary as well. Similarly they de-emphasize priestly liturgical participation, at times even refusing to conduct their religious services in the church building. Like their charismatic counterparts in other regions and countries, Mesoamerican *carismáticos* emphasize the role of the Holy Spirit and the reception of divine gifts, charisma. Given the similarities to Protestantism, particularly Pentecostal, some critics suggest that charismatic renewal represents a “Trojan horse” to the church, that it is a grave danger to legitimate Catholic belief and ritual. Others contend that *carismáticos* are really just Protestants-in-becoming. Whereas it is certain that some *carismáticos* may gravitate to Protestant Churches, for those that do not it may provide a bulwark to Protestant expansion. Charismatic worship may also help to “recapture” former Catholics.

An emphasis on the reception of divine gifts helps to explain charismatic renewal’s near total disregard of social and political issues. That disregard contrasts with another emergent Catholic group in Mesoamerica, Catholic Action. Although originally established by Pope Pius XI (r. 1922–1939) to be a nonpolitical lay organization, Catholic Action has generally worn the mantle of politics. This has been particularly evident in Guatemala, where, following on the heels of the organization’s role of attempting to stem the tide of communism and secularism in Franco’s Spain, it was employed in 1935. Largely confined to Guatemala City in its early years, the scope of the movement increased significantly in 1944, when a revolutionary regime with secular leftist tendencies assumed the Guatemalan presidency. Additionally that year the church took particular notice of its deteriorating state, as evidenced by the fact that a mere 120 priests attempted to serve the entire country. Under the direction of Bishop Rossel y Arellano, Catholic Action was introduced

throughout the countryside. Newly formed lay groups were instructed in Catholic orthodoxy and in the sins of nonsanctioned religious ritual. In this way the Guatemalan architects of Catholic Action intended that it serve both as a defense against Protestantism and communism and that it target the *cofradías* and shamans.

Although by the time of the introduction of Catholic Action into the countryside the efficacy of the traditional civil-religious hierarchies was already eroded, that introduction did cause considerable social turmoil and backlash in communities such as San Andrés Semetabaj and San Antonio Ilotenango. Perhaps most notable in that regard was Santiago Atitlán, where in 1950 leading members of Catholic Action were involved in the stealing of the head of Maximón and the temporary outlawing of the god’s cult. Ironically it was the intercession of town Protestants on the side of the Costumbristas and against the Catholics that restored the legal status of the cult. The occasional Costumbrista triumph such as this notwithstanding, Catholic Action has become a dominant social and religious force in rural Mesoamerica.

LIBERATION THEOLOGY. Augmenting the strategic introduction of Catholic Action in the fight against secularism, communism, and Protestantism, the Catholic Church began to aggressively place new priests in the indigenous countryside. Of particular note in Guatemala was the introduction in the late 1940s and 1950s of number of Maryknolls, based in the United States, and Belgian Sacred Heart brothers, who arrived a year after the church-supported overthrow of the leftist government in 1954. In Mexico the appointment in 1949 of Samuel Ruiz to be bishop of the heavily Mayan diocese of Chiapas proved significant. On his arrival to San Cristobal de las Casas, where the diocese is centered, Ruiz was shocked to find that the indigenous peoples were prohibited even from walking on the sidewalks. The Maryknolls and Sacred Heart brothers were equally shocked by the poverty and squalor in the indigenous communities to which they were sent and the inhumane treatment of the population by some in the dominant Ladino sector.

Because of the crisis state of the local economies in both Guatemala and Chiapas, including an increasingly critical shortage of available agricultural land, many residents were forced into seasonal plantation work. In that highly exploitative environment, people from all over intermingled and talked. Gradually they became aware of national social and political issues. Some even learned that the plantation land now owned by international agribusiness was former Indian land that had earlier been expropriated. Many of these migrant workers were catechists, members of Catholic Action. Garrard-Burnett notes that, in stark contrast to the local orientation of the Costumbrista civil-religious hierarchies, “catechists were outwardly focused leaders informed by contemporary ideas of development and, more recently, by concepts of social justice as defined by liberationist Catholicism as introduced by the foreign priests” (Garrard-Burnett, 1998, p. 129).

Beginning in the 1960s and gaining full momentum with the 1971 publication of *A Theology of Liberation* by the Peruvian Catholic priest Gustavo Gutierrez, many Latin American priests embraced liberation theology. In Mexico, Bishop Ruiz became probably the leading figure in the movement. At the forefront of that trend in Guatemala were the Maryknoll and Sacred Heart orders. Ironically, though it had originally been intended that those orders be a firewall against communism, liberation theology is founded on a Marxist substrate. In particular liberation theology fully embraced the notion of dependency theory and its argument that the economic development of the core developed countries entailed the subsequent underdevelopment of the Third World. The radical clergy aggressively sought to break the ties of that dependency. Finding a particularly receptive base within their newly activist parishioners, the liberationist priests embarked on program of *conscientización* (consciousness raising) and economic development. Central to the liberationist strategy was the establishment of base ecclesial communities (CEBs), which were groups of twenty to thirty lay members who regularly met with a nun or priest to discuss issues of philosophy and religion and to initiate strategies for liberation.

THE NEW JERUSALEM. On March 23, 1982, a military coup established General Efraín Ríos Montt as the head of state in a Guatemala embroiled in a lengthy civil war. That night on national television the born-again Protestant proclaimed, "I am trusting my Lord and King, that He shall guide me." A week later Ríos Montt appeared on *The 700 Club*, where the host Pat Robertson appealed to viewers to pray around the clock for the general and pledged \$1 billion for Guatemala's reconstruction. With Guatemala now firmly established in the holy war against godless communism, Ríos Montt oversaw what one scholar has called "total war at the grassroots" (Jonas, 1991, p. 148). In sanctioning this campaign the "born-again" general time and again noted Guatemala's central role in divine providence. "We are the chosen people of the New Testament," Ríos Montt said. "We are the new Israelites of Central America" (Annis, 1987, p. 4). Deflecting charges that his policies, which ultimately led to the total destruction of more than four hundred Maya communities, amounted to a "scorched earth" campaign, the dictator replied that it was in fact a "scorched communist" campaign.

The great majority of those "scorched" were Maya living in the countryside. Particularly hard-hit was the Department of El Quiché, the primary area served by the Maryknoll and the Sacred Heart orders. Suspected as being communist, the nuns and priests and their parishioners in the base ecclesial communities were common targets for state-sponsored violence, though many Protestant Maya were also killed or displaced. Garrard-Burnett notes that for Ríos Montt, "communism represented the ultimate rejection of morality and God-given authority; it had to be countermanded by his divinely sanctioned 'final battle against subversion,' which he conceptualized in nearly apocalyptic terms" (Garrard-Burnett, 1998, p. 145). The dictator talked of the "rotten-

ness of mankind," which he said had a name "communism, or the Antichrist, and all means must be used to exterminate it" (Garrard-Burnett, 1998, p. 148). Although Ríos Montt was only in power for seventeen months before being toppled in another military coup, the number of people killed during his regime far eclipsed any other head of state in Guatemala's thirty-year civil war.

THE ZAPATISTA UPRISING. On New Year's Day 1994 the world awoke to the surprising news of a massive revolt in Chiapas, Mexico. As stunning as the "Zapatista" uprising itself was its coincidence, to the day, with the implementation of the North American Free Trade Agreement (NAFTA). In hindsight the uprising perhaps should have come as no surprise. Amid incessant heralding of the widespread benefits that free trade must inevitably bring, even proponents of NAFTA confessed that its implementation would entail certain "adjustments" for some of those involved. Simply put, those that took to arms in the mountains and jungles of Chiapas believed that they themselves were in danger of being adjusted. Of particular concern was NAFTA's dismantling of Article 27 of the Mexican constitution. That article, which grew out of the *Tierra y Libertad* (Land and Liberty) rally cry of Emiliano Zapata's followers in the Mexican Civil War, is a constitutional guarantee of land for all Mexican citizens.

For some years prior to the uprising, displaced peasants from highland Chiapas and elsewhere in Mexico began forming communities in the sparsely populated jungle areas of eastern Chiapas. Included in the population were thousands of Protestant Tzotzil and Tzeltal Maya who had been expelled from their towns because of their religious beliefs. One town, Chamula, has expelled more than thirty-two thousand mostly Presbyterian evangelicals in the previous twenty years. The 1990 census showed that Protestants numbered between 20 and 51 percent of the population in the *municipios* (towns) of eastern Chiapas. Included in the population is a mix of Seventh-day Adventists, Presbyterians, Baptists, Pentecostals, Jehovah's Witnesses, and Mormons. In part to counter the growth of Protestantism, the Catholic Church ramped up its community building efforts in the region, concentrating much of their efforts in a group of settlements lying in the Lacandón rain forest near the border with Guatemala.

The anthropologist George Collier, perhaps the leading authority on the Zapatista rebellion, argues that the social mix of eastern Chiapas provided fertile ground for the rise of the EZLN, the Zapatista National Liberation Army. Because most of the residents were recent immigrants, there were few established power structures to limit the emergence of participatory democratic communities. Moreover the newly arrived religious groups established functioning networks for building those communities. Another key factor in the incipient peasant movement was the input of liberationist dialogue, mostly coming from Bishop Ruiz and his colleagues. Of particular significance was the church-sponsored 1974 Chiapas Indigenous Congress. Collier ob-

serves that the demands issued at the conference on issues of land, food, education, and health were almost identical (suspiciously so) to those the EZLN issued twenty years later.

The catechist delegates took the lessons of the Indigenous Congress with them when they returned to their communities in eastern Chiapas. Ultimately they were stymied in getting their message out by the region's religious pluralism. Collier observes that only truly secular movement appealing to pluralism and democracy could unite the peasant communities across the chasm of religious diversity. Ultimately the EZLN filled that role. Although the level of direct involvement of Bishop Ruiz and his catechist colleagues in the formation of the EZLN remains unclear, some level of involvement is certain. Critics have charged the bishop with being a primary architect of the movement. Others claim that his lessons were merely an inspiration. For its part the EZLN declares that "we have no links to Catholic religious authorities, nor with those of any other creed Among the ranks, the majority are Catholic, but there are also other creeds and religions" (Collier, 1999, p. 65).

Fully a decade after first seizing the world's attention, the EZLN steadfastly declares that "land is for the Indians and peasants who work it, not for the large landlords. We demand that the copious lands in the hands of ranchers, foreign and national landlords, and other non-peasants be turned over to our communities" (Collier, 1999, p. 64).

PAN-MAYANIST ACTIVISM. Activist demands for land and human rights in Mesoamerica are not limited to those emanating out of the Zapatista communities in eastern Chiapas. Of particular note in this regard is Pan-Mayanism, a coordinated activism bringing together Maya from far-flung locales. Whereas there are indications that this movement may be starting to take hold in Mexico, it is primarily associated with Guatemala. In fact in many ways it was the social turmoil created by the civil war and aggravated by such factors as globalization and ecological crisis that provided the impetus for Maya to unite in demands for the halt of racism, ethnocide, poverty, and violence. Joining in that demand has been a loosely knit group of foreign intellectuals and scholars who have provided organizational and technical support to the movement. A challenge for those involved has been to refocus Maya culture and ethnic identity from its customary local orientation to a national level of identity. Stated differently, the challenge has been to create a sense of Maya nationalism. It has been helpful that various key indigenous leaders of the movement have been educated in urban universities, where they could share perspectives and kindle their activism. The outgrowth of the Pan-Mayanism can be seen in dozens of indigenous organizations dedicated to the preservation of Maya languages, cultural research, publishing, and civil rights. The movement was also influential in the inclusion of a plank recognizing Maya culture and indigenous rights in the peace accord ending Guatemala's civil war.

This activist substrate to Pan-Mayanism is explained in part by its having built on the Catholic Action pattern of

leadership. Given the original anti-*costumbre* agenda of Catholic Action, it might seem curious that many Pan-Mayanists embrace a "decolonized" form of the *costumbres*. In a classic display of revitalization, they have attempted to remove all traces of Christianity. Yet revitalization movements never fully succeed in purifying themselves, and they typically include new beliefs and behaviors. This is evident in the use of laptop computers to calculate Maya calendar dates by the movement's "Maya priests" or in their embrace of New Age concepts. Ironically, in the attempt to recreate the original form of Mesoamerican religion, Pan-Mayanism may actually have created its newest form. In any case apparent is the agency, creativity, tragedy, and sense of hope that has always characterized religion in Mesoamerica.

MESOAMERICAN RELIGIONS: MYTHIC THEMES

Myths emphasize realities and events of the origins and foundations of the world, of humanity, of staple food, and of supernatural beings—of gods and cultural heroes.

In the case of Mesoamerican pre-Hispanic myths, the various primary written sources have often survived in fragmented form. As for present Mesoamerican peoples, most scholars count on ethnographic material collected by anthropologists in the twentieth century.

Mesoamerica shares a common cosmovision and therefore many similar myths with a diversity of cultures. The sources that describe the aboriginal cultures were written mostly in Spanish—and primarily about Central Mexico—in the sixteenth and seventeenth centuries; some were written in Nahuatl by the conquerors themselves, by friars who began to evangelize, or by converted indigenous peoples. Whereas a few complete texts remain—such as the creation of the sun and moon in Teotihuacan and the story of Quetzalcoatl—most of these texts contain only fragments of the myths. There is the long, well-structured Mayan cosmogonic myth of the *Popol Vuh*, written around 1551. This myth was written in Roman characters, in Quiché, with the intention to be read in their secret ceremonies (a tradition that is still alive among the present indigenous peoples).

The ethnographic data cover wider areas, but share some mythic themes with each other, as well as with pre-Hispanic myths. Much Christian syncretism also exists, because many saints and virgins become merged with old deities.

Many symbols of the pre-Hispanic myths that have not reached us are shown iconographically in the archaeological remains, like the cosmic tree, the earth monster, or the jaguar.

Mesoamerican thought is dominated by a concept of duality. The Nahua Supreme God is known as Ometeotl ("Lord Two") who represents a unity of contraries. He-she lives in Omeyocan ("Place Two"), which has been identified with Tamoanchan ("the house where they came down") and Xochitlicacan ("the place where the flowers raise") and is located above the thirteen heavens. When Ometeotl unfolds, he-she becomes Omecihuatl ("Lady Two") and Ometecuhtli ("Lord Two") who together create four gods—the creators of the rest of the gods and of the world: fire, the calendar, the lord of the land of the dead, a great sea, aquatic gods, the earth monster, and twelve more heavens. Omecihuatl and Ometecuhtli then made a man and a woman, the first sorcerers and the parents of humankind.

In the middle of Tamoanchan, the heavenly paradise, rises a marvelous flowering tree. According to one version of the myth, the beautiful goddess Xochiquetzal lived there in happiness and plenty, but she was seduced by Tezcatlipoca. In another version of the myth, the gods tear the branches off the tree, cutting off its flowers in the process. For this deed they are punished by the supreme gods Tonacatecuhli and Tonacacihuatl and thrown out to earth and to the underworld.

Alfredo López Austin (1994), has written about Tamoanchan and the actions that took place there, working from the fragments of myth and from Nahuatl poems. López Austin concludes that through the actions of the gods for which they were punished, they originated sex, created other space, other beings and other time. The gods had been contaminated with death, but they could now reproduce.

Michel Graulich writes that the main theme in the origins of Mesoamerican myths is the passage from one era to another, by the way of a rupture between the sky and the earth as a consequence of a transgression (1997). When the gods are banished from Tamoanchan, Tollan, Tlalocan, and Aztlan—places mentioned as paradises or ideal lands which represent the union of opposites—a state of unity and harmony is achieved where the primordial couple and their children lived in perfect tranquility. When the creators punish the gods, they are sent to darkness. However, they return to light following a sacrifice

COSMOGONIC MYTHS. The concept of cyclic time and the cosmogonic ages (or “suns”) is based on the idea that the gods created the universe to be inhabited by humans so that they would serve, worship, and feed the gods. This concept emerged through a cyclic process of creation and destruction through which the beings (humans) that the gods wanted to serve them evolved progressively.

In central highland Mexico there were held to have been four previous Suns or eras, each of which ended in a cataclysm, then a fifth which is the present world. The first age was called 4 Ocelotl (4 Jaguar) and Tezcatlipoca became its Sun. Giants lived during this time but were devoured by jaguars when the Sun ended. The second era was 4 Ehecatl (4 Wind), when Quetzalcoatl Ehecatl was the sun. This epoch was destroyed by great winds, the survivors turned into monkeys. The third creation was 4 Quiauitl (4 Rain), the Sun of the rain god Tlaloc. This world ended in a rain of fire and the few survivors became butterflies, birds and dogs. In the fourth age, 4 Atl (4 water), Chalchiuhtlicue, the water goddess, was the Sun. The world disappeared in a great deluge and any survivors became into fish. The force of the flood caused the sky to fall down, so Tezcatlipoca and Quetzalcoatl became into great trees and raised it back into place. The name of the Fifth Sun 4 Ollin (4 movement), refers to the movement of the solar phenomena; This era was presided by the earth god Tlaltecuhtli and was to be destroyed by an earthquake. (Heyden, 1987).

According to Mayan myth, in the first creation the gods made the animals but these animals did not praise the gods; they only cried, croaked, or screeched. The gods then made some men out of mud, but they were destroyed by water, so they in turn made man out of wood and woman out of reeds. These creations also could not serve the gods and were destroyed by the rebellion of their domestic animals, their household objects, and by a flood. The remaining humans became monkeys. At last the gods created four men who were so intelligent and with eyesight that was so perfect that they could see all that exists. The gods realized, however, that they had once again failed; if humans were perfect they would then equal the gods and would not propagate. So “Heart of Heaven” threw his breath on the eyes of these four men and blurred their sight, preventing them from seeing only that which was nearest to them. Thus, their wisdom was destroyed. This myth can still be found among the Lacandon.

In another Maya version, thirteen men and twelve women were created by Hurakan and the other gods by their mixing maize dough with the blood of a snake and a tapir.

Many modern Mayan groups still believe in the different cosmic ages, with the various beings inhabiting them. In the modern era, however, these beliefs have expanded to also include Adam, Eve, Jesus, and Mary. These groups have also lost the idea that humans were made to worship and sustain the gods.

THE DELUGE AND THE CREATION OF MEN. The last creation was destroyed by water. The version of the deluge and the creation of the new humanity is told in pre-Hispanic versions, but it is also widely known among many modern ethnic groups. In the pre-Hispanic version of the myth, Tezcatlipoca chose a couple, Tata and Nene, to be saved from the deluge. He asked them to make a canoe out of a hollow tree and save themselves. When the water receded they broiled a fish, but the smoke reached heaven and the gods became angry. So, Tezcatlipoca came down and converted Tata and Nene into dogs.

The more widely spread ethnographic version of this myth says that a man was saved from the deluge on the advice of a supernatural being. The man took with him on his boat maize and a bitch. When the waters receded, he went to the field to work. Every time he returned home he found that food had been prepared. One time the man hid and found that the bitch was in fact a woman who had taken off her bitch skin; it was she that was doing the cooking. The man burned the skin and took the woman as a wife, and from the descendants of that couple the earth was inhabited again.

In some pre-Hispanic myths humans are also created from the bones of people of other ages. This creation myth has been explained by López Austin (1994) as the generic creation of human beings against the differentiated birth of human groups from Chicomoctoc (Seven caves). When the

world had been restored, the gods got together and asked themselves: who is going to inhabit the world? They decided to send Quetzalcoatl to the underworld to get the bones to create the new humankind. (Another version of this myth claims that it was Xolotl who was sent to the underworld.) Quetzalcoatl went to the underworld and asked for the bones of the Lord of the dead. Quetzalcoatl was given the bones, but at the last minute the Lord changed his mind. After persisting, Quetzalcoatl at last retrieved the bones and brought them to Tamoanchan, where the goddess Cihuacoatl Quilaztli ground them and mixed the powder with the blood from Quetzalcoatl's penis. With this material the new humanity was created.

OTHER CREATIONS OF MAN. The first four gods created by the primeval couple made a man and a woman, Oxomoco and Cipactonal, who were ordered to till the soil and to spin and weave. Then they were given maize kernels for divination. Oxomoco's and Cipactonal's children formed early mankind. The *Historia de los Mexicanos por sus pinturas* (1964) relates that when the sky fell and Quetzalcoatl and Tezcatlipoca raised it again, they had to create four men to help.

In yet another myth, when the first four gods made a sun to light the world and this was fed hearts and blood to help it move, war was invented; humans were created in order to wage that war. In the Tlaxcala tradition, Camaxtli, the hunting and war god, hit a great rock with his staff and four hundred Chichimecs came out to settle the land. The Chichimec, who later changed their name to Otomí, regarded both Camaxtli and the rock as their mythical ancestors. According to accounts from Tetzco, related in *Historia de México* (1964), an arrow shot from the sky landed near Tetzco and formed a great hole in which appeared a man and a woman. But they were in the form of busts, with half bodies. This man and woman copulated with their tongues and had children who settled Tetzco. Another account states that Citlalicue ("skirt of stars," i.e., the Milky Way) sent sixteen hundred sons and daughters to Teotihuacán, but all perished there. According to Mendieta (1945), Citlalicue gave birth to a flint knife. This frightened her other children, and they threw the knife out of the sky and it landed in Chicomoztoc ("seven caves") near Acolman in the vicinity of Teotihuacan.

However, the sixteen hundred sons and daughters sent by Citlalicue (or who miraculously came from the flint knife) were more divine than human; they demanded that their mother provide people to serve them (Heyden, 1987).

SUN, MOON, AND STARS. The myth of the Fifth Sun (the present era) is one of the best known in Mesoamerica: when all was in darkness, the gods gathered at Teotihuacan (identified in historical tradition with the historical city of Teotihuacan) to create a new sun. Two gods offered to sacrifice themselves: the rich Tecuciztecatl, who performed penance with costly objects; and Nananhuatzin, who was poor and diseased and whose offerings were only reeds, grass balls, ma-

guy spines, and paper. After four nights of penance, both gods were led to a sacred fire. Tecuciztecatl was terrified by the strength of the fire and withdrew, whereupon Nananhuatzin threw himself into the flames, which purified him and turned him into the sun. Inspired by this metamorphosis Tecuciztecatl also leaped into the fire. But it had died down and no longer burned brightly, so he turned into a lesser light. He became the moon (Heyden, 1987). When the moon came out, one of the gods hit its face with a rabbit, the mark of which can still be seen. After this, the sun stopped in the sky and refused to move unless all of the gods were sacrificed. (A version of this myth was recorded in 1949 by R. Barlow in Tepoztlan, Morelos, and another version is still told among the Huichol people.)

The Maya version of the sun creation myth is included in the *Popol Vuh* and it relates the adventures of the twins called Hun Hunahpu ("1 hunter") and Vucub Hunahpu ("7 hunter"). One hunter had two sons who were both wise men, painters, and diviners. The twins were fond of playing ball and the noise they made bothered the Lords of Xibalba (the underworld). These lords incarnated different diseases. They called the twins to their realm and had them pass through a series of trials until they ended up sacrificed and buried. The head of Hun Hunahpu was placed in a gourd tree. Ixquic, the daughter of one of the Lords of Xibalba, approached the tree and the head of One hunter spat on her hand and made her pregnant. Ixquic was condemned to be sacrificed because of this, but escaped with the help of her would-be executioners, who were two owls. Ixquic went to the surface of the earth and gave birth to another pair of twins, Hunahpu ("Hunter") and Xbalanque ("Deer jaguar") who are taken care of by their grandmother. After some adventures—which include converting their half brothers into monkeys—they also start playing the ball game; again they are called to Xibalba, but this time they pass the trials, deceiving the lords of the underworld. At last, however, Hunter and Deer jaguar decide to burn themselves, thus becoming the sun and the moon.

The creation of Venus is also the result of the sacrifice of Quetzalcoatl, ruler of Tollan, who after having been deceived by his rival gods, Tezcatlipoca and Huitzilopochtli, leaves his city and goes to a land called Tlillan Tlapallan, the land of red and black. It is here that he burns himself and becomes the morning star.

SACRIFICE. Sacrifice as a means of creation, transformation, sustenance of the world is an important mythic theme, as has been seen in the cosmogonic myths in which not only the sun, moon, and Venus have to incinerate themselves to become stars, but so too do the rest of the gods have to sacrifice themselves so that the sun agrees to move on in the sky.

Sacrifice is also mentioned in the story of how the Sun made four hundred men, the Mimixcoa, wage war and give to him the blood and hearts of their captives to eat. The Mimixcoa, however, occupied their time hunting and having fun and failed to do their duty; therefore, the sun decided

to create four other men and a woman, ordering them to kill the first four hundred and to feed the sun and the earth. The division of the primeval androgynous monster to create heaven and earth is a form of sacrifice, as the earth would not give her fruits if she was not given to eat men's hearts and was not irrigated by their blood.

Sacrifice is also demanded by the Tlaloque—the gods of water—as a requirement for the ability to grow edible plants. In the last days of the Toltecs, there was a period of storms and destruction of crops; to stop this, the tloaque asked for the sacrifice of the Mexica Tozcacuex's daughter; he did this, and received as his prize good crops of maize.

THE ORIGIN OF MAIZE AND OTHER EDIBLE PLANTS. Because maize was the staple food of Mexico, much of the ritual life was guided towards its production. In pre-Hispanic as well as in modern times, plenty of myths relate to it; most of them are ethnographic.

According to the pre-Hispanic version, Quetzalcoatl saw a red ant carrying a maize kernel and asked the ant many times from where she had obtained it. Eventually the ant told him that she received it from the Tonacatepetl (“hill of our sustenance”). So, Quetzalcoatl transformed himself into a black ant and got the kernels, which he took to Tamoanchan; there the gods chewed them and put the kernels into the mouths of humans to make them strong. They then sent Nanahuatl to break Tonacatepetl, and the tloaque collected the maize of four colors and other edible seeds to make them available to humans.

In another version, maize and all edible plants came from the body of the god Cinteotl (“god of maize”) who “enters” the earth. In some ethnographic versions, one can still find the stories of the ants hiding the maize kernels.

Ethnographic versions of a maize child are very widely spread all over Mexico. His name may be Oxchuk, Dipak, Piltontli, or many others. This myth was discovered by George Foster (1945). In it, the child who has golden hair is found inside an egg by two old people. The child has marvelous powers, as well as good and bad relations with animals. After a while, the elderly couple tries to kill and eat him, but he discovers their intentions and kills them first. The child then has more adventures, in one of which he has an encounter with Hurakan, a god of the sea and/or of thunder, whom he defeats.

In the Totonac version (Ichon 1973), the father's child is killed because he likes to play the violin. Shortly after the child is born, he dies and is buried by the mother, and from his tomb a plant of maize grows. She cuts some kernels and throws some grains to the water; there, a turtle keeps one on her shell, and from that grain the maize child is born again. The child then has many adventures, including creating thunder and the clouds of rain.

Maguey was a very important plant in Central Mexico, from which, among other things, the intoxicating drink *octli* or *pulque* was (and is) made. The story says that Quetzalcoatl

went to heaven to look for a maiden goddess called Mayahuel. He found her among other maidens who were being taken care of by their grandmother, a *tzitzimitl* (a monster). Quetzalcoatl woke Mayahuel up; he told her that he was taking her to earth, which he did, transforming them both into a tree with two branches. One branch was Quetzalcoatl, the other Mayahuel. When the *tzitzimitl* discovered that Mayahuel was missing she went after her, found the tree, and broke Mayahuel's branch and, along with other *tzitzimitl*, ate her up. Quetzalcoatl gathered Mayahuel's bones and planted them, and from these bones the first *maguey* was born.

MYTHOLOGIZED CULTURAL HEROES. The hero acts as a point of intersection between different times that may be both mythic and historic; he gets close to beings who travel through the three cosmic levels: heaven, earth, and underworld, and are capable of supernatural feats. Many heroes must pass through initiation trials. They also have miraculous births. Heroes may act as tricksters, they are deified, and they are expected to return.

The first example of a hero is Quetzalcoatl, born miraculously—according to different versions—from Chimalma, who swallowed a green stone or was made pregnant by Mixcoatl. Quetzalcoatl's jealous uncles or brothers try to kill him, but they fail and instead kill his father. He takes revenge and kills the uncles or brothers, then begins searching for his father's bones. Quetzalcoatl becomes the wise ascetic king of the city of Tollan, which becomes very prosperous under him. He spends his time praying; he bans human sacrifice. However, Quetzalcoatl's eternal enemy, Tezcatlipoca—along with other gods—deceive him by making him drunk and then introducing into his chambers a woman: his sister or a prostitute.

When Quetzalcoatl recovers from his drunkenness he feels so ashamed that he decides to leave Tollan and goes to the west until he reaches the coast of the sea. In a land called Tlillan Tlapallan he burns himself, thus becoming the Morning Star. Before he becomes the star, however, he first promises that he will return. Quetzalcoatl is also said to have gone to the Maya area, where he is known and worshipped as Kukulcan.

Quetzalcoatl, along with Tezcatlipoca, is one of the gods in charge of creation. These two gods divided the primeval monster and created heaven and earth, keeping heaven and earth separate. Both gods had been suns in the past ages. Quetzalcoatl went to the Land of the Dead to get the bones to create man. He also brought maize from the Tonacatepetl and helped with the creation of *maguey*.

Much has been written about the mythic hero Quetzalcoatl, by Alfredo Lopez Austin, Blas Castellón, David Carrasco, and H. B. Nicholson. According to Nicholson, Topiltzin Quetzalcoatl “was conceivably a genuine historical figure prominently involved with an early stage of Toltec history. . . if so he later seems to have become blended and, occasionally, to some extent confused with certain supernat-

ural personalities, particularly an ancient fertility/rain/wind creator deity, Ehecatl Quetzalcoatl." After several other appreciations he concludes that "the evidence for a widespread belief in his eventual return to reclaim his power, which might have influenced Motecuhzoma II of Mexico Tenochtitlan—who apparently was considered to be the direct dynastic successor of Topiltzin Quetzalcoatl—during his initial dealings with Cortés, is quite strong" (1992, p. 291).

Huitzilopochtli, the patron god of the Mexica's story, is connected with the Mexica pilgrimage and with their success as conquerors of almost all of Mesoamerica. He seems to have been a shaman priest who was in communication with the god Tetzauhteotl, who may have been a form of Tezcatlipoca. Huitzilopochtli was the one who took the Mexica out from Aztlan and guided them during their pilgrimage. He dies on the way and on his bones incarnates the god Tetzauhteotl and then continues guiding them. According to the best known story, Huitzilopochtli is born from Coatlicue ("Skirt of snakes") who was made pregnant by a ball of feathers that fell from the sky while she was sweeping the temple and which she put under her dress. Her other children, the four hundred Huitznahua, led by the sister Coyolxauhqui, felt ashamed of their mother and tried to kill her. But Huitzilopochtli, born in full warrior's regalia, fights and defeats them. He cuts off Coyolxauhqui's head and dismembers her, then annihilates the rest of the brothers. Huitzilopochtli then leads the Mexica to their final destination, giving them orders and advice and setting the rules for the privileges given to warriors who distinguish themselves in battle by offering more prisoners for sacrifice.

Hunahpu and Xbalanque are examples of mythic heroes, as well. Among the ethnographic mythic heroes, one can also include the maize child, in addition to Kondoy, Fane Kantsini, and Tepozteco from the Mixe, Chontales from Oaxaca, and the Nahua from Morelos.

Kondoy and Fane Kantsini were born from an egg and raised by adoptive parents. Both developed rapidly and became great hunters, fighting against the Zapotecs. Both Kondoy and Fane Kantsini disappeared but promised to return to help their people.

The other cultural hero is Tepozteco, whose mother became pregnant by a bird that flew around her for a time. Tepozteco was not liked by the grandparents. When he grew up, he did a marvelous deed, however, by placing the bells on the towers of Mexico City's cathedral in a very strong wind. Tepozteco then returns to his town and builds a house on the top of the hill of the Tepozteco, where he remains to this day. He is the one who causes the winds to blow; he is worshipped by the inhabitants of Tepoztlan.

TRICKSTERS. Tezcatlipoca has many traits which can identify him as a pre-Hispanic trickster. One of his names is *yaotl* ("the enemy"), he who introduces all disagreement in the world. Yaotl seduces Xochiquetzal in Tamoanchan, and therefore is one of the main transgressors. He cheats Quetzal-

coatl and makes him leave his kingdom. He also does many evil things against the Toltecs, thus causing their destruction; at the same time, however, he is also a creator.

But the typical trickster is the Huichol cultural hero Kauymali, or Kauyumalic, who appears through all the mythical time of the Huichol. He is the son of the Sun. He is called "Big Brother"; he is the inventor of many useful things for his people; and he is a great teacher who provides the Huichol with most of their knowledge. Kauymali guides the way of the shaman to their pilgrimage to Wirikuta, the sacred place where the peyote is collected. He disguises himself as a deer and as several other animals, and he is inclined to sexual excesses. He also has a voluble character, is mischievous, and at times even evil. In one of his adventures he fights against the women of vagina dentata.

The Mayan Hunahpu and Xbalanque, as do many of the ethnographic heroes that have been mentioned have also many trickster traits.

TWINS. Twins appear in many of the myths, not only those of Mexico, but in all of the Americas. In pre-Hispanic Mexico, Quetzalcoatl and Xolotl are supposed to be twins. Xolotl sometimes transforms himself into a double maize kernel, or into a double *maguey* cactus. In the ethnographic material, many twins are cultural heroes and tricksters, born in a miraculous way, most found by an elderly couple who try to kill and eat them. The twins, however, after several successful attempts at subterfuge, eventually save themselves and end up killing the elderly couple.

A version of the killing of the elderly couple appears in many stories of cultural heroes—not necessarily twins—who are raised by the grandmother who has a husband-lover who is a deer. When the twins discover this, they kill the deer, stuff his skin with wasps and bees, and when the old woman goes to meet him, the insects come out of the skin and kill her.

Sometimes the twins have to kill a serpent and get hold of the eyes, one of which becomes the sun and the other the moon.

PILGRIMAGE. Another mythic theme is the pilgrimage, on which one seeks a final destiny from an original home of the different ethnic groups. Typically these groups come from caves located in a hill called Chicomoztoc (seven caves). From each cave a different group emerges that is guided by a powerful person who carries a "sacred bundle," within which are contained the relics of the person's patron god, with whom he or she is in communication. The guide later becomes deified. The promised land is marked by a sign.

Even though most Mesoamerican ethnic groups have a story of their pilgrimage, the best known story is the Mexica's, who are guided by Huitzilopochtli till they reach the promised land, which is marked by the sign of the eagle standing in the prickly pear cactus.

Graulich finds the same structure of the banishment of the gods from Tamoanchan in the expulsion of the land of

origin, and, after wandering in darkness, they arrive in the light at the promised land.

The pilgrimage of the Huichol to Wirikuta, the sacred land of the peyote, was performed for the first time by the ancestors, who formed the first group of “peyoteros” who reached the desert of “Real de Catorce.” Here, by trying the psychotropic cactus for the first time, they could become gods and could be transformed in all the elements of nature that their descendants, the human beings, needed in order to live. The route and the adventures that take place in this pilgrimage are sung to the Huichol children by the shamans in a special ceremony. This allows them to travel with their imaginations (Anguiano and Fürst, 1976).

ANIMALS. Animals play an important part in several myths. In many ethnographic groups it was believed that animals and human beings participated in original life together. The Huichol called their mythical predecessors *hewi*, who were animal and person at the same time. In many parts of Mexico, every person has an animal companion that may live in a mountain near the village; when the animal companion suffers an injury, or is killed, the person suffers the same fate. This is a very widespread belief, and since pre-Hispanic times powerful people have believed that they can transform themselves into animals called *nahual*.

In many myths, especially those of the Mayans, it is frequently seen that some animals had previously been human, or that they—the animals—inherited their characteristics from people who lived in other ages (like the *tepezcuintle*, armadillo, squirrels, coatis, racoons and monkeys).

There are also “lords of the animals” who take care that the animals and are not killed in exaggeration by hunters; sometimes the lords of the animals will punish the hunters.

The earth monster is apparently a crocodile in Central Mexico, as well as among the Maya. The very Supreme Creator of the Maya Itzamna is an iguana. Some of the creator gods of the Maya have animal names: *tlacuache*, coyote, great white coati, great boar, and *guacamaya*.

Although there are lots of iconographic representations of the snake, no myths exist about the serpent. The name of the Quetzalcoatl, “Feathered serpent,” seems to be also the name of an old fertility god that blended with the mythical cultural hero. Also among the Maya, the cultural hero and demiurge is called Gukumatz (“feathered serpent”). Among the Huicholes and Coras, a serpent of the West is the personification of nocturnal sky without stars that is conceived as water, and which is pierced by an arrow every morning. Also among the Huichol, water in the form of a snake, associated with thunder, is conceived of as an aquatic goddess who lives in the center of rain clouds.

The dog carries the soul of the dead over the river of the underworld, and a bitch is the ancestor of the human race. The god Xolotl is depicted as a dog.

The opossum steals the fire from the gods, is killed, then made into pieces; it revives; however, and takes the fire to men. López Austin identifies her with Quetzalcoatl.

The people who lived in the second cosmic era were transformed into monkeys. And Hunahpu and Xbalanque transformed their half brothers into monkeys.

BIBLIOGRAPHY

This article is based on Doris Heyden’s article on “Mythic Themes” in the 1987 edition of the *Encyclopedia of Religion*. Included in this entry for the second edition are new approaches by Alfredo López Austin and Michel Graulich about Tamoanchan and themes related to—as well as themes about—sacrifice, cultural heroes, pilgrimage, twins, tricksters, and animals.

The principal sixteenth- and seventeenth-century books from which most of the Pre-Hispanic myths are taken are:

Bierhorst, John, trans. *History and Mythology of the Aztecs: The Codex Chimalpopoca*. Tucson, Ariz., 1998.

Dennis, Tedlock, trans. *Popol Vuh: The Mayan Book of the Dawn of Life*. Rev. ed. New York, 1996.

Durán, Fray Diego. *The History of the Indies of New Spain*. Translated, annotated, and with an introduction by Doris Heyden. Norman, Okla., 1994.

Garibay, Angel María, ed. *Teogonía e historia de los Mexicanos; tres opúsculos del siglo xvi*. Mexico City, 1964. This book includes three important short manuscripts written in the sixteenth century: *Historia de los mexicanos por sus pinturas*, *Historia de México*, and *Breve Relación de los Dioses y Ritos de la Gentilidad*.

Mendieta, Fray Gerónimo de, ed. *Historia Eclesiástica Indiana*. Porrua, Mexico, 1971.

Muñoz Camargo, Diego. *Historia de Tlaxcala*. Tlaxcala, Mexico, 1998.

Sahagún, Fray Bernardino de, ed. *Historia General de las Cosas de la Nueva España*. Porrúa, Mexico, 1956.

Books by Modern Authors on Mesoamerican Myths

Blas Roman Castellón. *Análisis estructural del mito de Quetzalcoatl. Una aproximación a la lógica en el mito del México antiguo*. Mexico City, 1997.

González Torres, Yolotl. *Diccionario de mitología y religión mesoamericana*. Mexico City, 1999.

Graulich, Michel. *Myths of Ancient Mexico*. Translated by Bernard R. Ortiz de Montellano and Thelma Ortiz de Montellano. Norman, Okla., 1999.

López Austin, Alfredo. *Tamoanchan, Tlalocan: Places of Mist*. Translated by Bernard Ortiz de Montellano and Thelma Ortiz de Montellano. Boulder, Colo., 1997.

López Austin, Alfredo. *The Myths of the Opossum: Pathways of Mesoamerican Mythology*. Translated by Bernard Ortiz de Montellano and Thelma Ortiz de Montellano. Albuquerque, 1993.

Monjaraz Ruiz, Jesus, comp. *Mitos cosmogónicos del México Indígena*. Mexico City, 1987. This useful book includes in five

chapters a résumé of myths from different areas of Mexico written by different authors: Mayan myths, pre-Hispanic and modern, by Mercedes de la Garza; Oaxacan myths by Doris Heyden; Nahuatl pre-Hispanic myths and modern nahua myths by Blas Román Castellón; as well as Myths from West of Mesoamerica and Northwest Mexico by María Eugenia Olavarría.xico.

Nicholson, H.B. *Topiltzin Quetzalcoatl: The Once and Future Lord of the Toltecs*. Boulder, Colo., 1992.

Ethnographic Bibliography

There is an enormous amount of ethnographic material which cannot be mentioned in this bibliography. Mentioned here are only a few from where data has been taken for this article. Many of these books are not recent; however, the information contained within them is still valid and is always considered in the new ethnographies.

Baez, Jorge, Félix. *Dioses héroes y demonios*. Xalapa, Veracruz, Mexico, 1997. Two articles of this book are of interest here: "Homshuk y el simbolismo de la ovogenesis en Mesoamerica," and "Kauymali las vaginas dentadas."

Barabas, Alicia and Miguel Bartolomé. "Héroes culturales e identidades étnicas; la tradición mesiánica de mixes y chontales in El héroe entre el mito y la historia." In *UnAM* (2000): 219–234.

Foster, G. H. "Sierra Popoloca Folklore and Beliefs." In *American Archaeology and Ethnology* 42, no. 2 (1945): 117–250.

Fürst, Peter and Marina Anguiano. "To Fly as Birds': Myth and Ritual as Agents of Enculturation among the Huichol Indians of Mexico." In *Enculturation in Latin America: An Anthropology*, edited by Johannes Wilbert. pp. 95–181. Los Angeles, 1976.

Ichon, Alain. *La religión de los totonacas de la Sierra de Puebla*. Mexico City, 1973.

MESOAMERICAN RELIGIONS: HISTORY OF STUDY

A number of diverse primary sources exist for the study of the religious systems of ancient Mesoamerica, foremost among them being archaeological remains. The investigation of these remains provides the only means of obtaining information about Mesoamerican cultures from the Preclassic period (beginning c. 1500 BCE) to the period shortly before the early sixteenth century CE, when the Aztec empire was destroyed by the Spanish. Most of the archaeological remains are structures that were devoted to religious purposes.

EARLY TEXTS. Eighteen pre-Hispanic pictorial documents were saved from the religious zeal of the Spanish conquerors. A number of these are *tonalamatls*, or "books of destiny," which deal with the ritual divinatory calendar of 260 days. They are of special importance for the study of pre-Hispanic religion because they contain in their screenfold pages illustrations of the religious aspects of the calendar, as well as

other esoteric paintings that deal with Mesoamerican astronomical conceptions. Some of these books have not been completely deciphered or interpreted.

The most important *tonalamatls* are six of the Borgia group (originally from the Mixteca-Puebla region), the Dresden Codex (from the Maya area), and the Codex Borbonicus from the Mexican Plateau. Besides these pre-Hispanic manuscripts are others that the Spanish priests and rulers commissioned for their own purposes; these were usually executed in a Spanish pictorial style. Among these commissioned works, the Codex Magliabecchiano and the Florentine Codex, both of which contain important religious data, deserve special mention.

During the century following the Conquest a number of manuscripts were written by priests whose special interest in the religious beliefs and practices of the Indians was dictated by their desire to suppress the indigenous religious systems. Toribio Motolinía was one of the first twelve Franciscan friars to travel, in 1524, to the recently conquered "New Spain" to evangelize the Indians. His work is one of the earliest testimonies on native Mesoamerican culture; unfortunately, only a portion of his writing survives. A reconstruction by Edmundo O'Gorman of the original work has been published under the title *Memoriales, o Libro de las cosas de la Nueva España y de los naturales de ella* (1971).

Without any doubt, the most important work about the customs of the ancient Mexicans is that compiled by Fray Bernardino de Sahagún. His informants were native elders who dictated in Nahuatl to young Indians who had been trained by Sahagún. They produced several manuscripts that have been named after the places where they are now kept: the Florentine Codex and the Matritense Codex. The former is the more celebrated; it is also known under the title given it by Sahagún, *Historia general de las cosas de la Nueva España*. Produced in twelve volumes between 1569 and 1582, it was first published in 1820. It has been translated into English by Arthur J. O. Anderson and Charles E. Dibble and published as *Florentine Codex* (13 vols., 1950–1982). The first five books of Sahagún's work, which deal with the gods, myths, calendar, temples, and priests of the Aztec capital, Tenochtitlan, constitute the most important source for the study of the religion of the ancient Mexicans.

Fray Diego Durán, a Dominican, arrived in New Spain as a child and learned Nahuatl and some of the old traditions from the native people of the Valley of Mexico. He also had access to old manuscripts. He devoted the second volume of his *Historia de las Indias de Nueva España e Islas de Tierra Firme* (concluded 1581) to descriptions of the gods, rites, and calendar of ancient Mexico. Fray Diego de Landa, who was responsible for the burning of massive numbers of precious ancient Maya manuscripts in the city of Mani in 1562, was also the author of the most important early book about Maya culture and religion, *Relación de las cosas de Yucatan* (first published in 1864). Fray Juan de Torquemada, a Franciscan, was the first person to write a "comparative" history

of the peoples of New Spain. He was deeply interested in historiography, and many of the long digressions in his book *Monarquía indiana* (1615), which utilize biblical and classical references, were designed to show that the aboriginal Indian cultures followed universal laws of history. Four chapters of his book contrast native religion with the “true” religion, Christianity. Also of interest to the study of religion are the *Códice Chimalpopoca*, *Anales de Cuauhtitlan*, and *Leyenda de los soles*, three manuscripts written in the second half of the sixteenth century, two anonymous in Nahuatl and one in Spanish by Pedro Ponce and the *Historia de Tlaxcala*, written in the sixteenth century in Spanish by the mestizo Diego Muñoz Camargo.

THE EIGHTEENTH CENTURY. The Jesuit priest Francisco Javier Clavigero was fluent in Nahuatl and had some knowledge of other Indian languages. He was the first to write a work devoted solely to the history of Mexico, his *Storia antica del Messico* (1780–1781), written and published in Italy during his exile there. The work contains an excellent chapter on religion. Although in his writings Clavigero tends, as might be expected given the time during which he wrote, to use Christian scripture and theology as norms of judgment, this tendency hardly colors his description of native religion. Indeed, it surfaces only in one passage within which he characterizes the ancestral religion of the Indians as a jumble of mistaken, cruel, and childish practices—the knowledge of which might help the ancient Indians’ descendants to see the great advantages of Christianity. Clavigero shared the belief, widespread among his contemporaries, that the ancient Mexicans displayed knowledge of biblically recorded events, and he reiterates the belief, then common, that Quetzalcoatl was none other than Thomas, the disciple of Jesus, who had traveled to America to evangelize its inhabitants. Clavigero’s book was widely read, and it helped to further a growing interest in the history and culture of ancient Mexico. It also fostered the spirit of nationalism among New Spain’s mestizo population.

MEXICO AFTER INDEPENDENCE. Shortly after Mexican independence in 1821, the Museo Nacional was established to house pre-Conquest antiquities. In conjunction with the museum’s founding, a number of studies of Mexico’s ancient culture were carried out. Influenced by current liberal, positivistic ideas, a group of Mexican scholars began to study the ancient Mexican civilizations. Manuel Orozco y Berra, Francisco del Paso y Troncoso, Cecilio A. Robelo, and Alfredo Chavero were the first to investigate Mesoamerican religions in this new manner. The first volume of Orozco y Berra’s *Historia antigua y de la conquista de México* (4 vols., 1880–1881), is devoted to a study of native myths and thought, which he compares to Pythagorean and Hindu philosophies, doubtless with the purpose of demonstrating the universal value of Nahuatl ideas. Among other works of scholarship produced were Paso y Troncoso’s erudite and well-documented commentary, *Codex Borbonicus: Descripción historia y exposición del códice pictórico de los antiguos náhuatl* (1898). Robelo compiled a *Diccionario de mitología nahuatl*

(2d ed., 1911), which contains source material and scholarly interpretation about ancient Mexican religion in general. Chavero wrote several works on ancient Mexican religion, including *Historia antigua y de la conquista* (1888), the first volume of an ambitious publication project directed by D. V. Riva Palacio and titled *México a través de los siglos* (Mexico through the Ages). In this volume, Chavero espouses the belief that religious ideas provide a means of measuring the degree of advancement of the Mexican people and of determining their social tendencies. He maintains the thesis that native Mexican religion was materialistic inasmuch as it did not include a belief in a spirit or a soul. Later scholars have dismissed Chavero’s interpretations as sheer fantasy.

The commencement of the publication of the periodical *Anales del Museo Nacional de México* in 1877 marked the transformation of research from a private endeavor into an academic pursuit in Mexico. During the second half of the nineteenth century, the Mexican contribution to the reconstruction of the Indian past was greater than that of any other national group.

OTHER NATIONAL SCHOOLS OF THOUGHT. The German traveler, naturalist, and man of letters Alexander von Humboldt visited New Spain in 1803–1804 and brought back to Europe a vision of the New World that had up until then eluded the attention of European scholars. Humboldt was so impressed by the vestiges he saw of the ancient pre-Columbian cultures that he proclaimed these civilizations comparable to that of ancient Egypt. He published his most important books on the Americas in French. In one of them, *Vue des Cordillères, et monuments des peuples indigènes de l’Amérique* (1810), which contains paintings and images that captured interest, he deals extensively with the pre-Hispanic calendars, myths, and rituals. By the second half of the nineteenth century, waves of European travelers were visiting Mexico. They made drawings and took photographs of the pre-Hispanic ruins and carried off ancient manuscripts and objects, thus broadening interest in the ancient Mesoamerican cultures.

France. In 1858, a group in France founded the Société des Américanistes de France and started a specialized journal. As an outgrowth of this, the first Americanist congress was held in Nancy in 1874. Some of the first French scholars to write about Mesoamerican religion were Albert Réville (*Les religions du Mexique de l’Amérique Centrale et du Pérou*, 1855), Hyacinthe de Charency (*Le mythe du Votan*, 1871), and Léon de Rosny (*L’interprétation des anciens textes Mayas*, 1875, among dozens of other works). Much later, the ethnologist Jacques Soustelle, of the French sociological school, worked in the field of Mesoamerican religion. In his book *La pensée cosmologique des anciens Mexicains* (1940), Soustelle claimed that the Mexican image of the universe reflected the people who created it, and he asserted that the gods Huitzilopochtli and Quetzalcoatl corresponded to the ideals of a distinct faction of the dominant class of Aztec society.

Germany. From von Humboldt's time up to the present, German scholars have been producing studies on the subject of Mesoamerican religion, either as parts of works about religion in general (e.g., Friedrich Majer's *Mythologische Taschbuch oder Darstellung und Schilderung der Mythen: Religiösen Ideen und Gebrauche aller Völker*, 2 vols., 1811–1813) or in the form of monographs specifically focusing on Mesoamerica (e.g., J. G. Müller's *Geschichte der amerikanischen Urreligionen*, 2d ed., 1867; and Konrad Haebler's *Die Religionen mittleren Amerika*, 1899). From the analysis of the Mayan Codex Paul Schellhas extracted the first classification of the Mayan gods (*Die Götter festallen der Maya Handschriften. Ein Mythologisches Kulturbild aus dem Alten Amerika* 1897).

Perhaps the most eminent scholar of Mesoamerican religion that Germany produced was Eduard Seler. He was influenced in his interpretations of the origin of myths by his contemporary F. Max Müller (1823–1900), and even more by Ernst Siecke's ideas concerning lunar mythology. Seler's most important work was his commentary on *Codex Borgia: Eine altamerikanische Bilderschrift der Bibliothek der Congregatio de Propaganda Fide* (3 vols., 1904–1909). The first part of volume 4 of Seler's collected works (*Gesammelte Abhandlung zur amerikanischen Sprach- und Altertumskunde*, 5 vols., 1902–1915) is devoted to the mythology and religion of the ancient Mexicans. Hermann Beyer, one of Seler's followers, published more than forty articles (1908–1924) relating to pre-Hispanic religion and symbolism which were published in 1965 in vol. X of *El Mexico antiguo*. Beyer tried to prove that the Aztec's vision of the cosmos was monistic and pantheistic.

Another of Seler's disciples, Konrad T. Preuss, was the first to use pre-Hispanic Mesoamerican religion as the basis for ethnographic studies. His most important work was *Die Nayarit-Expedition*, volume 1, *Die Religion der Cora-Indianer* (1912). Walter Krickeberg in 1928 published a compilation of American myths, *Märchen der Azteken und Inkaperuaner, Maya und Muisca*; in 1956 he brought out *Altmexikanische Kulturen*, in which he emphasized the strong connection between religion and art in Mexican thought.

England. The interest in American antiquities was stimulated in England by E. K. Kingsborough's project, *Antiquities of Mexico*, which eventually produced nine huge volumes (1830–1848). For the most part, British scholars specialized in Maya archaeology. Among them was J. Eric S. Thompson, who from 1927 to 1972 published a number of books and articles and contributed to the deciphering of Maya hieroglyphic writing. In *Maya History and Religion* (1970), Thompson summarized all his research. In his last years, he expressed doubts about the possibility that Maya religion will ever be thoroughly understood, especially given the kind of data that are available to scholars.

Lewis T. Spence, the British historian and mythologist, took quite a different approach; he was one of the few students of Mesoamerica who were primarily specialists in reli-

gion. Besides his books on the Americas (e.g., *The Mythologies of Ancient Mexico and Peru*, 1907; *The Civilization of Ancient Mexico*, 1912; *The Myths of Mexico and Peru*, 1913; *The Gods of Mexico*, 1923; and *The Magic and Mysteries of Mexico*, 1930), he wrote about the legendary continents of Atlantis and Lemuria and about the mysteries of ancient Britain and Spain and those of Egypt, Rome, Babylonia, and Assyria. Spence is noted for introducing some ideas that retain importance for contemporary scholars. For instance, he claims that Quetzalcoatl's cult was a "wisdom"-type religion that taught a highly developed form of mysticism and that was similar to the mystery religions that flourished in ancient times in Britain, Greece, and Egypt. The differences between Old and New World systems were superficial, he said, and they arose from a variance in magical practices. The Mesoamerican mystery religion was basically a complex rain cult upon which the solar cult and, later, the Quetzalcoatl rain cult had been superimposed.

United States. Another important researcher in the field of Mesoamerican mythology was Daniel Garrison Brinton. His most important works were *The Myths of the New World: A Treatise on the Symbolism and Mythology of the Red Race of America* (1868) and *Nagualism: A Study in Native American Folklore and History* (1894). Brinton claimed to be using modern methods of scholarship and, in contrast to prevailing scholarly consensus, maintained that the gods of the American tribes had their origins in the observation of natural phenomena rather than in historical chiefs or heroes. He tried to prove that the gods of Mesoamerica were human and benign, that they were loved rather than feared, and that their worship carried within it the seeds of benevolent emotion and sound ethical principles.

One of the great scholars of Maya ritual and religion was Alfred Tozzer who did important archaeological work in Tikal and Chichén Itzá and who developed a meticulous method for organizing his field work. Tozzer looked for contemporary survivals of the prehispanic Maya ritual. In his 1907 *Comparative studies of the Maya and the Lacandon* he dedicated more than half the book to the description of rites and ceremonies, which the author had the opportunity to witness.

The Norwegian scholar Carl Lumholz led a Mexican expedition that was sponsored by American Institutions during the last decade of the nineteenth century, which uncovered vivid examples of religiosity and daily life among tribes of the western Sierra Madre. He was allowed to photograph places and ritual practices as well as interview and collect oral traditions and myths. His *Symbolism of the Huichol Indians* (1900) and *El México desconocido* (1904) provide important data about the world view and ritual life of the Huichol and the Tarahumara peoples.

CONTEMPORARY PERSPECTIVES. During the 1930s and 1940s there was some pioneer ethnographic and historical research done, like Alfonso Villa Rojas's *Dioses y espíritus paganos de los mayas de Quintana Roo* (1941), George Foster's

Nagualism in Mexico and Guatemala (1944), and Robert M. Zingg's *The Huichol, Primitive Artists* (1938). In 1949 the Sociedad Mexicana de Antropología started organizing their Round Tables in which important Mesoamerican themes were discussed.

During the 1950s several important books on the subject of Prehispanic Mesoamerican religions appeared. One of these, *El pueblo del Sol* (1953), by the Mexican archaeologist Alfonso Caso, was the first book written on a popular level to give a general overview of Aztec religion. Caso distinguished three levels of religiosity in Aztec culture: the popular and polytheistic, the priestly, and the philosophical, which, according to Caso, almost attained monotheism. He stressed that the Aztec's actions and, indeed, their very sense of life were derived from the belief that they were a people with a mission. The Aztec conceived of themselves as a people favored by the Sun, allied to the forces of goodness and engaged in a moral struggle against the forces of evil.

One of the most articulate voices on Mesoamerican philosophy and religion is Miguel León-Portilla, whose many books and articles have set a standard for writing about worldview, metaphor and poetry. His first book, *La filosofía náhuatl* (1956; *Aztec Thought and Culture*, in English, 1956), attempted to demonstrate that among the ancient Mexicans there was a group of genuine philosophers distinct from the class of priests. He argued that there existed among the ancient Mesoamericans two opposite points of view regarding life and the universe. One was mystic-militaristic, oriented toward war and bloody sacrifice (the main purpose of which was to preserve the life of the sun, which was menaced by the threat of final cataclysm). The other worldview, represented by the Nahuatl symbol for knowledge, Quetzalcoatl, was philosophical and attempted to find the meaning of life through intellectual means. León-Portilla, in his *Tiempo y realidad en el pensamiento Maya* (1968; *Time and Reality in the Thought of the Maya*, in English, 1973), provides us with a useful overview of how time and the passage of time was understood to permeate every level of daily life and reality among the Maya. He later wrote other books, including *La religión de los nicaraos* (1972) and *Mexico Tenochtitlan, su espacio y tiempo sagrados* (1978). Appended to *Tiempo y realidad* was included Villa Roja's important essay "Los conceptos de espacio y tiempo entre los grupos mayences contemporáneos."

Corona Núñez wrote two books on the Tarascan: *La religión de los tarascos* (1957) and *Mitología tarasca* (1962). Pedro Carrasco (1950) wrote an ethnohistorical study on the Otomí, and Barbro Dahlgren (1954) on La Mixteca with very important sections on the religion of these ethnic groups.

French archaeologist Laurette Séjourné's *Burning Water: Thought and Religion in Ancient Mexico*, (1957) synthesizes her interpretations of Mexican religion. According to her, the myth of Quetzalcoatl constitutes the paradigmatic revelation at the heart of Aztec tradition, and can be com-

pared to some of the world's great religions. For Sejourne, the chief difference from other great religions was to be found in the distinctive symbolic language of the Quetzalcoatl tradition, which reveals that the human soul passes thorough different stages and ordeals until it reaches a liberated consciousness.

From the 1950s and especially in the 1960s there was an increase in the ethnographic research with an emphasis in indigenous cosmologies and religious practices, including beliefs related to medicine, Indian and Spanish syncretic religion. Most of these studies were made under research projects of the University of Chicago and Harvard University. Many themes are still relevant, including: fertility associated with death; the importance of agricultural myths—especially the ones associated with the rain cycle; the concepts of cold and hot, of the soul, of *tona* and *nagual*; diseases related to the spiritual sphere; and the ritual specialists who had as their main task curing people. While much of this research was synthesized in articles published in the *Handbook of Middle American Indians*, one article in particular constitutes a watershed in the study of Mesoamerican religions, H. B. Nicholson's classic study "Religion in Prehispanic Central Mexico" which appeared in Vol. X (1971) provides us with a thorough account of prehispanic Central Mexican religion. This essay gives special attention to cosmogony, cosmology, major cult themes, deities, and ritualism based on the archaeological, documentary and pictorial sources, and on the authors who had dealt with the themes up to his publication.

In volumes VII and VIII devoted to Ethnology, specialists wrote about the different ethnic groups, each with a section on religion. Volume VI on Social Anthropology (1967) included several articles related to religion: William Madsen's "Religious syncretism," Frank Canciani's "Religious and Political organization," and Michael E. Mendelson's "Ritual and Cosmology," based on his own investigations and the ethnographic studies published so far by several authors. He directs his attention to Indian and Spanish acculturation, giving priority to the Mayan people, to the distribution of ritual personnel, and to the general study of the forms of ritual and the contents of myth.

Other important books written during these years were Guiteras Holmes's *Perils of the soul* (1961); Holland's, *Medicina maya en los Altos de Chiapas* (1963); Aguirre Beltrán's *Medicina y magia, el proceso de aculturación en la estructura colonial* (1963); and Alain Ichon's *La religion des totonaques* (1969).

In 1972 the twelfth "round table" of the Sociedad Mexicana de Antropología was held in Cholula, Mexico. During the conference, which was titled "Religion in Mesoamerica," ninety-six scholars presented papers, most of which were later published in a volume (1972) and were the seeds of new full investigations. Discussion at the conference centered on a perennial question in Mesoamerican studies: is "Mesoamerican religion" one religious system or many? On one side of the argument were Alfonso Caso and Jiménez More-

no, who posited the unity of the Mesoamerican religions. On the other side was George Kubler, who argued for a Mesoamerican co-tradition following Bennet's 1948 proposal for Peruvian co-tradition. The problem of methodology was raised again during the conference by Kubler's critical voice against the validity of using modern ethnological analogies explaining prehispanic religion. In fact, Kubler was against using even sixteenth century colonial analogies to interpret prehispanic religion explaining older Mesoamerican cultures. He proposed instead Panowsky's principle of disjunction.

Modern Mesoamerican ethnographic studies have proven a unity of Mesoamerican culture, including cosmovision and religion. In 1973 the first Round table of Palenque organized by Merle Green took place and has continued to the present publishing the proceedings, which are the results of important studies.

From the late 1970s, new discoveries in the fields of Mesoamerican ethnography, archaeology and Maya epigraphy have led to an increasing amount of research dealing with the religious systems of Mesoamerica. It includes new types of theoretical trends, such as Marxist, structuralist, cognitive anthropology, symbolic anthropology, phenomenology, hermeneutics, and the scientific study of religion. The increase in publication is so vast that it is impossible to mention all the names involved, therefore only the most significant will be noted.

Eva Hunt, in her book *The Transformation of the Hummingbird: Cultural Roots of a Zinacantecan Mythical Poem* (1977), claims to employ the social-scientific theories of Auguste Comte, Karl Marx, Émile Durkheim (1858–1917), Sigmund Freud (1856–1939), Claude Lévi-Strauss, and Victor Turner—among others—as tools of interpretation. She interprets a modern Maya-Zinacantecan poem in light of its antecedents in Mesoamerican mythology. She concludes that Mesoamerican religion is of a type characteristic of agrarian states, and that it is based upon an agrarian paradigm of space and time.

Other authors who wrote important books on mayense groups include Gary Gossen, *Los chamulas en el mundo del sol* (1979), and Evon Z. Vogt, *Ofrenda para los dioses* (1983).

Alfredo López Austin has contributed many new ideas to the field of Mesoamerican religions. His book *Cuerpo humano e ideología* (1980) examines Nahuatl concepts concerning the human body (of which the soul was considered a part) from within a frame constructed through an understanding of the society from which these concepts arose. López Austin's interpretations of what he calls "soul entities" represent a new kind of reading of ancient Mesoamerican religious thought. He has also put forward the hypothesis of a "hard nucleus" of Mesoamerican culture, a complex of ideas quite resistant to change, but with a dynamic cultural unity which admitted cultural variations, and is followed by almost all Mexican Mesoamericanists.

In his publications *Los mitos del tlacuache* (1990) and *Tamoanchan* (1993), he studies cosmic typology and its sig-

nificance, the foundation of Mesoamerican mythology from prehispanic times to the present, and proposes an archetype of vegetable type with concepts concerning vegetation and the life and death cycle, which emphasizes the preeminent role of maize.

López Austin also develops cosmological conceptions of the duality of the mythic Tamoanchan and Tlalocan. For him Tamoanchan is the great cosmic tree situated in the center of the universe, which sinks its roots into the underworld and extends its foliage into heaven. Through its two intertwined trunks, in a helicoidal form, run the streams of opposite forces which, in their struggle, produce time.

A number of scholars, including Michael Graulich, Doris Heyden, Johanna Broda and Yolotl González, have explored the diversity and complexity of Mesoamerican mythologies. Graulich believes that a fundamental pattern in mythology follows the transgressions of the gods and their expulsion from paradise, resulting in human strategies of sacrifice in order to return, in some symbolic or actual way, to a glorious world. Doris Heyden's work has shown how plants, caves, and stones were understood to be imbued with mythic powers and thereby became substances that enabled commoners and elites alike to participate in the worlds of the gods. González Torres shows us how myths of sacrifice not only served as models for ritual sacrifice but also functioned to weave political authority and hegemony together with religious power and prestige. Broda has given special importance to rituals, above all to agricultural rituals and to hills as models of the universe and as *axis mundi*—the center of the world. She sees in all these a reflection of the observation of nature and the cosmos.

Among the many authors who have written about the religion of the Mayans is Mercedes de la Garza, whose methodological approach is the science of religion. She considers Maya religion as a cultural phenomenon by itself, leaving behind interpretations of archeology and other disciplines. Her books include: *El universo sagrado de la serpiente en el mundo maya* (1984) and *Sueño y alucinación en el mundo nahuatl y maya* (1999).

Other authors who have written about Maya religion, are Karl A. Taube, *The Major Gods of Yucatan* (1992), Linda Schele and Mary Ellen Miller, *The Blood of Kings* (1989), and David Freidel, Linda Schelle, and Joy Parker, *Maya Cosmos: Three Thousand Years on the Shaman's Path* (1993). The authors of these books analyze through iconography and epigraphy sacrificial practices and the development of Maya religion and cosmology. Since the 1990s, epigraphic discoveries of David Stuart and Stephen Houston on supernatural domains and spiritual essences have added to the religious knowledge of the Classic Maya.

TYPES OF STUDY. The study of Mesoamerican religions has been the domain of archaeologists, ethnologists, art historians, historians of religion, and sociologists. Most of the literature has been published in anthropological journals, such

as *American Anthropologist* (Washington, D.C., 1899–), *Anthropos* (Salzburg, 1906–1979), *Zeitschrift für Ethnologie* (Berlin, 1869–), *Anales del Museo Nacional* (Mexico City, 1877–1945), *Estudios de cultura náhuatl* (1959–), *Estudios de cultura maya* (1962–), *Tlalocan* (1943–) and many other magazines. A newer one is *Arqueología* (1993–), which has articles on Mexican anthropology and history superbly illustrated, with religion occupying an important place. There have been other articles on “Mexican gods,” “sacrifice,” “rituals” and so on, written by specialists on the particular subjects.

Several museums in Mexico, the United States, Europe, and Asia have held exhibitions of prehispanic objects, most of which are religious, having been found in burial sites and ceremonial centers. These exhibitions have added to the knowledge and the diffusion of prehispanic culture and religion. The most relevant have been: “The Blood of Kings,” Forth Worth, Tex. (1986); “Aztec, the World of Moctezuma,” Denver, Colo. (1992); “Teotihuacan. Art from the City of Gods,” San Francisco (1993); “Gods of Ancient Mexico,” Mexico City (1995–1996); “The Mayans,” Venice and Mexico City (1999); “A Trip Through the Land of the Gods,” Amsterdam (2000); and “Aztecs,” London (2002) Berlin (2003) and Washington (2004).

Some exhibitions’ catalogues reprint material already discussed in other publications, while others offer new research and become texts in their own right.

There are articles written by different scholars about Mesoamerican religion in encyclopedias of world mythologies or religion (*Larousse World Mythology*, 1988, *Man and His Gods*, 1971) or general histories of religion, like Francisco Diez de Velasco’s *Introducción a la Historia de las Religiones* (2002). Dictionaries of Mesoamerican religion have also been published, including: Yolot González’s 1991 *Diccionario de Mitología y Religión mesoamericana* and Mary Ellen Miller and Karl Taube’s 1993 *The Gods and Symbols of Ancient Mexico*.

Many research and educational institutions, especially in Mexico, are doing research on Mesoamerican religion, including: the National Institute of Anthropology and History (INAH) with its different museums and regional centers; several research institutes of the National Autonomous University (UNAM); and many other universities and educational centers. The French Center for Latin American Studies (CEMCA), the Italian Mission Italiana and the Polish Center for Latin American Studies have produced books like J Gallinier’s *La mitad del mundo en la cosmovisión otomí* (1990); Guillaume Olivier’s 1997 *Moquerie et métamorphosis d’un dieu azteque. Tezcatlipoca (Mockeries and Metamorphoses of an Aztec God: Tezcatlipoca, in English)*; Anne-Marie Vié-Wohrer’s 1999 *Xipe Totec, Notre Seigneur l’Ecorché*; Italo Signorini and Alessandro Lupo’s *Los ojos de la vida, alma, cuerpo y enfermedad entre los nabuas serranos* (1989); Lupo’s *La Tierra nos escucha* (1995); and Andrez Wiercinski’s *Tlillan Tlapallan. Estudio de la religión mesoamericana* (1998).

Alcina Frank has written “Dioses zapotecas,” 1972, and *El temazcal* (Mesoamerican steam bath), 1999. Rivera Dorado wrote *Religión maya* (1986).

The study of Mesoamerican religions received a major stimulus from the stunning discoveries made in downtown Mexico City by Proyecto Templo Mayor between 1979 and 1985. Led by Eduardo Matos Moctezuma, this truly multidisciplinary excavation uncovered the primary religious shrine of the Aztec Empire. The dig uncovered seven complete rebuildings of the Great Temple. Most amazing were the excavations of over 115 ritual caches buried by the Aztecs at key religious ceremonies between the fourteenth and sixteenth centuries. Among the many important works written about these discoveries is Leonardo López Luján’s excellent synthesis “Offerings of the Templo Mayor of Tenochtitlan.” This is one part of Templo Mayor studies developed in a twenty-year collaboration between Eduardo Matos and David Carrasco, who set up the Mesoamerican Archive at the University of Colorado in 1984. Together they have organized important investigations of archeological, ethnohistorical and ideological analysis of sacred space, urban plans and ceremonial practices in ancient Mesoamerica. At Harvard University’s Peabody Museum, the archive, in collaboration with the University Press of Colorado, has launched a series “Mesoamerican Worlds” which has published results in books, including *To Change Place: Aztec Ceremonial Landscapes* (1991). Carrasco is the author of *Religions of Mesoamerica: Cosmology and Ceremonial Centers* and was the editor-in-chief of the three-volume *Oxford Encyclopedia of Mesoamerican Culture* (1999).

Mesoamerican religion is a topic—and sometimes main theme—of numerous meetings of institutions and associations, including: Americanists Congress, American Anthropological Association, Dumbarton Oaks Foundation, and recently, the International Congress of the History of Religion.

The Instituto de Investigaciones antropológicas de la UNAM and the Sociedad mexicana de Estudios de la Religión A.C. organized three colloquia under the name of Historia de la Religión en Mesoamérica y áreas afines. Its proceedings were published by Barbro Dahlgren in 1987, 1990, and 1993.

Recent years have seen an explosion of ethnohistorical and interpretive publications. Significant work has been performed by art historians who have developed a new grasp on the iconographic traditions relating religiosity to politics and art styles. Especially important are the works by Doris Heyden, George Kubler, H. B. Nicholson, Esther Pasztory, Richard Townsend, Elizabeth Boone and Carmen Aguilera. The growing community of Mesoamerican scholars who have developed intensive dialogues among themselves has resulted in a loss of interest in cross-cultural analysis between Mesoamerica and other parts of the world. This is due in part to the recent discrediting of the diffusionist approach of earlier scholars. It may be that in time, new comparative studies will result in useful tools for developing broader views for the

rise and complexity of state societies. While historical interpretations of myths continue to dominate the scholarship, a small but potent series of publications drawing on the structuralist approach continue to contribute to our understanding of religion an ideology.

The problem of myth and history has continued to engage scholars such as López Austin, González Torres, Enrique Florescano, David Carrasco and H. B. Nicholson, particularly in regard to the Toltec tradition. Carrasco (*Quetzalcoatl and the Irony of Empire*) and Florescano (*Quetzalcoatl y los mitos fundadores de Mesoamérica*) argue, in different ways, that Teotihuacan either stimulated the idea of Tollan in the minds of Mesoamerican people, or was the original Tollan. In a recent celebrated publication, H. B. Nicholson (*Topiltzin quetzalcoatl: The Once and Future Lord of the Toltecs*) outlines the possibility of some degree of historicity in the Topiltzin Quetzalcoatl of Tollan tale. Others, including López Austin and López Luján, emphasize that Quetzalcoatl and Tollan were understood primarily as mythic sites and figures.

Due in part to the leadership of Anthony Aveni, Franz Tichy, Johanna Broda, S. Milbrath and Y. González, Mesoamericanists have placed an increasing emphasis on astronomical alignments, appearances and patterns in their interpretations of Mesoamerican religions and societies. New fields of study, including archaeoastronomy and ethnoastronomy, have emerged as a result of their publications, and a series of productive conferences in Mexico, the United States and Europe have taken place.

Other studies explore the relationships between energy, man, and the cosmos in ancient and modern Mesoamerican thought. These concepts have been associated with the concept of *mana*. Several authors have linked these concepts with hot (positive) and cold (negative) energy which circulates between the underworld, earth and the supraworld through cosmic trees, and also with the acute consciousness of entropy—which, according to Christian Duverger in his *La fleur létale: Économie du sacrifice aztèque* (1979), characterized the thought of the Aztec.

Concepts about the relation of man to nature and the cosmos present in beliefs, symbols, and rituals permeate almost all Mesoamerican research. Important also has been the research about religious specialists: *rezanderos* (shamans and healers) and *graniceros* (diviners and witches).

For a long time, the main task for all scholars studying Mesoamerican traditions has been to gather all available ethnohistorical and ethnographic material and to attempt, on the basis of this evidence, to reconstruct the different aspects of Mesoamerican cultures, including their religious systems. This reconstruction continues, as new archaeological and ethnographic discoveries are constantly providing new data. New ethnological studies have shown that it is possible to use knowledge of modern Indian religions to help interpret data concerning pre-Conquest religion, and vice-versa. It shows

the unity and continuity of Mesoamerican cosmivision, in spite of the superimposition of Catholicism, which has led to the syncretic religion that has been called “popular religion” and has become a wide field of study. One of the most prolific writers on this field is Félix Baez Jorge, the author of *Los oficios de las diosas* (1988), *Las voces del agua* (1992), *La parentela de María* (1994), and *Nahuales and Santos* (1998). Also important is James Dow, author of *Santos y Supervivencias* (1974), *Giménez Gilberto* (1978), *Cultura Popular y religión en Anahuac*, Gonzalo Aguirre Beltrán (1986), and *Zongolica: encuentro de Dioses y Santos Patronos*.

Isabel Kelly (1961), Isabel Lagarriga (1975) and Silvia Ortiz Echaniz (1991) have studied the “espiritualismo trinitario mariano,” a widespread popular religion which gives great importance to spiritual healing.

The role of religion and identity consciousness has also become an important aspect of study, linked to nativism and revival religions. One area in particular has received scholarly attention, resulting in three powerful publications: The contemporary religious practice in communities near Lake Atitlan in Guatemala have been effectively studied by Robert Carlsen (*War for the Heart and Soul of a Highland Maya Town*), Vincent Stanzione (*Rituals of Sacrifice: Walking the Face of the Earth on the Sacred Path of the Sun, a Journey Through the Tz'Utujil Maya World of Santiago Atitlan*) and Nathaniel Tarn and Martin Prechtel, (*Scandals in the House of Birds: Shamans and Priests on Lake Atitlan*).

Indian symbolic reelaboration of Christian stories and calendric festivals like the celebration of the Holy Cross in May and the day of the death in November, as well as the carnival and Holy Week, sanctuaries, pilgrimages, religious dances and the cult of the Virgin of Guadalupe, so strongly linked to Mexican identity, have produced a number of investigations (De la Maza 1981, Nebel 1992, Noguez 1993). Since the 1980s there has been a rapid spread of Protestantism in Mesoamerican communities, especially among the mayense groups of Mexico and Guatemala. This, and the influence of the Catholic Liberation movement, has greatly changed the cosmivision of the different ethnic groups and has led to much religious conflict.

Also appearing are revival and nativist movements, formed mostly by non-Indians, influenced by New Age ideas and pan Indian movements. They try to revive an idealized Aztec religion, denying the practice of human sacrifice. They have adopted as one of their main rituals the “concheros” or Aztec dance and claim that the main archaeological sites are their places of worship, charged with the sacredness of “their ancestors,” especially in the equinoxes and the solstices. Some groups have adopted the North American Lakota dance of the sun as their most important ritual. These revivalist religious movements are spreading rapidly throughout Mexico, among the Mexican Americans, and even in Europe. There is also a group of priests, who after the Second Vatican Council (1962–1965), where it was decided that the people had cultural and religious rights, have followed what they call

the Indian theology. They argue that the Indians have had their own theology since prehispanic times and that now there should be a dialogue between the Christian theology and the religiosity of the Indian populations.

- HISTORY OF STUDY

MESOPOTAMIAN RELIGIONS: AN OVERVIEW [FIRST EDITION]

Ancient Mesopotamia is the country now called Iraq. Its northern part, down to an imaginary line running east-west slightly north of modern Baghdad, constituted ancient Assyria, with the cities of Ashur (modern Qal'at Shergat), which was the old capital; Calah (Nimrud); and Nineveh (Kouyundjik), which took its place later, at the time of the Assyrian empire in the first millennium BCE. The country consists of rolling plains resting on a bed of rocks. Rainfall over most of the area is sufficient to sustain a cereal crop. The main river is the Tigris, which traverses the country from northwest to southeast. The language spoken in historical times was Assyrian, a dialect of Akkadian, a Semitic language related to Hebrew and Arabic.

The southern part of Mesopotamia, south of the imaginary line mentioned, was ancient Babylonia, with Babylon (Babil) as its capital. The country here is flat, alluvial plain, and the average rainfall is too scant to allow a cereal crop. The country thus depends on artificial irrigation for its agriculture. It was in antiquity crisscrossed by a formidable net of rivers and canals. Such rains as fall are, though, sufficient to bring up pasture of grasses and herbs in the desert for a short grazing season in the spring. The language spoken was the Babylonian dialect of Akkadian.

The designations *Assyria* and *Babylonia* are appropriate only for the second and first millennia BCE, or, more exactly, from about 1700 BCE on, when Ashur and Babylon rose to political prominence. Before that time the later Assyria was known as Subartu, while what was to become Babylonia consisted of two main parts. Dwellers of the region north of an imaginary line running east-west slightly above Nippur (Nuffar) in historical times spoke Akkadian, while those of the region south of it spoke Sumerian, a language unrelated to any other known language or language family. The northern region was known as Akkad in Akkadian and as Uri in Sumerian, while the southern one was called Sumer or, more correctly, Shumer in Akkadian, Kiengir in Sumerian.

The capital of Akkad was in early times the city of Kish (Uheimir); later on, the city Akkad (not yet located) took its place. The country was traversed by two rivers, the Tigris flowing along the eastern border areas and the Euphrates farther to the west. The course of the Euphrates was, however, not the same then as it is today. Its main branch flowed by

Nippur and east to Shuruppak (Fara), then south to Uruk (Warka), and on to Ararma (in Akkadian, Larsa; now Senkereh) and Ur (Muqayyir). Above Nippur an arching branch, the Arah-tu, took off in a westerly direction, flowing by Babylon before rejoining the main course; another branch flowed south to Isin (Ishan Bahriyāt). In an easterly direction a major arching branch, the Iturungal, took off, flowing by Adab (Bismāya) to Zabalam (Bzeikh), Umma (Joha), and Patibira (Medina) before rejoining the main course at Ararma. At Zabalam the Iturungal sent a branch east, then south, to serve Girsu (Tello), Lagash (Tel al Hiba), and Nina (Zurghul). The main course of the Euphrates south of Uruk sent a branch south to Eridu (Abu Shahrein).

Economically, as mentioned, both Akkad and Sumer depended mainly on irrigation agriculture. There were, however, also other important economies. The region around Uruk and south along the Euphrates was, then as now, famous for its date groves; herding of sheep and oxen provided wool and dairy products as well as meat; fishing and hunting were important along the rivers and in the southern marshlands.

Capital cities in Sumer were Uruk and Ur; later on, Isin and Ararma. Of central religious and political importance was Nippur, seat of the god Enlil.

HISTORY. The earliest settlement of Mesopotamia of which we have evidence took place in the north, in the plains of the later Assyria. Here small agricultural villages, dependent essentially on rain agriculture and herding, occurred as early as the seventh millennium BCE. In the south, the later Babylonia, settlement began in the sixth millennium only, with what is known as the Ubaid period. The people who settled were most likely the forebears of the later Sumerian-speaking people of the region. Their settlement form seems originally to have been one of campsites and seminomadic small villages located along natural watercourses. They depended partly on irrigation hoe agriculture, partly on herding and fishing. Each tribe had a fixed center, a “treasury” in which it kept stores and religious objects that would have been inconvenient to take along on wanderings. Such tribal centers appear to have formed the nuclei of many of the later cities and central sanctuaries, to judge from their names.

The period of the earliest occupation, the Ubaid period, was a long one, and it saw, toward its end, the rise of the first cities. They lined the edge of the southern marshes and may well have owed their existence to a combination of the varied economies of the region: irrigation farming, herding, fishing and hunting; the key requirement for the rise of a city is the availability of economies able to sustain a massing of population on a small space.

Among these first cities were Eridu, Ur, and Uruk, and with the Uruk period, which followed in the late fifth millennium, the cities and the lifestyle they fostered had grown to a point where, as the period was coming to an end around 3500 BCE, we can speak for the first time of true civilization,

characterized by magnificent sculpture, monumental architecture, and—most important of all—the invention and development of writing.

As to political forms then in vogue, the occurrence of the term for general assembly (*unkin*) in the early inscriptions is of interest. It belongs in a political pattern called “primitive democracy.” Supreme power was vested in a general assembly, which served as a court, as a legislative assembly, and as the authority for electing officers, such as the religio-economic manager, the *en*, and in times of crisis, a war leader, the *lugal*, who served for the time of the emergency only. This pattern made its imprint on early myths and survived as a feature of local government down into the second millennium. In the following Jemdet Nasr and Early Dynastic periods there are suggestions that the pattern of primitive democracy was extended from a local to a national scale with the formation of a league of the city-states along the Euphrates, which met for assembly in Nippur. What specific circumstances could have induced these city-states to forget their local rivalries and join in a common effort is not known for certain, but a plausible guess would be that pressure from invading Akkadian-speaking nomads from the west, which should date to about this time, would have constituted a danger clear and present enough to impose unity, at least for a while.

Whatever unity may have been imposed by the common need to stem the Akkadian advance can have been of short duration only. The Early Dynastic period quickly became one of wars between city-states, which vied with one another for hegemony over the country. The first city to achieve such status was Kish in the north, and its rulers maintained that status long enough to make the title “king of Kish” a term for overlordship over all of Sumer and Akkad. After Kish, various other cities, prominent among them Uruk and Ur, held the hegemony for shorter periods, always precariously and open to successful challenge.

The warlike conditions of life made their mark on the kind of political leadership that had evolved, that of the *en* and the *lugal*. The *en* was basically a person who produced abundance. He or she participated as spouse of the city deity in the yearly fertility drama of the Sacred Marriage, and generally, through personal charisma, managed city affairs productively. One might speak of a “priest-king” or “priest-queen.” The *lugal* was quite different. The term means “great householder,” not “great man,” as it is generally translated, and the *lugal* was originally the son of a major landowner, chosen in the assembly for his military prowess and for the house servants of his paternal house, who would form the core of the army and its high command. As times grew more warlike—and evidence for war appears already with the late Uruk period—the *en*, if he wished to retain his leadership, was forced to turn his abilities to military leadership also, while the *lugal*, who originally had been chosen for the term of an emergency, tended to become permanent as the threat of war became so. This imposed on him responsibility also

for the religious, administrative, and economic tasks that belonged originally to the *en*, so that the functions of the two offices tended to merge. The old title of *en* was continued in Uruk. Almost everywhere else that of *lugal* was preferred. A new title of rather more restricted claim, which made its appearance in the Early Dynastic period, was that of *ensi*, “productive manager of the arable lands.” It designated the official in charge of plowing, and thus of the city’s draft animals, which in war would serve the chariotry of its army. The *ensi*, therefore, tended to become the political head of the community, its ruler.

At the very end of the Early Dynastic period a ruler of the city of Umma succeeded in extending his domain to include all of Sumer and Akkad. After an unsuccessful campaign in the north he was defeated and his realm taken over by Sargon of Akkad (c. 2334–2279). Sargon’s successors kept a precarious hold on the south until, at the accession of Naram-Sin (c. 2254–2218), that region made itself independent. Akkad continued to flourish, however, deriving its wealth from its position on the major overland route from the Mediterranean to Iran and India, a route the Akkad rulers carefully policed. The city’s wealth may have been the cause of an attack on it by a coalition of neighboring countries. Naram-Sin met their armies one by one and defeated them, thus regaining control of all of Mesopotamia. This feat so awed his fellow citizens that they deified him and chose him city god of Akkad. Under Naram-Sin’s successors Akkad went into decline, and the Gutians, invaders from the eastern mountains, for a while took control. They were defeated, and the country liberated, by Utuhegal of Uruk, who in turn was succeeded by the famous third dynasty of Ur. Under that dynasty a well-integrated administrative system was developed. The formerly independent city rulers now became governors appointed by, and responsible to, the king and his corps of central officials.

The third dynasty of Ur ended in disaster. A breakthrough of Mardu tribes, nomads of the western desert, disrupted communications and isolated the former city-states from the capital, Ur, which lost control of all but the immediately adjacent territory. Eventually the city fell to an invading force from Elam and was mercilessly looted. Its fall spelled the end of Sumerian civilization even though the language, as the vehicle of culture and learning, continued to be taught in the schools.

The third dynasty of Ur was followed by two long-lived dynasties, one of Isin and one of Larsa, which divided the country between them. They in turn gave way to the short-lived rule of all of Babylonia by Hammurabi of Babylon (fl. 1792–1750), famous for his law code, and his son Samsuiluna. Late in the latter’s reign the south and middle of Babylonia again made itself independent, now under the name of the Sea Land. It covered much the same territory as had Sumer, and its kings consciously stressed their role as heirs to Sumer’s ancient language and culture. The dynasty of Babylon fell to a raid by the faraway Hittites around 1600

BCE. When the Hittites had withdrawn, invaders from the mountains, the Kassites, took control and ruled Babylonia for a substantial length of time. One of these Kassite kings, Ulamburiash, conquered the Sea Land and thus unified Babylonia once more. The major rivals of the Kassite kings were the rulers of Assyria, which since the time of Hammurabi had grown in power and influence.

The Kassite dynasty fell before an attack by Shutruk-Nahunte of Elam, who controlled the country for a while. Then a move to regain independence developed in Isin, and the energetic ruler Nebuchadrezzar I (1124–1103) completely liberated the country, defeated Elam, and brought back the statue of Marduk, the city god of Babylon, which the Elamites had earlier taken as booty. From this time on begins the rise of that god to a position of supreme power in, and creator of, the cosmos. Before then the traditional view with Enlil as supreme god had held sway as the officially accepted one.

The following centuries saw a steady rivalry between Babylonia and Assyria, with the latter eventually victorious. After a gradual extension of their authority over Syria by the Assyrians, Tiglath-pileser III (745–727) conquered Babylonia, and under his successors, Sargon II, Sennacherib, Esarhaddon, and Ashurbanipal, it remained an Assyrian dependency even though at times it had its own Assyrian-appointed king and a semblance of independence. Throughout this time, however, Babylonia remained a thorn in the side of its Assyrian overlords. It even drove Sennacherib to the extreme of obliterating the city, only to have it restored by his son Esarhaddon.

Assyria fell in 609 BCE, after the capital, Nineveh, had been captured in 612 in a combined attack by the Medes and the army of Babylonia. Here an Aramean, Nabopolassar, had achieved freedom from the Assyrian yoke and founded a dynasty. After participating with the Medes in the destruction of Nineveh and Assyria, he turned to the conquest of Syria, which was accomplished by the crown prince Nebuchadrezzar, who followed his father to the throne in 605.

In 539 BCE Babylon opened its gates to the Persian king Cyrus. The last indigenous ruler, Nabonidus, had incurred the hatred of the Marduk priesthood through his championship of the moon god Sin of Harran and his attempts at religious reform. For part of his reign he left rule in Babylon to his son Belshazzar and withdrew himself to the Tema Oasis in Arabia. With him ended Babylonian independence.

DIVINE FORMS: THE NUMINOUS. Basic to all religion, and so also to ancient Mesopotamian religion, is, I believe, a unique experience of confrontation with power not of this world. The German theologian and philosopher Rudolf Otto called it the numinous experience and characterized it as experience of a *mysterium tremendum et fascinans*, a confrontation with a “wholly other” outside of normal experience and indescribable in its terms. It is the human response to it in thought (myth and theology) and action (cult and worship) that constitutes religion.

Since what is met with in the numinous experience is not of this world, it cannot be described, for all descriptive terms necessarily reflect this-worldly experience and so fall short. At most, therefore, it will be possible to seek to recall and suggest the human response to the numinous experience as closely as possible by way of analogy and evocative metaphor. Every religion, accordingly, has evolved standardized versions of such metaphors. They form the link from firsthand to secondhand experience, become the vehicle of religious instruction, and form the body of collective belief. They will differ, naturally, with the different civilizations in which they are grounded and from which their imagery is taken. Study of any given religion must thus begin with the study of its favorite and central metaphors, taking due care not to forget that they are but metaphors and so are no end in themselves but are meant to point beyond.

Physiomorphy. Turning, then, to the world of ancient Mesopotamian religion, its most striking characteristic seems to be an innate bend toward immanence. The numinous was here experienced as the inwardness of some striking feature or phenomenon of the situation in which it was encountered, as a will and power for that phenomenon to be in its particular form and manner and to thrive. It was therefore natural that it should be considered to have the form and name of the phenomenon whose inwardness it constituted. It was also natural that the early settlers should have been drawn particularly to those numinous forces that informed phenomena vital to their survival, the early economies, and that they should have wished to hold onto them and maintain them through cult and worship.

The original identity of numinous powers with the phenomena they were thought to inform is indicated by divine names such as *An* ("heaven") for the god of heaven, *Hursag* ("foothills") for the goddess of the near ranges, *Nanna* ("moon") for the moon god, *Utu* ("sun") for the sun god, *Ezen* ("grain") for the grain goddess, and so forth. Occasionally an honorific epithet, such as *en* ("productive manager, lord") or *nin* ("mistress"), was added, as in *Enlil* ("lord wind") and *Nintur* ("mistress birth-hut"). In some cases the mythopoeic imagination elaborated on a phenomenon to bring out its character more vividly, as when the numinous thundercloud *Imdugud* ("rain cloud") takes form as an enormous bird floating on outstretched wings and emitting its thunderous roar through a lion's head, or when *Gishzida* ("wellgrown tree") is given form as the stock of a tree entangled in roots having the form of snakes, thus visualizing the belief of the ancients that tree roots could come alive as snakes.

The early selectivity of powers experienced in phenomena of vital economic importance to the settlers shows in the distribution of city gods, who must be considered coeval with their cities, over the various regional economies of the country. The extreme south is marshland with characteristic economies such as fishing, fowling, and hunting. Here was *Eridu*, the city of *Enki*, whose other names were *Daradim*

("wild goat fashioner") and *Enuru* ("lord reed-bundle"), signifying power in the marsh vegetation and in the reed bundles with which reed huts were constructed. Farther east, in *Nina*, resided *Enki's* daughter *Nanshe*, goddess of fish, the numinous force producing the teeming schools of fish that gave the fisherman his livelihood. South of *Nina*, in *Kinirsha*, was the home of *Dumuzi-Abzu* ("producer of healthy young ones of the marsh"), the mysterious numinous will and power for the young of marsh fauna to be born healthy and unimpaired. Through the marshlands along the *Euphrates* runs also the country of the ox herdsman and the orchardman. To the ox herdsman's pantheon belonged the bull god *Ningublaga* and his consort *Nineiagara* ("lady of the creamery"). In *Ur* resided *Nanna*, the moon god envisaged by the herdsman as a frisky young bull with gleaming horns—the new moon—grazing in the pasture of heaven. In *Ararma*, farther up river, resided the sun god *Utu*, whose round face was seen as the round face of a bison. At *Uruk*, finally, was the cow goddess *Ninsuna* ("mistress of the wild cows"), who was herself visualized as cow-shaped, and her bull-god husband, *Lugalbanda*. The ox herdsman grazed their herds on the young shoots of reed and rushes in the marshes along the *Euphrates*. Closer to the river itself was the country of the orchardmen, who depended on the river for the irrigation of their plantations. To them belonged *Ninazu* of *Enekir*, seemingly a god of waters, and his son *Ningishzida* ("master of the good tree") of *Gishbanda*, a deity of tree roots and serpents. His wife was *Ninazimua* ("mistress of the well-grown branch"). *Damu*, city god of *Girsu* on the *Euphrates*, was a vegetation god, especially, it would seem, the power for the sap to rise in plants and trees in the spring. Farther up still, at *Uruk*—in antiquity as today a center of date culture—there was *Amaushumgalana*, the power for animal growth and new life of the date palm, and his consort *Inanna*, earlier *Ninana* ("mistress of the date clusters"), a personification of the date storehouse.

At *Uruk* the country of the orchardmen and the oxherds joins that of the shepherds; called the *edin*, it is a wide, grassy steppe in the heart of Sumer, ringed around by the *Euphrates* and the *Iturungal*. Here on the western edge is *Uruk* with *Inanna* of the shepherds, goddess of the rains that call up verdure and grazing in the desert, and her young husband, *Dumuzi* ("producer of healthy young ones"). This pair was also worshiped in *Patibira* on the southern edge, and in *Umma* and *Zabalam* on the eastern edge. On the southern edge lies also *Ararma* with the sun god *Utu* and his son *Shakan*, god of all four-legged beasts of the desert, and to the north is the domain of *Ishkur*, god of the thundershowers that turn the desert green like a garden in the spring.

North and east of the *edin*, finally, lay the plowlands with cities dedicated to cereal and chthonic deities, or deities of the chief agricultural implements, the hoe and plow. *Shuruppak* on the *Euphrates* was the home of *Ansud*, goddess of the ear of grain and daughter of *Ninshebargunu* ("mistress mottled barley"). Farther up the river was *Nippur* with

Ansud's divine husband, Enlil; and since Enlil's winds were the moist winds of spring that made the soil workable, he also was god of the oldest and most versatile agricultural implement, the hoe. Nippur—the city rather than its sacred quarter around Enlil's temple, Ekur—was also the home of Enlil's son Ninurta (“master plow”), god of the younger implement, the plow, and charged in Nippur with the office of plowman (*ensi*) on his father's estate. Identified by the ancients with Ninurta were the gods Pabilsag (“first new shoot”), who in Isin was husband of the city goddess Nininsina (“mistress of Isin”); and Ningirsu (“master of [the city] Girsu”), who in Girsu, southeast of the *edin*, was essentially a god of the thundershowers and the floods of spring. Farther north, in Cutha, resided the netherworld gods Meslamtaea (“the one issuing from the luxuriant mesu tree”)—presumably originally a tree deity—and Nergal. In Kish resided Sabbaba (“ever spreading the wings”), a god of war and originally, perhaps, of the thundercloud. In Babylon Mero-dakh, or Marduk (“calf of the storm”), was the city god. He was a god of the thunderstorm envisaged as a roaring young bull.

Anthropomorphism. It seems reasonable to consider the physiomorphic forms the original and oldest forms under which the gods were envisaged, yet one should probably not altogether exclude the possibility that the human form may be almost equally early. The two forms were not mutually exclusive, and a deity might well choose to appear now under one, now under another. Seal impressions from the late Uruk period show the ritual scene of the sacred marriage with the goddess Inanna in her physiomorphic form of storehouse gateposts on some, in her human form on others. A later example is a statement about Gudea, ruler of Lagash (fl. c. 2144–c. 2124 BCE), who lived shortly before the third dynasty of Ur and whose goddess mother was the cow goddess Ninsuna. He is said to have been “born of a good cow in its woman aspect.” As late as the early first millennium, a hymn to the moon god revels in attributing to the god physiomorphic and anthropomorphic forms alike: he is a prince, a young bull, a fruit selfgrown, a womb giving birth to all, and a merciful, forgiving father.

Although human and nonhuman forms thus could co-exist peacefully, there are indications that they were not always equally favored. The human form was clearly seen as more dignified and appropriate than the nonhuman one and tended to eclipse it.

One outcome of this attitude was representations in which the two different kinds of form were blended but with the human features dominant. In Girsu, for instance, at the end of the Third Early Dynastic period a mace head dedicated to Ningirsu, god of thundershowers and floods, shows the donor in a pose of adoration before the god in his old form of a thunderbird. Somewhat later, when Gudea saw the god in his dream, Ningirsu was essentially human in form although he retained the thunderbird wings and merged the lower part of his body with a flood. From the time of Gudea

stems also a vase dedicated to Ningishzida that shows the god in his cella with the door open and flanked by two gatekeepers in dragon form. The god appears in his original form of the stock of a tree entwined by serpent-shaped roots. To this same period belongs a relief that shows Ningishzida introducing Gudea to Ningirsu. Here he is in completely human form except for two heads of serpents peeping out from his body at the shoulders. In much similar fashion, vegetation deities on seals are shown with branches and greens protruding from their bodies as if—in the words of the archaeologist Henri Frankfort—their inner being was seeking to burst asunder the imposed human form.

Composite forms such as the above still recognize the relevance of the nonhuman forms and preserve their essential characteristics even if the human form clearly dominates; but more radical trends away from the physiomorphic representation deliberately separated the deity from the phenomenon which he or she informed. The deity became a power in human shape; the phenomenon subsided into a mere thing owned or managed by the deity, and the form derived from it into a mere emblem.

Thus, for instance, the goddess Hursag (“foothills”) ceased being the deified foothills themselves and became instead Ninhursaga (“mistress of the foothills”). Similarly, the deified wild cow became Ninsuna (“mistress of wild cows”). Gishzida (“good tree”) turned into Ningishzida (“master of the good tree”). Ningirsu's form of thunderbird was referred to by Gudea as his emblem, and it adorns—and perhaps protects—Ninurta's war chariot on the famous Stela of the Vultures. Inanna, as goddess of the morning and evening star, had the physiomorphic form of the small, round disk which that star looks like in the Near East. That too became an emblem carried as a standard by the contingent from her clan when Gudea called it up for work on the temple he was building.

As so often with religious beliefs, so also here: no change is ever a clean break. Although demoted to emblems, the old forms did not altogether lose their potency. It is in these forms, as standards, that the gods followed the army in war and gave victory, and it is in these forms that the gods sanctioned oaths. Oaths were taken by touching them.

At times the aversion felt for the older, nonhuman forms must have been intense enough to engender open enmity. This seems to have been the case with the thunderbird, which from being Ningirsu's early shape became first a mere emblem of his and then was listed by editors of the myth about him, called *Angim*, among the god's captured enemies pulling his triumphal chariot. In still later time the bird—often shown as a winged lion rather than as a lion-headed bird—even became the god's chief antagonist. Thus in the Akkadian myth of Anzu (the Akkadian name of the bird) the god victoriously routs and subdues his own former self. A pictorial representation of the battle graced his temple in Nimrud. In these later materials Ningirsu is called by the

name of Ninurta, the god of Nippur with whom he was early identified.

Sociomorphism. Man is a social being: he exists in a context of family and society generally, so in attributing to the gods human form the ancients almost unavoidably attributed to them also social role and status. One such basic context implied in the human form was that of family and household. In the case of major deities the household could be sizable, resembling that of a manorial lord.

The factors that determined the grouping of deities into a given divine family are not always obvious and may have been of various kinds—similarity of nature, complementarity, spatial proximity, and so forth. Similar character probably dictated the grouping of seven minor cloud goddesses as daughters of the god of thundershowers, Ningirsu. The nature of their mother, Ningirsu's wife, Baba, is less clear; she may have been a goddess of pasture. Ningirsu's son Igalima ("door leaf of the honored one") appears to be a deification of the door to Ningirsu's court of justice. Since clouds were seen to rise as mist from the marshes, the positing of the rain-cloud god Asalluhe as son of the god of the marshes, Enki, seems understandable. So too does the marriage of Amaushumgalana, the power producing the date harvest, to Inanna, the goddess of the storehouse. A logical connection seems observable also between the aspect of Enlil in which he is god of the older agricultural implement, the hoe, and that of his son Ninurta, god of the younger implement, the plow; but only too often no explanation readily suggests itself.

Our most complete picture of a major divine household is given by Gudea in the hymn known as Cylinder B. It lists the minor gods who served as functionaries in Ningirsu's house, that is, his temple, lending divine guidance to the human staff. Thus Ningirsu's oldest son Shulshagana served as majordomo, the traditional role of the eldest son. His brother Igalima functioned as chief gendarme responsible for the maintenance of law and order on the estate. Ningirsu's septuplet daughters served as his handmaidens and also presented petitions to him. He had two harpists—one for hymns, one for elegies—and a chambermaid, who bathed him at night and saw to it that his bed was provided with fresh straw. For the task of administering his estate and sitting in judgment in disputes that might arise, the god had a divine counselor and a secretary (*sukal*). There were two generals, and an assherd to look after the draft animals. Goats and deer on the estate were cared for by a divine herder of deer; a divine farmer looked after the extensive agricultural holdings; a tax gatherer supervised the fisheries; and a ranger protected the wildlife of the estate against poachers. A high constable and a night watchman kept the estate safe.

In addition to their local functions of looking after their estates, most of the major deities had also wider, national responsibilities as officers of the divine polity into which the sociomorphic view was gradually transforming the cosmos. Highest authority in this divine state was a general assembly

of the gods, which met in Nippur in a corner of the forecourt of Enlil's temple, Ekur, called Ubshuukkinna. An and Enlil presided; the gods took an oath to abide by the decision of the assembly, and voted by saying "Heam" ("May it be!"). The assembly served as a court—it once even banned Enlil himself—and it elected cities and their rulers to hold sway over all of Sumer and Akkad. The election was for a term only, and when the assembly decided a term was ended, it voted to overthrow the reigning city and transfer its kingship to another city and ruler.

Besides the office of king, the divine state knew also more permanent offices. For the most part these offices, which were called *me* ("office, function"), were reinterpretations of functions already innate in the gods in question, the phenomena and processes of which they were the indwelling will and power; they were now envisaged as the official duties of members of a divine bureaucracy. A comprehensive statement of this view of the cosmos is found in the myth *Enki and the World Order*, which tells how Enki, acting on behalf of Enlil, institutes the proper course of natural phenomena and the manner of engaging in human industries, appointing in each case a divine official to be responsible for them. The regime of the Tigris and the Euphrates thus comes under the administration of the "inspector of canals," the god Enbilulu. Other officials are appointed for the marshes and the sea; the storm god Ishkur is made the official in charge of the yearly rains. For agriculture the farmer god Enkimdu and the grain goddess Ezinu are appointed; for the wildlife, the god of beasts, Shakan; for the flocks, Dumuzi, the shepherd; for just boundaries, the god of justice, Utu; for weaving, the spider goddess, Uttu; and so forth.

THE PANTHEON. A pantheon seeking to interrelate and to rank the innumerable deities the ancient Mesopotamians worshiped, or merely recognized, in cities and villages throughout the land evolved gradually through the diligent work of scribes, who produced lists of divine names as part of their general lexical endeavors. The resulting scheme as it is known to us from old Babylonian copies was based primarily on the prominence in the cosmos of the cosmic feature with which the deity in question was associated, secondarily on his or her family and household ties. It is thus anthropomorphic and sociomorphic in character. First came the deities of heaven, the winds, the eastern foothills, and the underground fresh waters, each with his or her family and household. Then followed deities of smaller entities such as the moon, the sun, and the morning and evening star. A following section dealing with deities of the Lagash region was probably not part of the original list, since that region was considered enemy territory down to the time of the third dynasty of Ur. Last came the deities of the netherworld. In its main lines, and necessarily highly selectively, the pantheon may be presented as follows (Akkadian names, when different from the Sumerian ones, are given in parentheses).

An. An (Anum) was god of the sky and father of the gods. The main center of An's cult seems to have been in

Uruk. An was given form mythopoeically as a mighty bull whose bellowing was heard in the thunder. The rain was seen as his semen impregnating the earth (*ki*) and producing vegetation. As the cloudy skies vanished with the spring, An as Gugalanna (“great bull of heaven”) was thought to have been killed and gone to the netherworld. A different tradition saw An (Anum) as the sky in its male aspect married to An (Antum), the sky in its female aspect. She, like her husband, was given bovine form and seen as a cow, whose udders, the clouds, produced the rain. An important aspect of An was his relation to the calendar, the months having their characteristic constellations that announced them. To this aspect belonged monthly and yearly festival rites dedicated to An.

Enlil. God of wind and storms, Enlil was the most prominent member of the divine assembly and executor of its decrees. The city of Enlil was Nippur (Nuffar), with his temple, Ekur. He was married to the goddess Ninlil (“lady wind”), who was also known as Ansud (“long ear of grain”). Her mother was Ninshebagunu, the barley goddess, and her father, Haya, was keeper of the seal with which the doors of Enlil’s granaries were secured. Originally in keeping with the agricultural ambience of his wife, Enlil would seem to have been the power in and for the moist winds of spring that soften the hard crust on the soil and make it tillable. Thus he was also god of the oldest tool of tillage, the hoe. With the hoe, after he had invented it, he broke—according to one myth—the hard crust on the earth at Uzumua (“flesh-grower”), in Nippur, so that mankind could shoot up like plants from the earth.

Two quite different myths deal with the wooing of Ninlil or Ansud by Enlil. In one he follows successfully established procedures for winning her. In the other, more primitive one, Ninlil, disregarding her mother’s instructions, deliberately tempts Enlil to take her by force by bathing in the canal of the town. Enlil is then banished from the city by the assembly of gods for his misdeed and leaves for the netherworld. Ninlil, pregnant with the moon god Suen (Sin), follows him. On the road Enlil, posing successively as gatekeeper of Nippur, man of the river of the netherworld, and ferryman, persuades her to lie with him that she may conceive a further child, who may take Suen’s place in the netherworld. Thus Suen’s netherworld brothers, Meslamtaea, Ninazu, and Ennugi, are engendered. The myth ends—oddly to a modern reader—with a paean to Enlil as a source of fertility: “A lord of great consequence, a lord of the storehouse are you! A lord making the barley grow up, lord making the vines grow up are you! Lord of heaven, lord of abundance, lord of earth are you!”

The aspect of Enlil in which he was the benevolent provider of abundance is clearly an old one, and it was never lost sight of. With time, however, his character took on also more grim features. As leader of the divine assembly and executor of its decrees, he became the power for destruction of temples and cities, the all-obliterating storm with which the assembly overthrew dynasties and their capitals as it shaped history.

This later aspect of Enlil is prominent in laments, where more and more the will of the assembly becomes subsumed in his will, and it is for him alone to relent and to restore what he had destroyed. In the first millennium, as Marduk of Babylon rose to preeminence, Enlil, as representative of the often-rebellious south, even came to be treated as enemy and evil in northern Babylonia, as is clear from his role in ritual texts; or he was totally ignored, as in the late creation epic *Enuma elish*, which celebrates Marduk as the creator and ruler of the cosmos.

Besides the tradition which had Ninlil or Ansud as consort of Enlil, there existed a variant one in which he was paired with the goddess Ninhursaga, the older Hursag (“foothills”). Here probably also belongs an aspect of Enlil in which he was seen as a mountain deity, his name in that capacity being Kurgal (“great mountain”) and that of his main temple, Ekur (“mountain house”). The connection between this mountain aspect and his aspect as god of the wind appears to correlate with the fact that the ancients believed the home of the winds to be in the mountains. Enlil would thus originally have been specifically the east wind, *imkura* (“wind of the mountains”).

On Ninhursaga, Enlil begat the seasons of the year, Winter and Summer, and he also fathered the god of the yearly flood of the Tigris, Ningirsu. In the form the myth of the latter takes in Gudea’s references to it, Ningirsu is the semen of Enlil reddened in the deflowering. This may be taken to refer to the waters of the melting snow in the high mountains in Iran (Enlil as Kurgal) in the spring. The waters make their way through the foothills (*hursag*), where the clay they absorb gives them a reddish hue, to pour into the Tigris, swelling it to flood, Ningirsu.

Ninurta. In Nippur, the town itself—as distinct from the sacred area around Ekur—had as city god a son of Enlil called Ninurta, whose wife was the goddess Nin-Nibru (“queen of Nippur”). Ninurta’s name may be interpreted as containing a cultural loanword, *urta* (“plow”), thus identifying him as god of that implement, much as his father, Enlil, in one aspect was god of the older agricultural tool, the hoe. Ninurta held in Nippur the office of plowman (*ensi*) for Ekur, and at his yearly festival the king opened the plowing season behind a ceremonial plow. Ninurta was early identified with Ningirsu of Girsu, and myths pertaining to the latter were freely attributed to him, so that it often is difficult to determine which traits are original to whom.

A clear case is that of the myth *Lugale*, which can be shown to belong originally to Ningirsu. It depicts the god as a young warrior king who learns that a rival has arisen in the mountains and plots to kill him. He sets out with his army for a preemptive strike, attacks impetuously, and faces disaster, but is saved by advice from his father to send out a heavy rain, which lays the dust that his adversary, one Azag, had raised against him, nearly suffocating him. He then succeeds in killing Azag and goes on to organize the regime of the Tigris, bringing its waters down for irrigation. Before

that they had flowed into the mountains, where they froze. To hold the waters on their new course, Ningirsu constructs a barrier of stone, the foothills (*hursag*), and when his mother comes to visit he presents it to her as a gift, renaming her Ninhursaga (“mistress of the foothills”). Last he sits in judgment over Azag’s warriors, various kinds of stones that he had captured, and imposes rewards or punishment according to their conduct in the war. His judgments determine the nature and the distinguishing traits of the stones in question for all time. He finally returns victoriously home.

To Ningirsu probably also belongs the myth *Angim* (mentioned above), which describes the god’s victorious return from war and how he has to tone down his boisterous behavior lest he upset his father, Enlil. The basis for the tale would seem to be a spell for averting thunderstorms—Ningirsu was god of the thunderstorm—from Nippur. Conceivably a hymn praising Ninurta in his relation to various stones could be in origin Ningirsu material.

So perhaps also is a myth telling how the thunderbird stole the tablets of destiny from Enki in Eridu, how Ninurta set out to recover them, intending to keep them for himself, and how, when his weapon stunned the bird, it let go its hold of the tablets, and they of themselves returned to Enki. Frustrated in his ambition, Ninurta then raised a flood against Eridu, but Enki craftily had a turtle dig a pit, and he lured Ninurta into it. Underlying the myth is apparently a concept of the rain cloud rising as mist from the swamps, Enki’s underground waters (*apsu*), and, moving in over the mountains, the flight of the thunderbird. The return of the waters in the flood is seen as the god’s jealous attack on Enki, and his imprisonment in the turtle’s pit must stand for the eventual dwindling of the flood to a trickle between towering banks, the pit.

Nusku. To Enlil’s household belonged Nusku, in origin a god of lamps. He served as Enlil’s trusted vizier and confidant.

Ninhursaga. Ninhursaga (“mistress of the foothills”), earlier simply Hursag (“foothills”), was the power in the fertile near slopes of the eastern mountains, the favorite grazing grounds in the spring. Her cities were Kesh, not yet identified, and Adab, the modern mound Bismaya. In addition to the name *Ninhursaga*, the goddess was also known as *Ninmah* (“august mistress”), *Dingirmah* (“august deity”), and *Nintur* (“mistress birth-hut”), her name as goddess of birth. Her Akkadian name was *Beletili* (“mistress of the gods”). She, An, and Enlil formed in the third millennium the ruling triad of cosmic powers.

Enki. Enki (Ea) was god of the underground fresh waters that come to the surface in rivers, pools, and marshes. The Sumerians imagined them as a vast subterranean freshwater sea, which they called Abzu or Engur. Enki’s city was Eridu (Abu Shahrein), where he resided in the temple called Eengura (“house of the deep”). A myth tells how he built it and celebrated its completion with a feast for his father,

Enlil, in Nippur. Enki’s mother was the goddess Namma, whom the scribes listed as Enlil’s housekeeper. Other evidence suggests that she was the deified riverbed that gave birth to the god of the river, Enki. Her name seems to mean “mistress vulva,” and it may be that the mythopoeic imagination of the ancients saw the chasm of the empty riverbed as the vulva of the earth. Enki’s spouse was called Damgalnunna (“great spouse of the prince”), a name that tells us little about her. Enki’s vizier was a Janus-faced god, Sha (Usmu).

The name *Enki* means “productive manager [lord] of the soil,” which must seem highly appropriate for the god of river waters in a society dependent on irrigation agriculture. In a hymn he describes himself in this aspect, saying: “When I draw near unto heaven, the rains of abundance rain down; when I draw near unto the earth, the early flood at its height comes into being; when I draw near unto the yellowing fields, grain piles are heaped at my command.” Water not only slakes the thirst of men, animals, and plants, it also serves to cleanse. In that aspect, as power to cleanse, Enki appears in rituals of purification from all that defiles, including evil spirits attacking man, causing disease and uncleanness. One such elaborate ritual, meant to purify the king of possible evil caused by an eclipse, has the form of a trial before the sun god in which Enki sends a messenger, the exorcist, to speak for the claimant, the polluted king, and undertakes to enforce the verdict. This he does by washing all evil away with his water. The ritual is called Bitrimki (“bathhouse”). In other rituals Enki provided the effective incantation and prescribed cleaning and healing acts, and it is not too much to say that he occupied a central position in all white magic for combating demons of illness.

Since Enki always knew what to do to drive away demons, he generally rated as the most resourceful and ingenious of the gods. He was skilled in every craft, and under different names he served as patron deity for most of them. His practical ingenuity also made him a born organizer. He was the one who organized the cosmos for Enlil in the myth *Enki and the World Order*, discussed above. Enki in the myths told about him never uses force; instead he gains his point by cunning deftly exercised. An example is the story of Adapa, the steward of Enki, or rather of Ea, for the text uses his Akkadian name. When Adapa once was summoned to appear before Anu in heaven for having broken the wing of the south wind, Ea told him how to gain the goodwill of the two gods who guarded the gate so that they would intercede for him. Ea also warned him not to eat and not to drink, for he would be offered the bread of death and the water of death. All went as planned, and Anu was appeased by the intercession of the doormen. When Adapa refused food and drink, however, Anu was surprised and asked why. Adapa told him, and Anu burst into laughter. The food and drink would actually have made Adapa immortal, which Ea knew and did not want to happen.

A rather more momentous occasion on which Enki showed his cunning was when he saved the human race from

destruction at the hand of Enlil. We are told about it in the Sumerian story of the flood, which forms part of the myth called the *Eridu Genesis*. Mankind, having been created and provided with leadership—in the form of kings—by the gods, prospered and proliferated, to the extent that the noise they made became so irksome to Enlil that he persuaded the assembly of the gods to wipe out man with a universal flood. Enki, who was present, was able to warn the pious King Ziusudra to build an ark. Ziusudra followed the advice and was eventually accepted among the gods and granted eternal life as reward for saving all living things.

A far more detailed—and conceivably more original—version of this story is found in the Akkadian tale of Atrahasis (“the surpassingly wise”), who here takes the place of Ziusudra. The story falls into two halves, each clearly originally a separate tale. The first half tells how in the beginning the gods themselves had to work for their food, digging the needed irrigation canals. They eventually rebelled, and Ea thought of the solution, creating man to do the hard work. To that end a god was killed and his blood mixed into the clay from which man was to take form. The mother goddess gave birth to him, and there was general rejoicing. The second half tells how mankind proliferated on earth and with their noise kept Enlil from going to sleep. Enlil therefore tried to cut down on man’s numbers by a succession of diseases and famines, but each time Ea found ways of stopping the evils before it was too late, and soon man again proliferated as before. Finally Enlil decided on a desperate means: wiping out mankind with a flood. Again Ea frustrated the plan, by having Atrahasis build an ark in which he survived with his family and the animals. As he emerged from the ark he offered a sacrifice, and the gods were delighted, for all through the flood, with no humans to offer sacrifice, they had suffered severely from hunger. Only Enlil was wroth, but him Ea appeased by instituting plans for population control: barrenness, child disease, and so forth. Thus harmony in the universe was reestablished. As given in the tale of Atrahasis, the story of the flood is the most detailed we have. A shorter version—shorn of any motivation for the flood—was added to the *Epic of Gilgamesh* by the later editor Sinliqiunnini. In the story of Adapa, Enki used his ingenuity against Anu; in the flood story, against Enlil.

A third myth, *Enki and Ninmah*, pits Enki against the third in the triad of highest deities, Ninhursaga, whom the myth calls Ninmah. Like the Atrahasis story, this composition consists of two separate myths only very loosely connected. The first of these is a Sumerian counterpart to the first part of the Atrahasis story, where the refusal of the gods to work had Enki propose the creation of man. Here he is fathered by “the engendering clay of Abzu,” which once also fathered Enki, and he is given form and is borne by Enki’s mother, Namma. The second myth begins with a party given by Enki to celebrate the birth of man. As he and Ninmah, who had assisted Namma as birth helper, drink deeply, Ninmah begins to boast that she controls men’s fortunes, deter-

mining whether they will be good or bad. (That makes little sense if she was, as here, a mere midwife. Apparently, in the original myth underlying this part of the composition she was, as in the Atrahasis story, the one who gave shape to the embryo of man and bore it as an infant.) Enki accepts her challenge, vowing that he can counter anything she can think up. She then creates a series of misshapen or otherwise defective human beings, but for each one Enki is able to think of a place in society where it can function and support itself. When Ninmah finally gives up, Enki proposes that he try his hand and that she find a place for his creature. He then fashions an embryo and has it given premature birth by a woman provided by Ninmah. There is nothing Ninmah can do for it, and she breaks out in lament. Enki, however, calms her with a conciliatory speech, pointing out that it is precisely her contribution, the maturing of the embryo in the womb, that it lacked. The man’s contribution to the engendering of a child is not enough by itself; the woman’s is needed too. And so he praises her powers.

The question thus raised, of the respective share of the male and the female partner in procreation, seems to have been variously answered at different times. The first part of *Enki and Ninmah* gives the woman all the credit. Man was engendered from clay, formed, and given birth—as it specifically states—without a male being involved. Somewhat similarly, the tale of Atrahasis has man created from clay and divine blood and formed and given birth by Nintur, that is, by Ninmah. Enki’s contribution in both cases was chiefly the idea of making man. In the second part of *Enki and Ninmah*, however, this changes. Enki’s power to create an embryo, although not to mature it and give it birth, is stressed; and finally, in the account of the creation of man in *Enuma elish* at the turn of the first millennium, the birth goddess has vanished, and Enki does the creation all by himself.

One final odd composition with Enki as its hero remains to be mentioned, *Enki and Ninhursaga*. It begins with praise of the island of Dilmun (modern Bah-rain) and its pristine purity at the beginning of time. It then tells how Enki provided it with fresh water and made it a port and an emporium. Next we hear how Enki attempts to seduce Ninhursaga but is rejected until he proposes marriage, making her his wife. She gives birth to a daughter, whom Enki seduces as soon as she becomes nubile, fathering a second daughter, whom in turn he seduces and makes pregnant. Her daughter, Enki’s granddaughter, is Uttu, the spider goddess, and Ninhursaga warns her against Enki. Uttu therefore refuses to let him into the house unless he brings wedding gifts of fruits. He does so, and when Uttu lets him in, he takes her by force. Uttu’s screams bring Ninhursaga, who removes Enki’s semen and sows it. From it eight plants grow up. Later, passing by, Enki notes the plants, and as his vizier gives them names, Enki eats them. Ninhursaga, discovering what has happened, vows never to look upon him with her life-giving eye. The plants, Enki’s semen, which he swallowed, then begin to develop as embryos in his body. Being male,

he is unable to give birth to them, and so falls critically ill. The gods are greatly distressed, but the Fox offers to bring Ninhursaga. It does so; she is released from her vow, places Enki in her vulva, and successfully gives birth to eight deities, who are named and given status, their names serving as grotesque puns on the words for the part of Enki's body from which they come. The last is the goddess of Dilmun.

The stress on Dilmun, and on Enki's amorous success with his daughter, granddaughter, and, in one version, great-granddaughter, the "comely spider goddess Uttu," is hardly meant to be taken seriously. Presumably, the earthy humor of the composition was intended to amuse visiting sailors from Dilmun when they were entertained at the court of Ur.

Asalluhe. Asalluhe ("man-drenching Asar"), city god of Kuar, near Eridu, and god of rain clouds, was Enki's son. He appears predominantly in incantations against all kinds of evil doings. Floating as a cloud above the earth, he was in a position to observe what was going on below and duly reported it to his father, Enki, who was not in a similar, favorable position to observe. On hearing Asalluhe's account, however, out of his profound knowledge he was able in each case to tell how the evil was to be countered. Identified with Asalluhe in later times was Marduk.

Marduk. Marduk, or preferably Merodakh, city god of Babylon, was an old Sumerian deity who, like Ninazu in Eshnunna (discussed below) and Meslamtaea in Cutha, was taken over by the Akkadian invaders. His name, abbreviated from (*A*)*marudak* ("calf of the storm"), characterizes him as a god of thunderstorms visualized as a bellowing young bull. The thundershowers of spring mark the appearance of verdure in the desert and of plowing and sowing; thus Marduk's chief festival, the Akiti (Akitu), or "time of the earth reviving," was further described as "of the seed plowing." His city was Kadingira ("gate of the god"), translated into Akkadian as Babilim. The name indicates a settlement grown up at the entrance to a sanctuary, presumably Marduk's temple Esagila ("house with head held high"). Throughout the third and second millennia, it would seem, Marduk's status was little more than that of a local city god. With the advent of the first millennium, however, began his rise to supreme god of the universe and his rivalry for that honor with Ashur of Assyria.

Marduk's claim to supremacy was celebrated in the creation epic *Enuma elish*, in which he is presented as savior of the gods and creator and organizer of the cosmos. The myth begins by tracing world origins from a watery chaos of fresh waters, Apsu, and salt waters, Tiamat, the sea. From them stemmed various generations of gods: Lahmu and Lahamu; Anshar and Kishar, the horizon; Anu, heaven; and Nudimmud or Ea. The younger gods, getting together to dance, proved disturbing to the older generations, who prized peace and quiet. Tiamat, as a long-suffering mother, bore with it, but Apsu decided to get rid of the troublemakers. However, before he could carry out his evil design he was overcome and slain by Ea, who then built for himself a house on top of

Apsu's body. There Ea engendered his son Marduk. Anu, inordinately fond of his grandchild, fashioned the four winds for little Marduk to play with. The winds disturbed the still surface of the sea, creating billows. This greatly vexed the older gods, and they were able to rouse Tiamat to action. An army was assembled to destroy the younger gods and was placed under the command of Tiamat's paramour Kingu. The threat to the gods was serious and caused consternation among them. Both Ea and Anu, who were sent to cope with the crisis one after the other, failed and turned back. Finally, since the gods were in deepest despair, Ea suggested to the leader of the gods, Anshar, that Marduk be summoned to champion the gods. Marduk came and was willing to undertake the task, but he demanded full authority. The gods agreed, gave him the power for his word to come true, and made sure by a test that his word now had that effect. Marduk then rode to battle on his storm chariot. The sight of him overwhelmed the enemy; only Tiamat dared face him, but after an angry exchange of words, as she opened her maw to swallow him, he drove in the winds and then killed her with an arrow. Her army he took captive, enclosing it in a net held by the four winds. Out of the carcass of Tiamat Marduk then created the extant universe. He split her in two, and made out of one part heaven; out of the other, earth. To prevent her waters from escaping he provided bolts and guards. In heaven, directly opposite Ea's Apsu, he built his own house, Esharra, which the text says was the sky. He then fashioned the constellations, organized the calendar, fixed the polestar, and gave the moon and sun orders about their motion.

When Marduk returned home, he was hailed by the gods, who reaffirmed their allegiance to him. His first demand of them, then, was that they build him a city, to be called Babylon. He then pardoned the captive gods, who gratefully hailed him as king and savior and promised to build his city for him. Their willingness moved Marduk to think of a means of lightening their labors, and he decided to create man. An assembly was called. Kingu was denounced as the instigator of the rebellion and was slain, and out of his body Ea fashioned man. Marduk then divided the gods into two groups, one celestial and one terrestrial. The gods for the last time took spade in hand and built the city Marduk wanted, Babylon. At a great housewarming party to celebrate the completion of Babylon, Marduk was appointed permanent king of the gods. The myth ends with the gods naming Marduk's fifty names, each of which expressed a power that he held. Marduk's consort was the goddess Sarpantum; his son, the god of Borsippa near Babylon, was Nabu, god of the scribal art.

Nanna. Nanna (also Suen or Sin) was the god of the moon. His city was Ur (Muqayyir); his temple there, Egishnugal. His wife was Ningal. His own name, *Nanna*, would seem to designate him as the full moon, while *Suen* would be the name of the sickle moon. He was regularly envisioned in a bull shape, an image that the hornlike shape of the sickle

moon may have encouraged. He was also visualized as a herder driving his herd—the stars—across the pastures of heaven, or as riding in the heavens in a boat, the sickle moon. A late myth—actually an incantation to ward off the evils of an eclipse of the moon—tells how he was attacked by storm demons after they had lured the storm god, Ishkur, and Inanna, who aspired to queenship of heaven, to their side. The attack was noted, however, by Enlil, who alerted Enki and had him send Marduk to the rescue.

Utu. The god of the sun and of justice and fair dealings was Utu (Shamash). His cities were Ararma (Larsa) in the south and Sippar in the north. His temple in both cities was called Ebabbar; his wife was Ninkurra (Aya). As judge, Utu presided each day in various temples at specific places called “the place of Utu.” He was greeted in the morning as he rose on the horizon, heard cases all day, and was sped on his way in the evening, at sundown. During the night he sat in judgment in the netherworld. The cases he heard, whether by day or by night, were apparently normally such as were brought by the living against ghosts and demons that plagued them.

Ishkur. Ishkur (Adad) was the god of rains and thunderstorms. A text, basically a spell to avert a threatening thunderstorm from Nippur, tells him to go away so as not to disturb his father, Enlil, with his clamor. His original form seems to have been that of a bull. In many ways he resembles Ningirsu, but he seems to be more specifically a herder’s god, the power in the spring rains that bring up pasture in the desert.

Inanna. Inanna (Ishtar) was earlier called *Ninana*, which can be understood as either “mistress of the date clusters” or “mistress of heaven.” The center of her worship was, in the south, at Uruk, in the temple called Eana, and in the north at Hursagkamma, near Kish. Characteristic of her is her great complexity and many-sidedness. It is apparent that a variety of originally different deities were syncretized in her and also that the ancients had been able to blend these differences into a fascinating, many-faceted, and convincing character. Normally she was envisioned as a rather willful, high-handed, young aristocratic girl of marriageable age or else as a young bride. Her lover or husband is a form of the god Dumuzi (Tammuz). In the complex image the goddess presents it seems possible to distinguish the following aspects, presumably once independent figures.

1. As goddess of the storehouse of dates, Inanna was at home in Uruk, situated in a famous date-growing region. Her name *Ninana* here stands for “mistress of the date clusters”; the name of her temple, *Eana*, for “house of the date clusters.” Here, at the gate of the storeroom (*egida*), she received her bridegroom, Amaushumgalana (“the one great source of the date clusters”), that is, the one great bud that the date palm sprouts annually. He was the power that made the date palm produce; their wedding and his entering Inanna’s house constitute a mythopoeic view of the bringing in of the date harvest. As the rite of this marriage was performed later, the ruling king not only took the role of, but actually became, Amaushumgalana, while the goddess would have been incarnate in the queen, Ninegala (“mistress of the palace”). In the literature relating to Inanna’s wedding she is therefore often called by that epithet, and in love songs written for that occasion it is often difficult to tell whether they celebrate Inanna’s love for Amaushumgalana or perhaps rather that of the human queen for her husband. The cult of Inanna in her aspect of goddess of the date storehouse was a happy one. There was no sense of loss, no “death” of the god. The dates, eminently storable, were always with the community, and so was the power they represented.
2. Rather different was another aspect, also at home in Uruk, but in the Uruk of sheepfolds rather than of date groves. In this aspect Inanna was the power of the thunderstorms of spring, on which the shepherds depended for pasturage in the desert. In this aspect she was paired with Dumuzi, the shepherd. Her early form was apparently that of the lion-headed thunderbird, which remained with her as an attribute. Besides it, and more or less replacing it, was also the form of the lion alone.
3. Closely related to Inanna’s aspect as goddess of the thunderstorm was her aspect as goddess of war. The thunderous rumble of the primitive war chariot made it easy to see and hear thunder as the chariot’s counterpart in the sky. The ferocious nature of other forms such as lions and bulls fitted easily into the image. As goddess of war, Inanna led the Dance of Inanna, the moving of the battle lines toward each other as if they were lines of dancers. In the myths about her she subdues the in-submissive Ebeh mountain range in southern Assyria.
4. An astral aspect of both Inanna and the Akkadian Ishtar is that of goddess of the morning and evening star, with which she forms a triad with her father, the moon god, and her brother, the sun god. Her precise function in this role is not clear except insofar as her appearance marked the beginning and the end of the working day. As goddess of the morning and evening star her name was understood to mean “mistress of heaven,” and her celestial affinities conceivably also encouraged an interpretation of the name of her temple, *Eana*, as “house of heaven” and a belief that it had originally descended from heaven. There is even evidence that in later times she managed to supplant the goddess of heaven, An (Antum), as spouse of the god of heaven, An (Anum), and became queen of heaven. In the *Eclipse Myth* she unsuccessfully conspires with the storm demons to obtain that position, but in a later myth, the *Elevation of Inanna*, the august assembly of the gods itself petitions An to marry her, and she is invested with supreme powers among the gods.
5. Finally, as protector of harlots, Inanna was herself envisaged as a harlot. Her original form in this aspect was that of the owl, which, like the harlot, comes out at

dusk. Correspondingly her name as harlot was *Ninnina* (“mistress owl”). In Akkadian her name was *Kilili*.

In the myths dealing with Inanna a frequently occurring motif is her insatiable desire for power. In the *Eclipse Myth*, as noted, it leads her to conspire with the evil storm demons; in *Enki and the World Order* she complains bitterly that all other goddesses have offices and only she has none, so Enki tries to assuage her. In the myth *Inanna and the Parse*, that is, Inanna and the divine offices called in Sumerian *me*, we are told how she visited Enki in Eridu, how he drank deeply at the party welcoming her, and how in an expansive mood he conferred upon her one office after another. Wisely, she decided to leave immediately for home with her newly won offices, so that when Enki woke up sober and wanted the offices back it was too late. The myth lists the offices one by one; they constitute a formidable list. Owing, probably, in large part to the syncretistic background of the image of Inanna, the offices attributed to her show little unity or coherent pattern; rather, they form a motley collection of variations. That did not trouble the ancients though; instead, they gloried in Inanna’s versatility, and a major hymn to her even makes a point of praising her as goddess of opposites, of insult and veneration, downheartedness and good cheer, and so on.

Inanna’s lust for power is also an important motif in the best known of the myths about her, *Inanna’s Descent to the Netherworld*. It prompts her to descend to the realm of death to wrest queenship over it from its rightful queen, Ereshkigal. The attempt fails, and Inanna is killed and turned into a cut of meat gone bad and hung on a peg. When she fails to return, her loyal handmaiden Ninshubura seeks help, first from Enlil in Nippur, then from Nanna in Ur, and finally from Enki in Eridu. Only Enki can think of a means to help. He creates two creatures from the dirt under his fingernails and sends them to the netherworld with instructions to condole with Ereshkigal, who, as is her custom, laments children who have died before their time. Then, when moved by the creatures’ concern she grants them a wish, they are to ask for the tainted meat hanging on a peg and to throw on it the grass and water of life which Enki has given them. They follow the instructions, and Inanna rises alive. As she is about to leave the netherworld, however, its ruling gods stop her and decree that she must provide a substitute to take her place. So she is accompanied by a detachment of netherworld police to ensure that she will designate a substitute to go back with them.

On the journey back to Uruk she is met by one loyal servant after another, all clad in mourning for her, and she refuses to hand any of them over to the demons. When they reach Uruk, however, they come upon her young husband, Dumuzi, sitting in fine clothes and enjoying himself listening to the music of reed pipes. This flagrant lack of concern infuriates Inanna, and in a flash of jealous rage she hands him over to the demons, who carry him off. In his distress he calls upon his brother-in-law, Utu, god of justice and fairness, and

asks Utu to change him into a gazelle—in another version into a snake—so that he can escape his captors. Utu does so, and Dumuzi escapes, only to be again caught; again he escapes, until finally he is caught for good in his sheepfold. The story ends with Dumuzi’s sister Geshtinanna, the goddess of the grapevine, seeking him. Eventually, advised by the Fly, she finds him and joins him in the netherworld. In distress at the undeserved misfortune of both Dumuzi and his sister, Inanna decrees that they may share the obligation to serve in the netherworld as her substitute: Dumuzi will serve half a year below; then he will return to the world above while his sister takes over. She in turn will return after half a year as he goes below.

This ends the tale, and a closer look at it will suggest that *tale* rather than *myth* is the proper designation, for it is most easily understood as a composite of dead myths put together for dramatic effect by the storyteller and haphazardly embellished. The myth of Inanna’s death and transformation into a cut of spoiled meat is best understood as an original myth in which she represents the underground storehouse for meat; she becomes like a grave when the meat rots in summer, but she is revived—as the storehouse is restocked with fresh meat from the flocks fed on the grass and water of life, the pastures of spring. The myth has nothing to do with Inanna’s aspect as the morning star, in which the storyteller has her present herself when she seeks entry into the netherworld. The second part of the tale was originally a separate myth dealing with Dumuzi rather than with Inanna, and it has also come down, in slightly variant forms, as a separate, self-contained myth.

Dumuzi. Like Inanna, and perhaps even more so, does her lover and bridegroom, Dumuzi (Tammuz), present a highly complex, syncretized image, one in which it is not always easy to sort out cleanly the various strands woven into it. Some fairly distinct aspects do, however, stand out and may reasonably be assumed to represent originally separate, independent deities. They are the following.

1. *Dumuzi as Amaushumgalana*, the power for productivity in the date palm. His marriage to Inanna as numen of the storehouse celebrates the bringing in of the date harvest. His cult was based in Uruk.
2. *Dumuzi the shepherd*, the power causing ewes to produce normal, well-shaped lambs. His bride was Inanna as goddess of the spring rain showers that call up verdure for pasture in the desert. The vanishing of the power he represented when the lambing season came to an end was seen as the death of the god, to be observed with wailing and lament.
3. *Dumuzi of the beer*. No separate distinctive name sets apart this aspect of the god. The texts dealing with it sometimes use the name *Dumuzi*, sometimes *Damu*. They involve the search for him after his death by his sister and mother.
4. *Damu the child*, the power for the sap to rise in plants

and trees in the spring. Considered lost during the dry summer, he was sought by his mother and found coming down the river, presumably with the beginning of the early flood in spring. His cult was based in Uruk.

5. *Damu the conscript*, an aspect of the god under which he was seen as a young boy liable for military service. He has been taken forcibly from his mother by brutal recruiters, and she seeks him, gradually realizing that he is dead. What precise power he represented is not clear; most likely it was one connected with the welfare of cattle herds. His cult was based in Girsu (Tello) on the Euphrates.

The myths about these various aspects of Dumuzi naturally fall into two groups, those dealing with wooing and wedding and those dealing with his death and the search for him. To the first group belongs a dialogue between Inanna and Dumuzi in which he has found a house for them near her parents. She does not know that they have chosen him as her future husband, and he teases her, stating that his family is like her family, as it were. Eventually he enlightens her, and she is well pleased. The Inanna of this tale seems very young. Slightly older, she appears in a tale in which Dumuzi's sister Geshtinanna tells him that Inanna invited her in and told her how she, Inanna, suffered from love for her brother. Dumuzi is quick to ask leave to go, and is off to ease the damsel's suffering. At about the same age, Inanna appears in a different story, awaiting Dumuzi toward evening. They had met and fallen in love the day before, and when Dumuzi appears he impetuously propositions her. She promptly turns him down and apparently—the text is broken here—makes him propose properly. When the text resumes they are on their way to her mother's house to announce the engagement.

Another story tells how Inanna's brother Utu has arranged a marriage for her but is unsure about how she will receive the news. He therefore speaks obliquely, proposing to bring her fresh flax for a linen sheet. He does not say that it is to be her bridal sheet, but she immediately understands. Afraid to hear her brother's choice in case it turns out to be a wrong one, she postpones the crucial question, pretending that she has nobody to ret the flax, spin it, double the thread, weave it, dye it, and bleach it, but each time Utu offers to bring the flax already prepared. So at last she has to come to the point: who is to lie down with her on it? When Utu tells her it is Amaushumgalana, she is overjoyed. The wedding itself is recounted in a tale which begins with Inanna sending for her bridegroom and attendants, specifying what gifts they are to bring. They appear before the house, but Inanna is in no hurry. She bathes and dresses in all her finery and listens to instructions from her mother about the obedience due to her parents-in-law. Eventually she opens the door to Dumuzi—the formal act that concludes a Sumerian marriage—and presumably (the text is broken here) leads him to the bridal chamber for the consummation of the marriage. A wedding feast probably follows the next morning. When the text resumes, Dumuzi is leading his young bride

to his house and wants first to take her to his personal god that he may bless the marriage. But Inanna is thoroughly frightened, so Dumuzi tries to hearten her by telling her what an honored position she will occupy in the household and how no domestic work whatever will be demanded of her.

The other group of myths, centering on the death of the young god, is perhaps best represented by the myth called the *Dream of Dumuzi*. In it, Dumuzi has an ominous dream that Geshtinanna interprets as boding death for them both. Dumuzi sends her up on a mound as lookout, and she reports the arrival of a boat with evil recruiters. Dumuzi decides to hide in the desert, but first he tells his sister and colleague where he will be. When the recruiters land and offer bribes for information, Geshtinanna is steadfast; however, the colleague betrays his friend. Dumuzi is captured but appeals to Utu to help him escape by turning him into a gazelle. Utu does so, and Dumuzi does escape, only to be again caught. This repeats itself until he flees to his fold. The pursuers break in, wrecking everything on their way, and Dumuzi is killed. A similar myth, the *Most Bitter Cry*, also describes the attack on the fold and the rude awakening of Dumuzi, naked and a prisoner. He manages to escape and flees toward Uruk. As he tries to cross the Euphrates, however, he is swept off by the flood and drowns before the eyes of his horrified mother, Duttur, and wife, Inanna.

Lugalbanda and Ninsuna. Lugalbanda ("fierce king") and Ninsuna ("mistress of the wild cows") were apparently city god and goddess of Kullab, a city that was early absorbed into Uruk. Both were deities of cattle, but with the absorption of his city Lugalbanda seems to have lost definition, and even his divine status. He appears in historical times predominantly as an ancient king of the first dynasty of Ur, and his achievement in the extant epic about him, that of a supernaturally gifted messenger, was probably tacked on precisely because nothing else was known about him. Ninsuna for her part managed to keep her divine status. She was the tutelary goddess of Gudea of Lagash and, curiously enough, in that role was the consort of Ningishzida, not of Lugalbanda.

Ningirsu. Ningirsu ("master of Girsu") was the city god of Girsu, with the temple Eninnu. His wife was the goddess Baba. Ningirsu was god of the thunderstorms in spring and of the spring flood of the Tigris. His early form was that of the thunderbird, an enormous eagle or vulture with a lion's head out of which thunder roared. Ningirsu was early identified with Ninurta of Nippur, and a great deal of his mythology was therefore transferred to the latter (it has been discussed above). *Ninurta* was also the name under which the god was borrowed by the Assyrians when he became prominent as god of war.

Gatumdug. Gatumdug was goddess of the city of Lagash (Al Hiba), south of Girsu. The meaning of her name is not clear, but other evidence suggests that she was also a goddess of birth giving.

Nanshe. The goddess of fowl and fish was Nanshe. She was city goddess of Nina (Zurghul), with the temple Siratr.

She was, according to Gudea, the interpreter of dreams for the gods.

Ninmar. City goddess of Guabba and seemingly a goddess of birds was Ninmar.

Dumuzi-Abzu. Dumuzi-Abzu was city goddess of Kinirsha, and the power for fertility and healthy new life in the marshes.

Nininsina. Nininsina (“mistress of Isin”) was city goddess of Isin (Ishan Bahriyat), south of Nippur, which served as capital of Sumer for most of the time after the third dynasty of Ur until the advent of the Old Babylonian period. She seems to have been envisaged in the shape of a dog and was presumably the goddess of dogs. Her special powers were those of the physician. Her daughter Damu—different from the boy of Girsu on the Euphrates—followed in her mother’s footsteps as goddess of healing.

Ereshkigal. The name of the goddess Ereshkigal (Allatum) meant “queen [of the] greater earth.” The ancients believed that there was a “larger heaven” above the visible sky that connected with a “larger earth” below the observable earth. In the larger earth was the realm of the dead, of which Ereshkigal was queen, although a variant—and conflicting—belief located the realm of the dead in the eastern mountains. The ancients imagined it as a walled city. As with cities on earth, the wall served not only to keep out enemies but also to keep in people—as, for instance, the slaves—who were not free to leave the city. It had its own police and a court where the sun god presided during the night. Existence there was dreary. If one had no son to make funerary offerings, one lived like a beggar, but with many sons one could enjoy a degree of comfort. Reasonably well off were also young men killed in battle—they had their parents take care of them—and small children, who played with golden toys. In the second and first millennia ideas about existence below seem to have become even darker: dust was said to cover all; the dead were clad in feathers like birds; and when an Assyrian prince visited the netherworld in a vision, he found it full of horrifying monsters. Ereshkigal herself was cast in the image of a mourning woman, pulling her hair and raking her body with her nails for grief as she lamented the children dead before their time. In the late myth of Nergal and Ereshkigal she plaintively tells of her joyless life: even when young she never played as other young girls did. Ereshkigal’s husband seems to have been originally Gugalanna (“great bull of heaven”). A variant, perhaps later, tradition has Ninazu as her spouse, and finally Nergal became king of the netherworld with Ereshkigal as his queen.

Ninazu. The meaning of the name *Ninazu* is not clear, but it apparently has to do with water. Most likely, since he was a netherworld god, his name refers to the waters underground. His wife was Ningirda (“mistress [well-]rope”), a daughter of Enki. In the north, in Eshnunna (Tel Asmar) in the Diyala region, where his Akkadian name was *Tishpak* (“outpouring”), he was a god of rain storms. His city in the south was Enegr on the lower Euphrates.

Ningishzida. Ningishzida (“master of the well-grown tree”) was the god of trees, especially the powers in the root that nourish and sustain the tree. As god of tree roots he was naturally seen as an underground, netherworld power. His office there was that of throne bearer, an old title for the head of the constabulary. Ningishzida’s wife was Azimua (“well-grown branch”). His city was Gishbanda on the lower Euphrates. The ancients thought that there was a common identity between tree roots and snakes, the latter being roots moving freely. Accordingly, Ningishzida was also the god of serpents, and his older form, as noted above, was that of the stock of a tree around which serpent roots wind, the whole resembling the Greek caduceus.

Nergal. The other names of Nergal (“lord great city”), originally probably designating different gods, were *Meslamtaea* (“the one issuing from the luxuriant *mesu* tree”) and *Irra*. *Meslam* or *Emeslam* (“house Meslam”) was the name of Nergal’s temple at Cutha, in Akkad.

A myth preserved in a copy found at Tell al-‘Amarna in Egypt and dating from the thirteenth century BCE tells how Nergal came to be king of the netherworld. Once when the gods were feasting they sent a message down to Ereshkigal inviting her to send up her vizier, Namtar, to fetch her a portion of the delicacies. She did so, and when he arrived all the gods rose respectfully except one, Nergal, who rudely remained seated. When Namtar reported this, Ereshkigal furiously demanded that the offending god be delivered up to her so that she could kill him. But when Namtar came for Nergal, Ea had changed his appearance so that Namtar did not recognize him. Later, however, Ea told Nergal to take a throne down to Ereshkigal to placate her. Nergal was understandably reluctant, but Ea insisted and gave him demons to hold open the gates of the netherworld so that he could get out fast if needed. However, he met with no resistance, pulled Ereshkigal down from her throne by the hair, and threatened to kill her. When she pleaded for her life, offering marriage and rule over the netherworld, Nergal accepted, kissed her, and wiped away her tears, saying wonderingly, “It was but love you wanted of me from months long ago to now.” A later version greatly enlarges on the tale. It has Nergal visit the netherworld twice, the first time to bed Ereshkigal against Ea’s advice and to escape, the second time to stay after Ereshkigal has passionately pleaded with the gods for his return.

Another myth, the *Irra Epic*, celebrates Nergal under the name *Irra* (an Akkadian name meaning “scorched earth”), which most likely originally designated a separate god. The epic tells how Irra was roused to action by his weapon, Sibittu (the name means “heptad”), and how he persuaded Marduk to leave him in charge of the world while Marduk went to have his jewels cleaned. Irra’s first act was to foment rebellion in Babylon and have it ruthlessly put down by the commandant of the Assyrian garrison in that city. Next Irra had riots, rebellions, and wars spread all over the country, and might have destroyed it completely had not his vizier,

Ishum, reasoned with him and persuaded him to leave a remnant. The epic ends with self-praise by Irra, who nowise regrets his deeds of violence—rather, he suggests that he may cut loose again at any time.

Ashur. Ashur was city god of Ashur (Qal'at Shergat) and chief god of Assyria. No recognizable features characterize him other than those that belong to his role as embodiment of the political aspirations of his city and nation. Even his wife and the name of his temple are not truly his own; they were borrowed from Enlil as part of Ashur's aspiration to the universal dominion for which Enlil stood. Basically, thus, he may in origin simply have been a *numen loci*—a spirit inhabiting a place and imbuing it with its character—named from the place where his presence was sensed.

THE TEMPLE. The earliest Mesopotamian temples may have been in origin storehouses in which nomadic or seminomadic tribes kept their sacred objects and provisions, which were too cumbersome to carry along on their wanderings. Very soon, though, these structures would have been considered, as always later, dwellings of the gods to whom they belonged. The earliest recognizable form was that of a dwelling house with a large, rectangular middle room from which two smaller rooms projected at the end, creating a T-shaped effect. With time the projecting rooms disappeared and left a rectangular room that was entered from a door in one of the side-walls near its end. At the short end-wall farthest from the door was a dais that kept the seat of the owner, in this case the god, out of the floor-level draft. In later times a niche in this end-wall steadied a baldachin, or tentlike aedícula, further protecting the god. Before the dais a curtain shielded him from profane eyes. On low benches along the side-walls stood statues of worshipers to remind the god of the people they represented and their needs. The god himself was, to judge by depictions dating from as early as the late Uruk period, represented by a statue in physiomorphic or anthropomorphic form. Facing it—conceivably inside the hanging—stood a large vase with greenery of various kinds, sometimes placed over a drain, into which petitioners received in audience by the god would pour libations before presenting their petitions.

Temples were by preference built on existing high ground; in addition, frequent rebuildings, during which stumps of the old walls were left while their upper parts were dumped in the space between them as fill to make a new building site, tended to create a small mound under the new rebuilding. In fact, this development, by which a temple came to stand on the walls of earlier ones, became in later time so much a part of the concept of a temple that builders created underground artificially filled-in walls for the actual walls to rest on. Such a filling was known as a temple terrace (*temen*). At the time of the third dynasty of Ur, possibly already in the time of the dynasty of Akkad, these mounds were built high, with stairs leading up to the temple on top, and were squared off to form a stage tower, the so-called zigurat. With larger temples it became customary in early dy-

nastic times to surround them with a protective oval wall, called an *ibgal*. The pattern for this may conceivably have been the long curved pile of camel-thorn gathered for fuel with which bedouins—then as now—ringed their camps in the desert. It served the double purpose of protection and a handy fuel supply. Inside the oval, along its sides, were the various storerooms, kitchens, and workshops for the temple personnel, while the house on top of the terraced tower constituted the god's living quarters: bedroom, bath, and so on. Often a few side rooms were added to the central structure.

In time—as can be seen by comparisons of temple plans from Khafaje with those for the later one at Ishchali—a tendency toward squaring off the oval and greatly enlarging the plan of the temple on the high terrace led to a new concept of the older design. The central room was enlarged so that its lower parts with the door became the size of a court. At its end the hanging or hangings were replaced with walls having doors in the middle, thus creating a rectangular cella with the niche and dais at the middle of the far side-wall, a so-called broad-room cella, which became standard for Sumero-Akkadian and Babylonian temples from the third dynasty of Ur on. The remainder of the original central room developed into a court with surrounding rooms. A gate and covered landing midway up the stairs leading to the temple above often served as court of justice in which the god sat in judgment. In Assyria the development from the bent-axis approach took a different course. There the door was relocated around the corner nearest to it to the middle of the end-wall facing the wall with the niche and dais, thus creating the long-room type of temple.

The temple, rising over the houses of the community, was visible and tangible proof of the god's presence and, more, that he was himself a member of the community and had a stake in it, with his house, his servants, his oxen and sheep, and his fields in grain. To have the temple was a privilege. To build it or rebuild it needed divine approval, which was not always granted. The story of the *Cursing of Akkad* told of the dire consequences of King Naram-sin's willful decision to rebuild Ekur in Nippur without Enlil's permission. Even rebuilding after enemy attack and demolition needed divine cooperation. The god had to be roused from his state of shock after the catastrophe to make him able to act, so laments to soothe him and to recall past happiness were part of the ritual. Originally these laments had clear reference to a specific historical situation; later they were generalized for wider use. In later times they became obligatory for any rebuilding, since that implied demolition of the existing structure, and some even became part of the daily program of temple music and were used to awaken the temple personnel in the morning. Older than the laments for the destruction of a temple are, it would seem, hymns to temples. They celebrate the specific powers inherent in the temple to uphold the welfare of the country. The *Cursing of Akkad* tells how the peace of the country, its harvest of grain, and so on vanish when corresponding parts of Ekur are demolished. In fact,

the temples shared in inordinate measure in the particular kind of holiness that characterizes the gods inhabiting them, and it is often difficult to distinguish between god and temple. The temple shares name and function with its god as if it were his embodiment.

THE CULT. The communal cult of the gods was of two kinds, celebrating the appropriate festivals of the various gods at appropriate times and providing daily services such as would be required by any high human dignitary. The earlier of these are undoubtedly the festivals, most of which are best understood as communal magic rites for prosperity developed into cult dramas performed by community representatives. There is evidence for various types of such dramas: the Sacred Marriage, the Death Drama, the Journey Drama, and the Plowing Drama. Others may have existed.

The Sacred Marriage is attested in Uruk as early as the late Uruk period. The ruler (*en*) “became” the god of the date palm, Amaushumgalana, and brought the harvest as wedding gift to the date storeroom of the temple. His wife—one presumes—similarly “became” the goddess of the storehouse, Inanna, and opened the door for him, thereby concluding the marriage and lasting union of the powers for producing and storing the dates. Their meeting at the gate is depicted on the famous Uruk Vase and on contemporary cylinder seals. In this early form the source of abundance clearly was the god. In later times—as shown by materials from Isin and Larsa—emphasis oddly changed, and the goddess came to be seen as the conveyor of bounty. The high point was now a blessing by the goddess of the marital couch after the king had proved his prowess as bridegroom. By Isin-Larsa times, too, focus was no longer narrowly on dates but on prosperity generally. A special form of the rite—perhaps at home among herders—saw it still quite directly as sympathetic magic for fertility. Here the rising of the king’s member in the sexual congress of the rite immediately made plants and greenery shoot up.

The Death Drama had the function of performing for the dying god of fertility—characteristically Dumuzi—the rites of lament due to the dead. Such data as we have suggest that processions of mourners went into the desert in early summer lamenting the god of dirges sung by representatives of his mother, sister, and young widow. The rite was a magic strengthening of the emotional bonds with the god, a seeking to have him back.

In the Journey Drama, the god, perhaps represented by his image or an emblem, traveled to visit a god in some other city. There are references to a yearly visit to Eridu by Ningirsu traveling from the Lagash region, and similarly there are texts connected with such a journey by Ninurta of Nippur. Whether in so traveling these gods conferred a boon on Enki and Eridu, or conversely were themselves the beneficiaries, is not always clear. In a myth about Enmerkar, founder of Uruk, a ritual journey he made to Eridu is mentioned in terms suggesting that he was reconfirmed or enhanced in his office of lord (*en*), that is, of provider. Most likely also the

myth of Inanna and the offices she obtained from a not-too-sober Enki preserves memories of a rite in which Inanna’s various offices were authenticated from Eridu. A rather full statement of a ritual journey is given in a text describing how Nanna of Ur travels up by boat to visit his father, Enlil, in Nippur, bringing first fruits from the products of the south. He is warmly received and leaves to go back to Ur with matching gifts from the agricultural lands around Nippur. The Plowing Drama of Ninurta’s festival that opened the plowing season in Nippur is thus far unique. The king himself guided the plow, and a report was made to Enlil.

Last there is the Battle Drama. It seems to be at home with gods of the thunderstorms of spring, Ninurta and Marduk, and it is conceivable that it was once performed to activate these powers, to rouse the thunderstorms that were seen—as in the relevant myths—as the divine warrior attacking the mountains. There is, however, no evidence so far to indicate performance in such terms. The name of Marduk’s main festival, Akitu (“time of the earth reviving”), does, as mentioned earlier, refer to an early aspect of him as the power causing natural abundance, but there is no indication of any battle drama. Such ritual evidence as we have for this type of drama all shows a later, completely politicized form behind which little if any trace of earlier implications survives. The materials for the Battle Drama are contained largely in cultic commentaries from Ashur, which, however, are clearly Babylonian in origin and reflect the bitter political rivalry between Babylon and the Sea Land to the south. Braziers and torches are lighted to signify the burning of Kingu, Anu, and Enlil. A chariot arriving with great show of martial prowess is Nabu, who was sent against Enlil and now returns victorious. A loaf of bread is bounded by the king and a bishop, who represent Marduk and Nabu. The loaf is the heart of Anu, whom Marduk bound and whose heart he tore out.

The Babylonian epic of creation, *Enuma elish*, which tells how Marduk “vanquished Tiamat and assumed kingship,” reflects the same political conflict, with Marduk representing Babylon and Tiamat representing the sea and the Sea Land. It is generally—and perhaps rightly—assumed to be a cult myth corresponding to a dramatic ritual reenactment of this primordial battle each new year. However, our knowledge about the actual ritual of the Akitu festival in later times is scant in the extreme. We know that *Enuma elish* was read on one occasion and that Sennacherib, when he tried to transfer the festival to Assyria with Ashur as its hero, decorated the gates to his Akitu house with a relief showing the battle with Tiamat, but that is all. Otherwise such information as we have indicates that on the tenth of the month of Nisan, Marduk traveled by boat to the Akitu house, where a feast was celebrated on the eleventh, and that he then returned to Babylon. That is all. Not usable, unfortunately, for reconstructing the festival is a lengthy commentary called—not too happily—*Death and Resurrection of Marduk*. It has been shown to be an Assyrian, anti-Babylonian propaganda pamphlet, and it does not mention any death of Marduk.

The trend toward sociomorphism imposed on the gods the patterns of the human family and household, and this in turn implied service such as was rendered to a human magnate in providing for his bodily comfort and assisting in the running of his estate. All of this became the daily temple cult, as described earlier. A further implication of anthropomorphism and sociomorphism was that since the god had become ruler of the community, it was essential to know what he wanted done. Thus a variety of methods of communication was developed. Some of these left the initiative to the god: he might show signs in the stars or on earth that the initiated could interpret. Others were available when man needed to know the divine will. The earliest of these methods of communication of which we have evidence are dreams sought by incubation in the temple, and inspection of the liver of a sacrificed kid for propitious or nonpropitious shape. This latter method was used by Gudea as a check on the message obtained when he was dreaming. An extensive and highly detailed literature serving as textbook for these and many other manners of prognostication developed during the second and first millennia. Originally meant as guides for rulers and war leaders, this literature soon broadened its scope to take in the fortunes of ordinary citizens.

For conveying human wishes and needs to the gods and asking for help, a ritual of seeking audience to present petition and prayers was developed. The petitioner was led in before the deity with his greeting gift, usually a lamb or a kid. Here he libated water or wine in a huge vase with greenery that stood before the deity, and he spoke a formal greeting prayer. He then presented his petition. As the ritual for seeking an audience with the god was an occasional one, dependent on special circumstances, so the cult comprised other rituals for use in exceptional situations. I have mentioned the elaborate one called Bitrimki ("bathhouse"), which aimed at lustration of the king when he was threatened by the defiling evil of an eclipse of the moon; others were available for the rebuilding of a temple or for making or replacing a cult statue. In this last ritual great pains were taken to nullify by powerful incantations the fact that the statue was a work of human hands, and to make of it instead a god born in heaven.

The cult so far described was the communal, public cult. There was, however, a private cult as well. City life and its ever-greater differentiation between the fortunes of families and individuals and those of other families and individuals encouraged feelings that special success was due to a god's personal interest in a man and his family, while, conversely, misfortune would seem to be due to the god's abandonment of his ward for some reason or other. Thus the term for having luck became "to acquire a god." Since no achievement could be had without divine help, that of engendering a child necessarily implied such intervention. A god and goddess entered the body of the human father and mother and made the mother conceive. Thus the god and goddess who were assumed to have helped became family deities and were visu-

alized in the image of a father and mother. As such they also took on the protective roles of parents, chief among which was to defend their wards against demons of disease and inspire successful thought and action. They had their altars and received daily offerings in the house of their wards, and prayers and petitions were addressed to them there.

The close connection between the personal god and success could not but raise problems, for experience showed that virtue was not always rewarded; rather, a virtuous man might fall ill or suffer other miseries such as should have happened to evildoers only. The obvious solution, that the virtuous man unwittingly must have offended his god, was accepted in a measure, and prayers often asked for enlightenment as to how a sufferer had sinned, so that he could do penance and mend his ways; but as a general explanation it did not carry full conviction, and the vexing problem of the righteous sufferer arose. It is dealt with in two major compositions datable to Middle Babylonian times. One is called *Ludlul* ("let me praise"), after its beginning, "Let me praise the possessor of wisdom." It tells of a pious and just man who suffers one misfortune after the other but does not lose his trust in Marduk. Eventually Marduk takes pity on him and restores him to health and prosperity. No real answer to the problem of why he had to suffer is attempted; the text merely holds out the conviction that the gods can have a change of heart and take pity. The other composition is known as the *Theodicy*. It is in the form of a dialogue between two friends about the fact that evil men appear to prosper, whereas good men fall on evil days. Here, too, there is no real answer, only a conviction that eventually retribution will come to evildoers.

The question of the innate justice—or, rather, injustice—of existence is also dealt with in a famous work known as the *Epic of Gilgamesh*. It tells how Gilgamesh, an ancient ruler of the city of Uruk endowed with exceptional vigor, drives his people too hard. They complain to the gods, who create Enkidu, a wild man who becomes a friend and brother of Gilgamesh. Together they set out to kill a famous warrior, Huwawa, who lives far away in the cedar mountains. They succeed. After their return to Uruk, Gilgamesh scornfully turns down a marriage proposal from the city goddess Ishtar. In her anger at being rejected she borrows the bull of heaven in order to kill Gilgamesh, but he and Enkidu overcome it. Then, however, things catch up with the two friends: the gods decide that Enkidu must die for having killed Huwawa. Gilgamesh is inconsolable at the loss of his friend and at the thought that he, too, must die. He therefore sets out on an arduous journey to an ancestor of his, Utanapishtim, who had gained eternal life. Eventually Gilgamesh reaches him, but Utanapishtim has no solace to offer. He invites Gilgamesh to try fighting Sleep—Death's younger brother, so to speak—but Gilgamesh fails miserably to keep awake. So Utanapishtim gives him clean clothes and sets him on his way home. There is no escape from death, however unjust it seems that man may not live forever.

It seems likely that the original epic ended here. At a later date, probably in the Middle Babylonian period, a certain Sinliqunnini reworked the epic from a radically different point of view. Where the outlook of the earlier epic was tragic—a tale of a quest for eternal life that failed—the reworking saw Gilgamesh as a heroic traveler to romantic foreign parts who recovered hidden knowledge of the ancient times. A long story about the flood was added, as well as a further tale about a plant with the power to rejuvenate, which Gilgamesh obtained only to lose it again by carelessness. An introduction and conclusion stressed Gilgamesh's achievements, including lasting fame as builder of the city walls of Uruk. Finally, part of a Sumerian tale in which Enkidu describes conditions in the netherworld was tacked on, perhaps by some copyist. Passionate protest against existential evil thus became pleasure in romantic quest for hidden knowledge in faraway lands.

MESOPOTAMIAN RELIGIONS: AN OVERVIEW [FURTHER CONSIDERATIONS]

The Sumerians, who built human civilization over their thousand-year history, from 3000 BCE to 2000 BCE approximately, were not the only players on the Mesopotamian social and political stage. As we turn the pages of their history, we find that there is another ethnic group, of Semitic origin, living in the same territory at almost the same time, a people conventionally known as the Akkadians, who came to power and took control of the entire region in 2350 BCE under their king Sargon the Great, founder of a dynasty of the same name.

At least until the 1950s and 1960s, there was a lively debate amongst Assyriologists—on the one hand, those who believed that there was an ethnic link between the Sumerians and the Akkadians, almost a direct symbiosis, and on the other, those who, while not overemphasizing that they were different racial groups, stressed that their ways of life were basically different, in their model of political thought, in their cultural traditions, even in the different languages that they spoke. The Sumerians spoke an agglutinative language ("Sumerian"), whereas the Akkadians spoke an inflected Semitic language ("Akkadian").

In 1970 F. A. Kraus, holding that the use of a different language did not necessarily relate to different ethnic origins, concluded that "the Sumerian and Akkadian texts are evidence of the same culture, namely Babylonian" (pp. 1ff.) In the following year Giovanni Pettinato published *Das altorientalische Menschenbild und die sumerischen und akkadischen Schöpfungsmythen*, in which he maintained exactly the opposite position—that, at the very least, language is an important piece of evidence in the investigation of the cultures of these two peoples. Simply on the basis of mythological texts concerning the creation and conception of the human race, Pettinato reached the conclusion that, contrary to what is published in books on Mesopotamian history and civilization, the Sumerians and the Akkadians, the two main peoples that inhabited Mesopotamia, had very different approaches to such matters, and this is central to our understanding of their thinking. The Sumerians and the Akkadians were exponents of two quite distinct cultures, with mutually incompatible principles and ideals. Thus the opinion put forward by Assyriologists concerning this symbiosis seemed to be completely incorrect and not borne out by the surviving documentary evidence, which has been even more firmly established and developed in recent years.

In 1992 W. G. Lambert proposed a comparison between Sumerian and Akkadian tales of the creation of the human race and stated that the two traditions had certain fundamental motifs in common, concluding: "for the moment it is most sensible to consider the two mythological corpora as expressions of a single culture" (Lambert, 1992, p. 130). He comes to the same conclusion when he compares the Sumerian narratives of the Descent of Inanna with the Akkadian versions concerning Ishtar. The studies of Stein-

keller (1992) and Durand (1993), which demonstrated the existence of a Semitic mythology that was completely different and alien to the Sumerian, were of no avail, because all this left Heimpel completely unmoved; for him, Kraus's theory remained unchanged and unchangeable. In fact, Falkenstein was probably right when he stated that the Sumerians and the Semites (= Akkadians) maintained and propagated two very different traditions. Subsequent studies have confirmed the views of Pettinato (1971), and the discoveries at Ebla, in ancient Syria, have provided us with evidence of a level of civilized development and a cultural heritage to match the richest and most abundant in the Sumerian world. For these reasons, it is both useful and necessary to examine the two cultures, the Sumerian and the Akkadian, separately, because only in this way will we be able to join the dots together and thus understand the interchange between different cultures, something which is now a primary duty of our research.

SUMERIAN BELIEFS. To understand the essentials of Babylonian religion we should refer to the beliefs of the first inhabitants of Mesopotamia, the Sumerians. Only a few key aspects of Sumerian religious literature were of interest to the Babylonians; for example, there was no information concerning the origin of the cosmos, which interested the Babylonians keenly. What was of far greater significance to the Sumerians was the organization of their own world, in which the divine intervened regularly. The Sumerians had two leading gods in their divine pantheon: Enlil, the poliad god of Nippur, and Enki, the poliad god of Eridu. The first is the undisputed head of the Sumerian pantheon, the second is the god of wisdom par excellence. Besides these two main divinities, another god, the father of both, plays a prominent role in the Sumerian religious outlook—An, the god of the sky. These three gods formed the supreme triad of the Sumerian pantheon around which all the other gods revolved. Their role in the world was well defined and constantly overseen by the assembly of the gods. It is no coincidence that Babylonian astronomy was based upon these three Sumerian divinities, nor indeed that the astrological series *Enuma Anu Enlil* begins with these words: “When the gods Anu, Enlil, and Ea prepared the outline of heaven and earth. . . .” (Ea is the Semitic name of the god Enki, and Anu is the Semitic form of the Sumerian An.)

There were naturally other important gods, such as the seven mother goddesses led by Ninhursag, the mother of all creatures, and the three astral gods of the sun, moon, and Venus, respectively called Utu, Nanna, and Inanna. The sun god, whose watchful eye never falters, guarantees justice; the moon god lights up the earth by night and lets travelers find their way in the dark; Inanna (Venus) is the goddess of love and war, a very important figure in the pantheon, who along with her two brothers Nanna and Utu controls the smooth progress of events, but in particular guarantees the kingship. It is no less important to note that Inanna was the poliad goddess of Uruk, as Utu was the god of Sippar and Nanna

of Ur, cities of major historical importance from 3000 BCE onwards.

From the mythological literary compositions dealing with the creation of the human race, which the traditions of Nippur and Eridu attribute respectively to the gods Enlil and Enki, we learn that the main gods had various spheres of influence, as follows: An, the sky; Enlil, the earth; and Enki, the waters of the deep. Thus Enlil is the ruler of the earth and everything that happens there is in a certain sense controlled and determined by him.

Humanity's attachment to the divine world is expressed in terms of a deliberate, and perhaps even joyful, obedience. The human race, as the Sumerians considered it, had been created to carry on with the gods' work of putting the world in order. Well aware of the onerous nature of the work they had been created to carry out, the Sumerians accepted this burden willingly, confident of leaving a permanent impression, just as the gods had done when they had created the world. What the texts emphasize, from different angles, is the presence within human beings of a divine element, bestowed by either Enki or Enlil, according to the two different traditions, which allows them to survive the finality of death; there is firm belief in an afterlife. There were some attempts to overcome death, as in the effort of Gilgamesh, but the firm laws established by the gods from the time of creation were accepted without argument by the Sumerians.

Although the creation texts, because of their concise nature, do not indicate the evolution of the human race, both Sumerian documents referring to the Nippur tradition and the Chaldean Berosus, dealing with the Enki variant, stress in no uncertain terms that man became a city dweller by going through various stages of development. In the Nippur tradition, after human beings had been created they were living like wild animals and behaved as such. It was only after Enlil instilled in them the vital spiritual spark, that is, the divine element, that the human race was ready to undertake the task of organizing the world. The story told by Berosus of the early stages of human development is even more significant: in this tradition too, human beings were ignorant of the benefits of civilization, so Enki, the god of wisdom, had amphibian creatures that were half-fish, half-human emerge from the ocean depths and live with human beings, teaching them how to behave in a civilized way, and instructing them in all the arts. These are the renowned *apkallu*, known from cuneiform literature, who after this first stage of human development served the king of the earth as his advisers when the gods sent down the kingship from heaven. Gilgamesh, the mythical king of Uruk, was the first to have a purely human adviser, signifying in its way a break in the history of humanity as decisive as the first real break, which was caused by the direct intervention of the gods—the Universal Flood.

EARLY BABYLONIAN BELIEFS. The Sumerians transmitted their religious ideas in myths, hymns, and wisdom texts, which the Babylonians, once they arrived in Mesopotamia,

began to copy and translate so that the knowledge of the Sumerian world would not be lost. In the schools of Babylon and in other centers of learning, knowledge of the previous peoples was preserved and began to be developed, and it was adapted to later people's own beliefs. It should not be forgotten either that the Assyrians, although mainly preoccupied with war, did not scorn the culture of the Sumerian and Babylonian schools, as shown in that miraculous monument to human history, the library at Nineveh, from which the vast majority of the literary texts written by the inhabitants of the "land between the two rivers" now come. Although it had the highest regard for the previous tradition, which she welcomed in toto, Babylon nonetheless was faced with a problem of enormous proportions—how to introduce the principal Babylonian god, Marduk, into the established Sumerian pantheon.

The Mesopotamian kingship was regarded by the inhabitants of the region as a gift from the gods; it had descended from heaven, in fact. For the Sumerians, the protector of the kingship was the god Enlil, who was both the city god of Nippur and the ruler of the earth. For the Babylonians, on the other hand, the guardian of the kingship was Marduk, a god who had no role in the religious tradition of Mesopotamia. Even in the Old Babylon period, around 1800 BCE, during the reign of Hammurabi, Marduk was not only seen as the poliad god of the city, but also the controller of the kingship of the Babylonian sovereigns. There was nothing new in terms of the religious and political situation in Mesopotamia; just as in the past, local rulers received their sovereign powers from their own city god. The problem occurred when one city tried to predominate over the others; only then was it necessary to resort to the god of the earth, Enlil, the god of Nippur, to be invested with sovereignty.

Later too, in the Middle Babylonian period, around 1100 BCE, it is still Marduk who conferred the kingship on the Babylonian sovereigns. In the New Babylonian period (c. sixth century BCE) the position changed: Babylon wanted to become the political center of the whole of Mesopotamia, and Marduk was sufficient in stature to secure such an expectation. Yet, the rulers of Babylon called Marduk "ruler of all the gods," "source of the kingship." What happened in the preceding centuries? Did a religious revolution occur, so that no one could accuse the kings of Babylon of blasphemy? In fact, Babylonian scholars devised a new myth, reintegrating the theology that underpinned Babylonian hegemony in the religious and political environment of ancient Mesopotamia.

The prologue to the Code of Hammurabi provides information on the Babylonian pantheon: the gods were subdivided into two categories, the Anunnaki and the Igigi, who were respectively the greater and lesser gods. Anu, Enlil, and Enki, the supreme triad, clearly belonged to the Anunnaki, together with the classical divinities of the Sumerian world, and Marduk was part of the second group, the Igigi; in the prologue he is called "firstborn of Enki" and "leader of the

Igigi." Yet, this description shows that we are still a long way from the moment when Marduk, following his actions in the *Enuma elish*, became the new head of the Babylonian pantheon.

In the myth of Atrahasis, too, the pantheon is divided in two, the Anunna and the Igigi; the triad Anu, Enlil, and Ea belongs to a group of seven, the greater gods, whereas the Igigi, the lesser gods, are obliged to put up with the burden of hard work. The roles that they are given are the same as those assigned by the Sumerians, so the change has not yet taken place. (It is interesting that the god Marduk is not mentioned once in the myth of Atrahasis.) The Sumerian religion was still very much alive in the period that followed, and any radical change of a religious nature would have had enormous difficulty in being accepted.

ENUMA ELISH. The situation is completely different in *Enuma elish* (end of the second millennium BCE), the greatest religious poem of Babylonian literature. The scribes had grasped that there were two possible ways to elevate their poliad god to a central position in the pantheon: either to link Marduk to the god of Nippur or—certainly more subtle—to relate him to the god Enki. It may be surprising that they chose to establish a father-son relationship between Enki and Marduk, since the latter had never historically guaranteed the kingship, but the choice of the scribes shows a quite remarkable intelligence: they wanted to overturn historical reality and turn it to something of universal significance.

All of the Sumerian traditions assigned the position of principal god in their pantheon to Enlil, but at the same time they emphasized that the first seat of the kingship before the Flood was the city of Eridu, the home of the god Enki, who was therefore regarded as the first holder of royal power on earth. Hence the decision of the scribes to make Marduk the son of Enki. Their syllogistic reasoning is clear: if Enki the king is Marduk's father, then Marduk becomes the king. And that is not all: if Eridu is the home of Enki and at the same time the location of his kingship, then Babylon, the home of Marduk, is automatically the one true location of the kingship. So when we read the words of Berosus, that the first royal capital on earth was Babylon, we begin to understand how convincing the syllogism devised by the scribes of Babylon had become for later generations.

To make such a revolutionary idea acceptable, those responsible for creating the poem *Enuma elish* were obliged to confront subjects never dealt with by mythological texts of the preceding period. The seven tablets on which the poem is set down refer back to the primordial world, to the beginning of everything, which preceded the present cosmos. Thus they began the tale in the time before the birth of the sky god An, the future head of the Sumerian pantheon. The description of the situation that preceded the birth of the god of the sky was completely new, even if it may have been indirectly reconstructed from known sources. First of all, there existed only the primordial waters, the sweet and salt waters,

Apsu and Tiamat. These two beings joined in marriage and produced pairs of completely shadowy beings, until the couple Anshar and Kishar brought forth the god of the sky, An. The text then goes on to describe the generation of the god Enki and his son Marduk, thus ensuring that Marduk is given a definite place in the Mesopotamian pantheon.

Yet the priestly scribes went still further. They were anxious to install the Babylonian god in a leading position, and they accomplished their task in a most admirable way. Marduk could only become the ruler of the gods if he performed some quite exceptional act. The facts are quickly set out: the young gods were disturbing the rest of the primordial gods with their noise, so Apsu became angry and intended to punish them. Tiamat, their mother, did not want the young gods to die—they were still her children, after all—but Apsu was unyielding. The younger generation, led by An and Enki, refused to accept the decision of Apsu, and Enki killed his grandfather by trickery. At this, Tiamat declared all-out war on the entire set of young gods and there ensued a cosmic battle setting the old generation against the new. The forces of the primordial gods were led by Tiamat herself, and on Enki's advice, the task of commanding the young gods' army was given to Marduk. After various ups and downs, Marduk was victorious over Tiamat, thus doing away with the power of the primordial gods; only then did the gods unanimously agree to make Marduk their leader. The tale goes on to detail all of Marduk's actions, including the creation of the present cosmos with the constellations and planets (especially the sun and the moon), the setting up the calendar, and the foundation of Babylon, the new capital of the world.

The revolutionary idea underlying this poem should not be underestimated: all religious thinking had to be revised, and yet the Babylonian scribes did not actually omit anything from the religious situation. Among the Sumerian literary texts copied in the schools of Babylon, a prominent place was given to lists of Mesopotamian gods handed down from the Sumerians, but here an innovation occurred in the drafting of the texts: the divinities were subject to a great theological reworking that organized all the gods into a well-defined family structure—that is, into a pyramid with Marduk at its head, as a result of his victory over Tiamat. Not one of the great Sumerian gods was ousted—not An, nor Enlil, nor Enki—and they are the ones who elevate the young god and choose him as their undisputed new leader.

OTHER BABYLONIAN RELIGIOUS LITERATURE. We would be mistaken, however, if we thought that the Babylonians stopped at what we might term institutions. The ancient scribes believed, as we do, that ideas are truly revolutionary when they are popularly accepted. The mythological texts were accompanied by wisdom texts in which the scribes dealt with the problem of humanity, its suffering, its pain, and its eventual death. Although they recognized various solutions, the scribes directed their response towards the god Marduk. The poem *Ludlul bĒl nĒmeqi* is a document of unusual beau-

ty which puts forward Marduk as the true savior of every human being. Similarly, individual prayers rediscovered in the libraries of Babylon, as well as all the theophoric onomastics (names made up of divine constituent parts), provide irrefutable evidence that the cultural mission undertaken by the theological schools had been spread amongst the populace, and had become a fundamental idea within Babylonian culture.

If we turn our attention to the plan devised by the Babylonians to attain supremacy, which they would not be able to gain through political means, we see a genuine religious and intellectual revolution brought about by some exceptional minds. Precisely because Babylon was a city that had been recently founded, the learned priests of Marduk, the supreme god of Babylon, needed to find some means of incorporating their city and their god in his proper position in the primordial world from which their civilization had developed, and from which the kingship had originated. In the religious and historical texts of the Sumerians, the first inhabitants of Mesopotamia, we find a quite precise list of the order in which the first cities were founded and power was given to mankind by the gods. Even the divine world is duly ordered, with the principal gods, Anu, Enki, Enlil, and Inanna, allotted their specific roles and tasks, so that the world is organized and unchanging. At that time, Babylon did not yet exist, so later Babylonian priests needed to find a way for their city and their god to re-enter the Sumerian schema, or Babylon would share the same fate as many other cities, such as Ashur and Nineveh—powerful politically, but completely irrelevant in the intellectual and religious spheres. Of course, the priests of Marduk had one weapon on their side, and that was the actual ancestry of the god himself. Marduk was indeed the son of Enki, the Sumerian god of wisdom and one of the four main Sumerian gods, and thus it was in principle possible to link him with the existing Sumerian traditions, so that he could enter fully into a cultural framework from which newcomers had been excluded.

In *Marduk, the Heir of Enki*, there is clearly a subtle change in the Sumerian tradition which the Babylonian priests referenced: Enki is the creator of the human race and organizes the world, but he is also the father of Marduk. This is highly significant, because it is not only Marduk, but also Babylon that is elevated to the status of legitimate heir to Sumerian civilization, the first civilization in Mesopotamia. Marduk, as creator of the human race, is also the guardian of the kingship, of the exercise of power, which he grants to whomsoever he chooses, but in his chosen city, and thus Babylon becomes the legitimate home of the kingship. In the festival of the New Year the god Marduk solemnly renews his choice of the Babylonian sovereign and once again grants his trust to the shepherd of his people.

In the Babylonian schools a plan was set in motion to rework all previous knowledge, both religious and secular. Thus Babylon became the repository of Mesopotamian learning, once again invoking the divine world. Marduk has

a son, the god Nabu, heir to the knowledge and wisdom of his grandfather Enki; Nabu oversees all intellectual endeavor and is the patron of the prestigious class of scribes.

AKKADIAN LITERATURE. The mythological texts of Assyro-Babylonian literature are in fact a product of the Semitic people who replaced the Sumerians around 2000 BCE, and correctly identified with the large-scale migration there of the Amorites, who were able to create new dynasties and a new series of capitals, such as Babylon in the south and Ashur in the north. As early as the start of the Old Babylonian period there was sudden, intense literary activity which was faithful to tradition, in particular regarding the role of the principal triad An, Enlil, and Enki/Ea, but which also included a number of properties and personalities with characteristics that appear to be the product of exclusively Semitic thinking. For the typical nature of Sumerian civilization, which adapted to the dictates of the divine world without a murmur, there was substituted a much more typically Semitic character that was rebellious and in a certain sense inimical to the preordained plan of the divine world. There is sympathy for the view that the Semitic scribes expressed a way of thinking that was different and perhaps also at variance with the norm, in certain verses giving their assessment of cosmic and human reality.

Some historians of Akkadian literature stress that the Assyro-Babylonians needed several hundred years to produce literary and mythological compositions, which reached the height of the works created by the Sumerians. This conclusion is probably incorrect, as shown by the myth of Atrahasis, already in existence in the Old Babylonian period, at the beginning of settlement in Mesopotamia by the Semitic Amorites. Of course, until 1966, the Old Babylonian version of this myth was not known, because it was buried in the vaults of the British Museum. However, there were already sufficient other literary texts providing evidence of the literary maturity of the Babylonian scribes to prevent this kind of mistake.

In addition to the myth of Atrahasis, which had a long tradition and reworking that lasted until the New Babylonian period, we should recall the following as definitely attributable to the same period of Hammurabi: the myth of Etana, the myth of Ninurta and Anzu, the myth of Adad and the dragon, *Belet-ili and Lillu*, and the first draft of the *Epic of Gilgamesh*. Naturally, successive periods saw the reworking of these myths, along with the editing and composition of new myths, such as, for example, the *Descent of Ishtar to the Underworld* and *Nergal and Ereshkigal*, and in the Neo-Assyrian period there were the wonderful compositions of *Enuma elish* and the myth of Erra, which reached new and unequalled literary heights. Other texts that are considered mythological include the series of incantations that have introductory passages which refer to cosmological or human events (as well as serving as introductions to the actual spells themselves). There are also various hymns to divinities that allude to events which are, in the true sense of the word, mythological.

In conclusion, then, it can be stated that Akkadian mythology was certainly not in any sense inferior to Sumerian, and indeed was at least its equal, if not somewhat superior on account of its underlying distinctive, dynamic, and vigorous nature.

Translated from Italian by Paul Ellis

MESOPOTAMIAN RELIGIONS: HISTORY OF STUDY

The study of ancient Mesopotamian religions, like the study of ancient Mesopotamia in general, was severely hampered in its early phases by an imperfect understanding of Sumerian and Akkadian, the languages of its source materials, and by the relatively limited and fragmentary nature of the materials then available. To some extent, similar difficulties still exist, and new finds as well as new insights may challenge even seemingly assured results.

GENERAL PRESENTATIONS. The earliest attempt at a comprehensive presentation of ancient Mesopotamian religions is François Lenormant's *La magie chez les Chaldéens et les origines accadiennes* (1874). Lenormant posited an early Sumerian (then called Akkadian) animistic stage of belief in spirits that were controlled by magicians. Contrasting with this was the religion of the Semitic inhabitants (now called Akkadians), a debased form of monotheism in which hypostases of the supreme god, called Ilu, had become separate powers in natural phenomena, especially astral phenomena. These two competing kinds of beliefs were eventually unified into a single system under Sargon of Akkad, whom Lenormant dated at about 2000 BCE. Part of this systematization included the ordering of local deities into the later pantheon.

The next major contribution to the study of Mesopotamian religions, and one of a wider scope, was A. H. Sayce's *Lectures on the Origin and Growth of Religions as Illustrated by the Religion of the Ancient Babylonians* (1887). Sayce's book deals with various Babylonian deities, such as Bel-Merodakh (Marduk), Tammuz, and Istar (Ishtar), among others. He also discusses what he called "the sacred books of Chaldea," as well as cosmogonies and astro-theology. Sayce saw evidence of totemism in the animal forms that many of the gods could assume. Because Prometheus brought fire to man, Sayce saw him as a parallel to the deity Lugalbanda ("fierce king"). In his overall view of religious development, Sayce essentially followed Lenormant.

The Sumerian beliefs in spirits that were controlled by a body of medicine men was termed by Sayce "organized animism." The Sumerian word for spirit was thought to be *zi*, and "the *zi* was simply that which manifested life, and the test of the manifestation of life was movement" (p. 327). The spirits in those major cosmic elements that were considered good gradually developed into gods. The level of power of motion possessed by an object, or in a force of nature, was the test of its supernaturalism (that is, of the existence of a spirit within it). Sayce writes:

The spirit of the moon, for example, developed into a god, but the god was abstracted from the visible moon itself, and identified with the creative force of the lunar orb which manifested itself in motion. The new god might in turn be abstracted from the creative force, more especially if he was assimilated to the sacred steer; in this case the creative force would become his spirit, in no way differing, it will be seen, from the spirit that was believed to reside in man. (p. 334)

Sayce attributed to the Semitic-speaking Akkadians a change from the gods as creators to the gods as fathers, a change encouraged by anthropomorphism and the creation of a family-based pantheon.

In his later *Religions of Ancient Egypt and Babylonia* (1902), Sayce modified his position and rejected the idea that the gods might have developed out of older spirits. He assumed instead that the idea was brought in by immigrants from the south, who founded a tradition centered on the god Ea of the ancient city of Eridu.

Much more comprehensive than any previous treatment was Morris Jastrow's *The Religion of Babylonia and Assyria* (1898). Jastrow discusses the land and peoples of Babylon and Syria, the general traits of the Old Babylonian pantheon, the gods and their consorts prior to the days of Hammurabi, the pantheon of Hammurabi, Gudea's pantheon, and the minor gods in the period of Hammurabi. The book also deals with the gods appearing in temple lists and in legal and commercial documents of the area. Other topics that Jastrow investigates rather extensively are the animism that survived in Babylonian religions, the Assyrian pantheon, the triad and the combined invocation of the deities, the Neo-Babylonian period, and the Babylonian cosmology. Jastrow's work also examines the religious literature—magical texts, prayers and hymns, penitential psalms, oracles, omens, the *Epic of Gilgamesh*, and other myths and legends. There is also a discussion of the Babylonian view of life after death, and of the temple and cult in Babylonia and Syria.

Because Jastrow avoided theorizing as much as possible, his treatment is sober and descriptive. He also deliberately avoided distinguishing Sumerian from Akkadian contributions. Jastrow argued that animism was still basic to the religion of Babylonia and Assyria, and he observed that the gods had evolved from their role as spirits of the settlement plots. As these settlements grew into cities, the spirits grew correspondingly in stature and importance. The detailed bibliography of the field up to 1898 that Jastrow included in his book is particularly valuable. A later work by Jastrow, *Die Religion Babyloniens und Assyriens* (1905–1912), although never completed, is essentially a lengthy study of divination texts.

To the third edition of *Die Keilinschriften und das Alte Testament* (1903), which was edited by Eberhard Schrader, the German Assyriologist Heinrich Zimmern contributed his study *Religion und Sprache*, discussing the religious system of the Babylonians; the formation of the pantheon; local cults; the Semitic and Sumerian elements still evident in Babylonian religion; the Babylonians' reliance on the heavens in the formation of beliefs, practices, and myths; and the Babylonian view of life. Zimmern's presentation was strongly influenced by the school of *Astralmythologie* that flourished in Germany at the time, so an overabundance of gods were seen as solar in character. For example, Marduk was said to represent the sun of morning and spring; Ninurta (whose name was then read as Ninib) represented the eastern or western sun; the destructive glowing south, noon, and summer sun were represented by Nergal; and so on. The purview of the book called for comparisons with biblical materials (twenty-one pages were devoted to a comparison of Marduk and Christ), but the methods used have since been discounted.

In 1910 Édouard Dhorme's *La religion assyro-babylonienne* was published; the materials are organized with such clarity and relevance that the book remains one of the most notable early treatments of Mesopotamian religions.

Dhorme's work focused on the sources of the Assyrian and Babylonian religions and their conception of the divine, including the gods, gods of the cities and of kings, gods and men, moral laws, prayers, sacrifice, and the priesthood. A new, enlarged edition was published in 1945 under the title *Les religions de Babylonie et d'Assyrie*. Although it achieved a far greater coverage of detail, it lost the enlightening clarity that characterizes the earlier work.

A most useful, purely factual, and well-documented presentation was given by Bruno Meissner in the second volume of his *Babylonien und Assyrien* (1925). For ready access to the main data of pantheons, cults, divination, and magic, it remains unrivaled.

Jean Bottéro, in his *La religion babylonienne* (1952), sought to present the development of Babylonian religion among the Semitic-speaking inhabitants of Mesopotamia during the last two millennia before the Common Era. The work is marked by a great sensitivity and respect for the ancient achievement. A few of the subjects Bottéro discusses are deserving of special mention: religious sentiment, the theology of the divine, and cults of adoration and sacrament. His method of treatment is reminiscent of what is known as the phenomenology of religion.

A different approach, one that belongs to the Myth and Ritual school, is represented by S. H. Hooke's *Babylonian and Assyrian Religion* (1953), a well-written and very readable account of the essentials of its subject that is free of any extreme positions. Other general presentations include L. W. King's *Babylonian Religion and Mythology* (1899), Giuseppe Furlani's *La religione babilonese e assira* (1928–1929), Charles F. Jean's *La religion sumérienne* (1931), Hans Hirsch's *Untersuchungen zur altassyrischen Religion* (1961), and W. H. P. Römer's article "Religion of Ancient Mesopotamia" in *Historia Religionum*, volume 1, *Religions of the Past*, edited by C. Jouco Bleeker and Geo Widengren (1969). Also important are J. van Dijk's "Sumerische Religion" and Jørgen Laessøe's "Babylonische und assyrische Religion," in volume 1 of *Handbuch der Religionsgeschichte*, edited by Jes P. Asmussen, Jørgen Laessøe, and Carsten Colpe (1976). In this, as well as in other works, van Dijk refers to Eliade's phenomenological approach.

Thorkild Jacobsen's *The Treasures of Darkness: A History of Mesopotamian Religion* (1976) is a pivotal study of Mesopotamian religion. Jacobsen based this work on Rudolf Otto's theory on numinous experience, but when he set that theoretical approach in the history of Mesopotamia, he gave the book an evolutionist structure, a structure that is, however, absent in his entry "Mesopotamian Religion" in the first edition of this encyclopedia. Jacobsen provides an overall reconstruction of the poems describing the love and death of Dumuzi and Inanna, and he discusses a pre-urban historical phase, a period when the village communities were struggling to survive and the gods were conceived as providers (as stated in the title of Chapter 2 in *Treasures of Darkness*). With the development of urban life, the gods became rulers

in a society living in a state of endemic war. The book also includes important insight into personal religion, the epic of Gilgamesh, and the apotheosis of Marduk.

General presentations that appeared after Jacobsen's work include Helmut Freydanck's "Religion Mesopotamiens" in *Kulturgeschichte des alten Vorderasien*, edited by Horst Klengel (1989); Joaquín Sanmartín's "Mitología y Religión" in *Mitología y Religión del Oriente Antiguo*, edited by Gregorio del Olmo Lete (1993); and Jean Bottéro's *Plus vieille religion en Mésopotamie* (1998), translated into English by Teresa L. Fagan as *Religion in Ancient Mesopotamia* (2001).

SPECIAL STUDIES. As important as the general presentations on ancient Mesopotamian religions are, a wealth of special studies are in many cases even more essential for understanding these religions' major aspects. Unfortunately, considerations of space do not allow any comprehensive and systematic treatment; it is only possible to comment on a somewhat random and necessarily subjective selection.

The nature of the concept of divinity in Mesopotamia is treated in Johannes Hehn's *Die biblische und die babylonische Gottesidee* (1913) and in Elena Cassin's *La splendeur divine: Introduction à l'étude de la mentalité mésopotamienne* (1968). Rich in materials is Knut Tallquist's *Akkadische Götterepitheta* (1938). For discussion of the pantheon, Anton Deimel's *Pantheon Babylonicum* (1914) and part one of his *Sumerisches Lexikon*, volume 4, *Pantheon Babylonicum* (1950), are still standard references.

The origins and development of the pantheon were dealt with by Tharsicius Paffrath in his book *Zur Götterlehre in den altbabylonischen Königsinschriften* (1913) and by W. G. Lambert in his article "The Historical Development of the Mesopotamian Pantheon: A Study in Sophisticated Polytheism" in *Unity and Diversity*, edited by Hans Goedicke and J. J. M. Roberts (1975).

A representative collection of myths and epics in translation may be found in *Ancient Near Eastern Texts Relating to the Old Testament* (3d ed., 1969), edited by J. B. Pritchard. Thorkild Jacobsen's *The Harps That Once—Sumerian Poetry in Translation* (1987) translates a selection of significant religious poems from the Sumerian, and Stephanie Dalley's *Myths from Mesopotamia* (1989) does the same for Akkadian. Jean Bottéro and Samuel Noah Kramer's *Lorsque les dieux faisaient l'homme* (1989) includes translations of almost all the Sumerian and Akkadian mythological poems.

Treatments of mythology include Samuel Noah Kramer's *Sumerian Mythology* (1944; rev. ed., 1972); D. O. Edzard's article "Mesopotamien," in the first volume of *Wörterbuch der Mythologie*, edited by H. W. Haussig (1965); Giorgio R. Castellino's *Mitologia Sumerico-Accadica* (1967); and Alexander Heidel's *The Babylonian Genesis* (1942; 2d ed., 1963) and *The Gilgamesh Epic and Old Testament Parallels* (1949; 2d ed., 1963).

Aspects of the daily cult are the focus of Agnès Spycket's book *Les statues de culte dans les textes mésopotamiens* (1968).

Other books of interest include Friedrich Blome's *Die Opfermaterie in Babylonien und Israel* (1934) and Yvonne Rosengarten's *Le concept sumérien de consommation* (1960). For the times of the annual festivals, there is Benno Landsberger's magisterial (and still standard) work, *Der kultische Kalender der Babylonier und Assyrer* (1915). The *raison d'être* of the festivals was first clarified by Svend Aage Pallis in his book *The Babylonian Akitu Festival* (1926). Of crucial importance because it dismissed once and for all some serious misunderstandings of the Akitu is Wolfram von Soden's article "Gibt es ein Zeugnis dafür das die Babylonier an die Wiederauferstehung Marduks geglaubt haben?" (Is there any proof that the Babylonians believed in the resurrection of Marduk?), which appeared in *Zeitschrift für Assyriologie* 51 (1955). Beate Pongratz-Leisten's *Ina Šulmi Irub* (1994) examines textual material on the Akitu festival. *Ritual and Sacrifice in the Ancient Near East*, edited by J. Quaegebeur (1993), offers additional insights into this topic. Thorkild Jacobsen's "Religious Drama in Ancient Mesopotamia" in *Unity and Diversity*, edited by Hans Goedicke and J. J. M. Roberts (1975), gives a general treatment of festival rites.

Rites of divine journeys are treated in *Nanna-Suen's Journey to Nippur*, edited by A. J. Ferrara (1973), and in Daniel David Reisman's Ph. D. dissertation, "Two Neo-Sumerian Royal Hymns" (University of Pennsylvania, 1969). Royal inauguration rituals are discussed in Karl Friedrich Müller's *Texte zum assyrischen Königsritual* (1937), which is the first volume of his *Das assyrische Ritual*. Ritual meals are treated in Rintje Frankena's *Takultu: De sacrale maaltijd in het Assyrische ritueel* (1954).

The religious aspects of kingship are the subject of René Labat's *Le caractère religieux de la royauté assyro-babylonienne* (1939) and of Henri Frankfort's *Kingship and the Gods* (1948). An interesting strand in the fabric of kingship is treated in Ilse Siebert's *Hirt, Herde, König* (1969). To this research must be added the important articles by Å. Sjöberg, "Die göttliche Abstammung der sumerisch-babylonischen Herrscher," *Orientalia Suecana* 21 (1972); Piotr Michalowski, "History as Charter: Some Observations on the Sumerian King List," *Journal of the American Oriental Society* 103 (1983); and Claus Wilcke, "Genealogical and Geographical Thought in the Sumerian King List," in *Studies in Honor of Å. Sjöberg*, edited by Erle Leichty (1989).

Communal laments are covered in Raphael Kutscher's book *Oh Angry Sea (a-ab-ba-hu-luh-ha): The History of a Sumerian Congregational Lament* (1975). Penitential psalms are the focus of Julian Morgenstern's *The Doctrine of Sin in the Babylonian Religion* (1905), Walter Schrank's *Babylonische Sühnrates* (1908), Walter G. Kunstmann's *Die babylonische Gebetsbeschwörung* (1932), and Geo Widengren's *The Accadian and Hebrew Psalms of Lamentation as Religious Documents* (1936) and *Hymnes et prières aux dieux de Babylonie et d'Assyrie* (1976). Excellent translations may be found in Adam Falkenstein's *Die Haupttypen der Sumerischen Beschwörung literarisch untersucht* (1931). An updated study of the

rich material on this topic has been accomplished by Werner Meier, *Untersuchungen zur Formensprache der babylonischen "Gebetsbeschwörungen"* (1976).

Divination is treated in Georges Conteneau's *La divination chez les Assyriens et les Babyloniens* (1940) and C. J. Gadd's *Ideas of Divine Rule in the Ancient Near East* (1948). Important studies include Ivan Starr's *The Rituals of the Diviner* (1983), Ulla Jeyes's *Old Babylonian Extispicy* (1989), and Barbara Böck's *Die babylonisch-assyrische Morphoskopie* (2000). An overview of celestial divination can be found in Ulla Koch-Westenholz's exhaustive *Mesopotamian Astrology: An Introduction to Babylonian and Assyrian Celestial Divination* (1995).

On magic, L. W. King's *Babylonian Magic and Sorcery* (1896) and B. A. van Proosdij's *L. W. King's Babylonian Magic and Sorcery* (1952) are joined by the pivotal study by Erica Reiner, *Astral Magic in Babylonia* (1995). Studies of exorcistic traditions include Markham J. Geller's "Freud and Mesopotamian Magic," in *Mesopotamian Magic*, edited by Tzvi Abusch and Karel van der Toorn (1999), and Tzvi Abusch's *Mesopotamian Witchcraft: Toward a History and Understanding of Babylonian Witchcraft Beliefs and Literature* (2002). The subject of wisdom has been comprehensively treated in W. G. Lambert's *Babylonian Wisdom Literature* (1960).

In Mesopotamian thought, the cosmos were conceived of as a unity in which the gods, the impersonal powers, and all the realities of the tangible world were a part. Aspects of this cosmology are investigated in the seminal study by Jean Bottéro, "Le noms de Marduk, l'écriture et la 'logique' en Mesopotamie ancienne," in *Ancient Near Eastern Studies in Memory of J. J. Finkelstein*, edited by Maria de Jong Ellis (1977), and developed in his *Mésopotamie: L'écriture, la raison, et les dieux* (1987), translated into English by Zainab Bahrani and Marc Van De Mierop as *Mesopotamia: Writing, Reasoning, and the Gods* (1992).

Connections between writing and speculative thought have been investigated by Alasdair Livingstone, *Mystical and Mythological Explanatory Works of Assyrian and Babylonian Scholars* (1986); Antoine Cavigneaux, "Aux sources du Midrash: l'herméneutique babylonienne," in *Aula Orientalis* 5 (1987); Paul-Alain Beaulieu, "New Light on Secret Knowledge in Late Babylonian Culture," in *Zeitschrift für Assyriologie* 82 (1992), and "Theological and Philological Speculations on the Names of the Goddess Antu," in *Orientalia* 64 (1995); Morgen Trolle Larsen, "The Mesopotamian Luke-warm Mind: Reflections on Science, Divination, and Literacy," in *Language, Literature, and History: Philological and Historical Studies Presented to Erica Reiner*, edited by Francesca Rochberg-Halton (1987); Dietrich Otto Edzard, "La vision du passé et l'avenir en Mésopotamie," in *Histoire et conscience historique dans les civilisations du Proche-Orient Ancien* (1989); Piotr Michalowski, "Mental Maps and Ideology: Reflections on Subartu," in *The Origin of Cities in Dry-Farming Syria and Mesopotamia in the Third Millennium B.C.*, edited

by H. Weiss (1986); Bent Alster, "Dilmun, Bahrain, and the Alleged Paradise in Sumerian Myth and Literature," in *Dilmun: New Studies in the Archaeology and Early History of Bahrain*, edited by Daniel I. Potts (1983); Jean-Jaques Glassner, "La philosophie mésopotamienne," in *L'univers philosophique I*, edited by A. Jacob (1989), and his more detailed "V. Religion sumérienne," in *Supplément au dictionnaire de la Bible*, edited by H. Cazelles, J. Briand, and M. Quesnel (2002); P. Michalowski, "Presence at the Creation," in *Lingerings over Words*, edited by T. Abusch et al. (1990); Pietro Mander, "General Considerations on Main Concerns in the Religion of Ancient Mesopotamia," *Studi in Memoria di P. L. G. Cagni*, vol. 2, edited by S. Graziani (2000).

The study by Simo Parpola, "The Assyrian Tree of Life: Tracing the Origin of Jewish Monotheism and Greek Philosophy," in *Journal of Near Eastern Studies* 52 (1993) deserves attention despite its problematic methodology. Thorkild Jacobsen's last work, "The Historian and the Sumerian Gods," in *Journal of the American Oriental Society* 114 (1994), is devoted to methodological approaches in which Jacobsen employs the concept of *epoché*, derived from Husserl's phenomenology.

For attempts to reconstruct the historical development of Mesopotamian religion, see Wilfred George Lambert, "Ninurta Mythology in the Babylonian Epic of Creation," in *Keilschriftliche Literaturen: Ausgewählte Vorträge der XXXII Rencontre Assyriologique Internationale*, edited by K. Hecker and W. Sommerfeld (1986); Claus Wilcke, "Politik im Spiegel der Literatur, Literatur als Mittel der Politik im älteren Babylonien," in *Anfänge politischen Denkens in der Antike*, edited by K. Raaflaub et al. (1993); and William W. Hallo, "Sumerian Religion," in *Kinattutu sha darati*, edited by A. F. Rainey et al. (1994).

Studies dedicated to the interpretation of anthropogenic mythology and concepts about the human condition and the universe include W. G. Lambert and A. R. Millard, *Atra-hasis: The Babylonian Story of the Flood* (1969); W. L. Moran, "Some Considerations of Form and Interpretation in *Atra-hasis*," in *Language, Literature, and History: Philological and Historical Studies Presented to Erica Reiner*, edited by F. Rochberg-Halton (1987); Anne Draffkorn Kilmer, "Speculations on Umul, the First Baby," in *Sumerological Studies in Honour of Samuel Noah Kramer*, edited by B. L. Eichler (1976), and "The Symbolism of the Flies in the Mesopotamian Flood Myth," in *Language, Literature, and History: Philological and Historical Studies Presented to Erica Reiner*, edited by F. Rochberg-Halton (1987); W. G. Lambert, "The Theology of Death," in *Death in Mesopotamia: Papers Read at the XXVIe Rencontre assyriologique internationale*, edited by B. Alster (1980); Isaac M. Kikawada, "The Double Creation of Mankind in Enki and Ninmah, *Atrahasis* I 1–351, and Genesis 1–2," in *Iraq* 45 (1983); W. G. Lambert, "The Pair Lahmu-Lahamu in Cosmology," in *Orientalia* 54 (1985), and "The Cosmology of Sumer and Babylon," in *Ancient Cosmologies*, edited by C. Blacker and M. Loewe (1975);

Marten Stol, *Birth in Babylonia and the Bible: Its Mediterranean Setting* (2000); and Karel van der Toorn, *Family Religion in Babylonia, Syria, and Israel: Continuity and Change in the Forms of Religious Life* (1996).

On the topic of the so-called personal god, see Jacob Klein, "'Personal God' and Individual Prayer in Sumerian Religion," in *Archiv für Orientforschungen-Beiheft* 19 (1982), and Brigitte Groneberg, "Eine Einführungsszene in der altbabylonischen Literatur: Bemerkungen zum persönlichen Gott," in *Keilschriftlichen Literaturen*, edited by K. Hecker and W. Sommerfeld (1985).

For information on specific topics in Mesopotamian religion see the entries in *Reallexicon der Assyriologie* (1932–1957) and *Dictionary of Deities and Demons in the Bible*, 2nd ed. (1999), edited by K. van den Toorn, B. Becking, and P. W. van der Horst. The published volumes of the proceedings of the Melammu Symposia deserve a particular mention: *Mythology and Mithologies*, edited by R. M. Whiting (2001) and *Ideologies as Intercultural Phenomena*, edited by A. Panaino and G. Pettinato (2003). Jeremy Black, Anthony Green, and Tessa Rickards's *Gods, Demons, and Symbols of Ancient Mesopotamia: An Illustrated Dictionary* (1992) is both accessible and accurate.

UNCERTAINTIES. The script and languages of ancient Mesopotamia continue to present great difficulties to the modern student. These are so serious that almost no translations of Akkadian texts made prior to the twentieth century can safely be taken at face value; they need to be checked by a competent Assyriologist. As for Sumerian, at present no consensus about basic features of writing and grammar exists, and translations of one and the same text may differ radically. Extreme caution is thus indicated.

Since the late 1970s, however, in spite of the many difficulties, many important religious texts in Sumerian and in Akkadian have been published. While not aimed at the non-specialist, this great mass of philological work does provide the essential basis for further knowledge.

Last but not least, important work has been published by scholars looking for patterns that show the influence on the Greek religious world. Outstanding studies include Geoffrey S. Kirk's *Myth: Its Meaning and Functions in Ancient and Other Cultures* (1970), and *The Nature of Greek Myths* (1974), Martin L. West's *Early Greek Philosophy and the Orient* (1971), and *The East Face of Helicon* (1997), and Walter Burkert's *Griechische Religion der archaischen und klassischen Epoche* (1977), and *The Orientalizing Revolution: Near Eastern Influence on Greek Culture in Early Archaic Age* (1992).

- MESSIANISM IN THE MUSLIM TRADITION
- SOUTH AMERICAN MESSIANISM

MESSIANISM: AN OVERVIEW

The term *messianism* is derived from *messiah*, a transliteration of the Hebrew *mashiah* ("anointed"), which originally denoted a king whose reign was consecrated by a rite of anointment with oil. In the Hebrew scriptures (Old Testament), *mashiah* is always used in reference to the actual king of Israel: Saul (1 Sm. 12:3–5, 24:7–11), David (2 Sm. 19:21–22), Solomon (2 Chr. 6:42), or the king in general (Ps. 2:2, 18:50, 20:6, 28:8, 84:9, 89:38, 89:51, 132:17). In the intertestamental period, however, the term was applied to the future king, who was expected to restore the kingdom of Israel and save the people from all evil.

At the same time, prophetic oracles referring to an ideal future king, though not using the word *messiah*, were interpreted as prophecies of this same eschatological figure. These passages include *Isaiah* 9:1–6 and 11:1–9, *Micah* 5:2–6, and *Zechariah* 9:9, and certain of the "royal" psalms, such as Psalms 2, 72, and 110. Precedence for this later conception lies in the royal ideologies of the ancient Near East, where the king played the role of the savior of his people: every new king was expected to bring fertility, wealth, freedom, peace, and happiness to his land. Examples are found both in Egypt and in Mesopotamia. The French scholar Édouard Dhorme, in his book *La religion assyro-babylonienne* (1910), quoted some texts indicating such expectations under the heading "The Messiah King."

JUDAISM. In the Judaism of the intertestamental period, messianic expectations developed in two directions. One was national and political and is most clearly set out in the pseud-epigraphic *Psalms of Solomon* (17 and 18). Here the national Messiah is a descendant of David. He shall rule in wisdom and righteousness; he shall defeat the great powers of the world, liberate his people from foreign rule, and establish a universal kingdom in which the people will live in peace and happiness. The same kingly ideal is expressed in the description of the rule of Simon in *1 Maccabees* 14:4, which echoes the messianic prophecies of the Old Testament.

Some apocryphal documents, especially the *Testament of Levi*, speak also of a priestly messiah, one who is to bring peace and knowledge of God to his people and to the world. The Qumran community even expected two anointed ones, a priest and a king, but very little is known about their functions.

The other line of development is found above all in the Ethiopic *Apocalypse of Enoch* (*1 Enoch*) and in *2 Esdras* (also

called *4 Ezra*). It centers around the term *son of man*. This term is used in the Old Testament to refer generally to a human being (*Psalms* 8:5, 80:18 [English version 80:17] and several times, addressing the prophet, in *Ezekiel*). In the vision recorded in *Daniel* 7, the term is used in verse 13 with reference to a "man-like being," which, in contrast to the usual four animals representing the four great powers of the ancient world, stands for Israel in its prominent role at the last judgment.

In the apocalyptic books mentioned, the son of man is a transcendental figure, more or less divine, preexistent, and at present hidden in heaven. At the end of time he will appear to judge the world in connection with the resurrection of the dead. The pious will be freed from the dominion of the wicked, and he will rule the world forever in peace and righteousness. He is often referred to as "the chosen One" but only occasionally as "the anointed One," that is, the Messiah. Obviously, this interpretation of *Daniel* 7:13 takes "son of man" to refer to a person and not to an object of comparison. The problem is the extent to which these passages are pre-Christian. *2 Esdras* was definitely written after the fall of Jerusalem in 70 CE, and those parts of *1 Enoch* in which references to the son of man occur do not appear among the Aramaic fragments of the same work found at Qumran. On the other hand, the New Testament seems to presuppose this same interpretation of *Daniel* 7:13.

CHRISTIANITY. Early Christianity took many of the Jewish ideas about the Messiah and applied them to Jesus. *Messiah* was translated into Greek as *Christos*, that is, Christ, thereby identifying Jesus with Jewish messianic expectations. Matthew interpreted *Isaiah* 9:1 (EV 9:2), "The people who walk in darkness shall see a great light," as fulfilled in Jesus (*Mt.* 4:14–18). *Micah* 5:1 (EV 5:2) is quoted to prove that the Messiah should be born in Bethlehem (*Mt.* 2:6). *Zechariah* 9:9 is read as a prediction of Jesus' entry into Jerusalem (*Mt.* 21:5), and if the story related by Matthew is authentic, it must mean that Jesus wanted to proclaim himself as the Messiah. *Psalms* 2:7 ("You are my son") is quoted or at least alluded to in connection with the baptism of Jesus (*Mt.* 3:17, *Mk.* 1:11, *Lk.* 3:22). (The Jewish Messiah, however, was not regarded as God's son.) *Psalms* 110:1 is used to prove that the Messiah cannot be the son of David (*Mt.* 22:44); other parts of Psalm 110 are behind the exposition in *Hebrews* 5, 6, and 7. However, the New Testament rejects the political messiahship described in the *Psalms of Solomon*. Jesus refused to be made king (*Jn.* 6:15); he proclaimed before Pilate: "My kingdom is not of this world" (*Jn.* 18:26). Despite this, he was accused of pretending to be "the king of the Jews" (*Jn.* 19:19).

The New Testament, however, although maintaining that the Messiah is the Son of God, also uses the epithet "Son of man." According to the Gospels, Jesus uses it of himself. In a few cases it could possibly mean simply "a human being" or "this man" (*Mk.* 2:10, *Mt.* 11:8, and parallels; *Mt.* 8:20 and parallels). A number of passages refer to the coming of

the Son of man at the end of time (*Mt.* 24:27, 24:37; *Lk.* 18:18, 18:22, 18:69; *Mt.* 10:23; *Mk.* 13:26); these imply the same interpretation of *Daniel* 7:13 as that implied by *1 Enoch* and *2 Esdras* but add a new element in that it is Christ who is to come a second time, returning as the judge of the world. A third group of “Son of man” references allude to the suffering and death of Jesus, sometimes also mentioning his resurrection (*Mk.* 8:31, 9:9, 9:31, 10:33, 14:21, 14:41; *Lk.* 22:48 and others). These introduce the idea of a suffering messiah, which is not entirely unknown in Jewish messianism but is never linked with the Son of man. (If the latter is sometimes described in terms of the “servant of the Lord,” the chapter on the suffering servant, *Isaiah* 53, is never applied to him.) In the *Gospel of John* the Son of man is almost always the glorified Lord as king and judge; he is also described as preexistent in heaven (*Jn.* 1:51, 3:13, 8:28). *Hebrews* 2:6–8 applies Psalm 8, in which “son of man” was originally meant as “human being,” to Jesus, thus giving the expression an eschatological meaning.

A new feature was introduced in New Testament messianism by the identification of Jesus with the suffering servant of *Isaiah* 53. *Mark* 9:12 says that it “was written of the Son of man that he should suffer many things and be treated with contempt” (cf. *Is.* 53:3). *Acts of the Apostles* 8:32 explicitly quotes *Isaiah* 53:7–8 as fulfilled in Jesus, and *1 Peter* 2:22–24 quotes or alludes to parts of *Isaiah* 53 as referring to him. It would seem that this identification is an original creation of Jesus (or, possibly, of the early church).

Thus, New Testament Christology utilizes a great many traits drawn from Jewish messianism. At the same time, it adds a new dimension: the idea that Jesus, though he has already in person fulfilled the messianic expectations, is to return in order to bring them to their final fulfillment.

ISLAMIC MESSIANISM. Ideas comparable to that of the second coming of Christ are found in Islam, probably owing to Christian influence. While the Qurʾān envisages God as the judge on the Day of Judgment, later Muslim tradition introduces certain preparatory events before that day. Muḥammad is reported to have said that the last day of the world will be prolonged in order that a ruler of the Prophet’s family may defeat all enemies of Islam. This ruler is called the Mahdi, “the rightly guided one.” Other traditions say that he will fill the world with justice as it is now filled with wrong, an apparent echo of ancient kingship ideology. Some identify the Mahdi with Jesus (Arab., ʿIsā), who is supposed to appear before the end of the world to defeat al-Dajjāl (“the deceiver”), the false messiah, or antichrist. Such traditions were utilized by founders of new dynasties and other political or religious leaders, especially among the Shīʿah. The last such example was the rebel leader Muḥammad Aḥmad of Sudan, who from 1883 temporarily held back the British influence in this area.

“NATIVISTIC” MOVEMENTS. With some justification the concept of messianism is used to describe a number of “nativistic” cults in different parts of the world that have

emerged as the result of a clash between colonialist Christianity and native religions. Following Vittorio Lanternari (1965), however, a distinction should be made between messianic and prophetic movements. “The ‘messiah,’” he says, “is the awaited savior, the ‘prophet’ is he who announces the arrival of one who is to come. The prophet himself can be the ‘messiah’ after he has died and his return is expected as a redeemer, or when the prophet himself, leaning upon an earlier messianic myth, declares himself to be the prophet-messiah” (p. 242n.).

Examples of such movements are known from all parts of the aboriginal world. As early as the sixteenth century, successive waves of Tupi tribes in Brazil moved to the Bahia coast, impelled by a messianic quest for the “land without evil.” Another such migration to find the “land of immortality and perpetual rest” is reported to have inspired the Spaniards’ idea of El Dorado. Similar migrations took place in later centuries, led by a kind of prophet described as “Man-God” or “Demi-God,” that is, local shamans who came to the natives as religious leaders and reincarnations of the great mythical heroes of native tradition and announcing an era of renewal.

The Ghost Dance movement in the western United States was initiated in 1869 by a certain Wodziwob, who had visions through which the Great Spirit announced that a major cataclysm would soon shake the entire world and wipe out the white man. The Indians would come back to life, and the Great Spirit would dwell among them in the heavenly era. Wodziwob’s son, Wovoka (John Wilson), established contacts with the Mormons in 1892 and was considered by them to be the Messiah of the Indians and the Son of God.

In the Kongo region in Africa, Simon Kimbangu, who had been raised in the British Baptist Mission, appeared in 1921 as a prophet to his people. His preaching was a combination of Christian and indigenous elements. He prophesied the imminent ousting of the foreign rulers, a new way of life for the Africans, and the coming of a golden age. Both he and his successor, Andre Matswa, expected to return after death as the liberators of their people. Several movements of a similar kind are known from other parts of Africa.

In the early twentieth century, Melanesia and New Guinea saw the emergence of the so-called cargo cults. Common to them all is the belief that a Western ship (or even airplane), manned by whites, will come to bring riches to the natives, while at the same time the dead will return to life and an era of happiness will follow. Some prophets of these cults were regarded as incarnations of spirits.

It would seem that all these movements originated among people under oppression and gave expression to their longing for freedom and better conditions. Obviously, the conditions under which Christianity arose are somewhat comparable.

BIBLIOGRAPHY

The standard work for early Jewish messianism is Sigmund Mowinckel's *He That Cometh* (Oxford, 1956). Briefer, but including the Egyptian and Mesopotamian texts referred to in the article, is my book *The Messiah in the Old Testament* (London, 1956). A good introduction to the Son of man question is Carsten Colpe's article "Huios Tou Anthrōpou," in the *Theological Dictionary of the New Testament*, edited by Gerhard Kittel (Grand Rapids, Mich., 1972). See also Rollin Kearns's *Vorfragen zur Christologie*, 3 vols. (Tübingen, 1978–1982), and Maurice Casey's *Son of Man: The Interpretation and Influence of Daniel 7* (London, 1979). Islamic messianism has been dealt with most recently by Hava Lazarus-Yafeh in her book *Some Religious Aspects of Islam* (Leiden, 1981), pp. 48–57, and by Jan-Olaf Blichfeldt in *Early Mahdism* (Leiden, 1985). On Islam see also my article "Some Religious Aspects of the Caliphate," in *The Sacral Kingship* (Leiden, 1959). Edgar Blochet provides some early observations in *Le messianisme dans l'hétérodoxie musulmane* (Paris, 1903). A comprehensive survey of the millenarian movements is found in Vittorio Lanternari's *The Religions of the Oppressed* (New York, 1965). Lanternari's book includes a good bibliography.

HELMER RINGGREN (1987)
Revised Bibliography

MESSIANISM: JEWISH MESSIANISM

The term *messianism* denotes a movement, or a system of beliefs and ideas, centered on the expectation of the advent of a messiah (derived from the Hebrew *mashiah*, "the anointed one"). The Hebrew verb *mashah* means to anoint objects or persons with oil for ordinary secular purposes as well as for sacral purposes. In due course the nominative form came to mean anyone with a specific mission from God (i.e., not only kings or high priests), even if the anointing was purely metaphorical (prophets, patriarchs), and ultimately it acquired the connotation of a savior or redeemer who would appear at the end of days and usher in the kingdom of God, the restoration of Israel, or whatever dispensation was considered to be the ideal state of the world.

This specific semantic development was due to the Jewish belief that the ultimate salvation of Israel, though

wrought by God, would be presided over or realized by a descendant of the royal house of David. He, the "son of David," would be the Lord's anointed *par excellence*. From its original Jewish context the word *mashiah* then passed into general use, denoting movements or expectations of a utopian character or otherwise concerned with the salvation of society and the world. The messianic complex appears at times as restorative in character (the *Paradise Lost-Paradise Regained* syndrome), in the sense that it envisages the restoration of the past and lost golden age. At other times it appears as more utopian, in the sense that it envisages a state of perfection the like of which has never existed before ("a new heaven and a new earth"); the Messiah will not merely renew the days of yore but will usher in a "new age."

The term *mashiah* in this specific eschatological sense does not occur in the Hebrew scriptures. *Isaiah* 45:1 calls the Persian king Cyrus II the Lord's "anointed" because it was evidently as the chosen instrument of God that he permitted the Israelite exiles to return from Babylonia to Jerusalem. Using later terminology one may, perhaps, commit a technical anachronism and describe as "messianic" those scriptural passages that prophesy a future golden age, the ingathering of the exiles, the restoration of the Davidic dynasty, the rebuilding of Jerusalem and the Temple, the era of peace when the wolf will lie down with the lamb, and so on.

Such is the nature of messianism that it develops and flourishes in periods of suffering and frustration. When the present is satisfactory it need not be redeemed but should be perpetuated or renewed (e.g., by periodic or cyclical renewal rites). When the present is profoundly unsatisfactory, messianism emerges as one of the possible answers: the certainty of a satisfactory natural, social, and historical order (and this certainty was particularly strong in Israel, based as it was on God's promise enshrined in his eternal covenant) is projected on the horizon of an ideal future. As the biblical account amply shows, already in biblical times the present was generally perceived as far from satisfactory (wicked and sinful kings, enemy incursions, defeats), and hence ideas concerning an ideal order under an ideal Davidic king began to crystallize.

The tendency to look toward future fulfillment was reinforced by the destruction of the First Temple (587/6 BCE), the Babylonian exile, and the subsequent return to Zion under Cyrus, hailed by "Second Isaiah" as an event of a messianic order. But this "messianic" salvation proved a sad disappointment. The severe persecution under the Syrian Seleucid ruler Antiochus IV (r. 175–163 BCE) similarly led to messianic-eschatological hopes, as evidenced by the *Book of Daniel*, the composition of which is generally dated in that period. But the great salvation wrought by the victory of the Maccabees similarly proved, in the long run, a sad disappointment. The revolts against the oppressive "kingdom of wickedness," Rome in 65–70 CE (which ended with the destruction of Jerusalem and the Second Temple) and again in 132–135 CE (the Bar Kokhba Revolt, which ended in the

practical destruction of Palestinian Jewry) no doubt had messianic elements. Thereafter messianism was a mixture of firm and unshakable hope in ultimate redemption, on the one hand, and, on the other hand, fear of the dangers and disastrous consequences of messianic explosions—“messianic activism,” as the historian would call it, or “premature messianism,” as the theologian would call it.

The messianic doctrines that developed during the second half of the Second Temple period from approximately 220 BCE to 70 CE (also called the “intertestamentary” period) were of diverse kinds, reflecting the mentality and spiritual preoccupations of different circles. They ranged from this-worldly, political expectations—the breaking of the yoke of foreign rule, the restoration of the Davidic dynasty (the messianic king), and, after 70 CE, also the ingathering of the exiles and the rebuilding of the Temple—to more apocalyptic conceptions, such as the spectacular and catastrophic end of “this age” (including a Day of Judgment), the ushering in of a new age, the advent of the kingdom of heaven, the resurrection of the dead, a new heaven and a new earth. The main protagonist might be a military leader, a kingly “son of David,” a supernatural figure such as the somewhat mysterious “son of man” mentioned in some books of the Hebrew scriptures as well as in apocryphal apocalyptic texts. Many scholars think that Jesus deliberately avoided the use of the term messiah because of its political overtones (especially as he was announcing a kingdom that was not of this world) and preferred the unpolitical term “son of man.” On the other hand, those responsible for the final redaction of the *Gospel of Matthew* thought it necessary to provide Jesus with a lineage proving his descent from David in order to legitimate his messianic status, since the *mashiah* (Gr., *christos*) had to be identified as the “son of David.”

These examples, incidentally, also show that the origins of Christianity have to be seen in the context of the messianic ferment of contemporaneous Jewish Palestine. Messianic ideas developed not only by way of interpretation of biblical texts (e.g., the *pesher* of the Qumran community and the later *midrash* of rabbinic Judaism) but also by “revelations” granted to apocalyptic visionaries. The latter tradition is well illustrated by the last book of the New Testament, the *Book of Revelation*.

But messianic ideas and expectations could also be based on “rational” (i.e., nonvisionary) insights, especially when the interpretation of scriptural prophecies took the form of calculations and computations of the dates allegedly hinted at in the obscure symbolism of the texts. Jewish messianic enthusiasts would often base their calculations on the *Book of Daniel* (much as Christian millenarians would compute the end time from the “number of the beast” mentioned in *Revelation* 13:18). Since the high-pitched hopes generated by these calculations would often lead to disaster (or at best to severe disappointment), the Talmudic rabbis had very harsh words about “those who compute the [messianic] end.”

One tradition, probably influenced by *Zechariah* 3–4, appears to have held a doctrine of two messianic figures, the one a high-priestly “anointed one” of the house of Aaron, the other a royal messiah of the house of David. This belief, which was held by the Qumran community (also known as the Dead Sea Sect), obviously implies that these complementary messianic figures are not so much saviors and redeemers as symbolic types presiding over the redeemed and ideal social order. Echoes of this doctrine seem to be present in the (apparently polemical) insistence of the New Testament *Letter to the Hebrews* that Jesus was both king and high priest. The doctrine seems to have survived into the Middle Ages (by what channels is not quite clear), for it is found also among the Karaites.

Another version of the “double messiah” developed in the second century CE, possibly as a reaction to the catastrophic failure of the Bar Kokhba Revolt. The messiah of the house of Joseph (or Ephraim)—a possible echo of the motif of the ten lost tribes—falls in battle against the forces of Gog and Magog (the Jewish counterpart to the Battle of Armageddon). He is thus not a suffering messiah but a warrior messiah who dies a hero’s death, to be followed by the victorious messiah of the house of David. This view of a double messiah also expresses an essential duality in Jewish (but not only in Jewish) messianism: messianic fulfillment is preceded by cosmic, natural, and social upheavals and catastrophes. (The Christian transformation of the Jewish motif is the idea of the Antichrist let loose to rule the world before being finally vanquished at the Second Coming.) Hence, whenever severe sufferings and tribulations were visited on the Jewish people, these could be, and often were, interpreted as the predicted pre-messianic catastrophe (the “birth pangs” of the messianic age, in the language of the Talmud) heralding an imminent messianic consummation.

Messianism in the wider sense of an ideal future need not imply the belief in a particular, individual savior or redeemer figure. While *Isaiah* 11 and 2:2–4 envisage a peaceful and utopian world under a Davidic king, the parallel text *Micah* 4:4 has even fewer miraculous elements and speaks of an earthly happiness, with every man dwelling under his vine and under his fig tree. For Jeremiah too, though his vision of the future also emphasizes the moral dimensions—compare *Jeremiah* 31:30ff. and 32:36–44 with Ezekiel’s “new heart” and “heart of flesh” instead of the previous heart of stone (*Ez.* 2:4, 11:19, 18:31, 32:9, 36:26)—the promised boon is that “there shall enter into the gates of this city [Jerusalem] kings and princes sitting upon the throne of David, riding in chariots and on horses” (*Jer.* 17:25). Noteworthy in this text is not only its this-worldly ideal, with Jerusalem as a bustling royal city, but also the reference to kings, in the plural. The idea of the *one* messianic savior-king had not yet developed.

In later, especially modern and secularized, versions of messianism, the idea of a personal messiah increasingly gave way to the notion of a “messianic age” of peace, social justice,

and universal love—conceptions that could easily function as progressive, liberal, socialist, utopian, and even revolutionary transformations of traditional messianism. Thus the Philadelphia program of American Reform Judaism (1869) substituted for the belief in a personal messiah the optimistic faith in the advent of a messianic era characterized by “the unity of all men as children of God in the confession of the One and Sole God,” and the Pittsburgh Platform (1885) spoke of the establishment “of the kingdom of truth, justice and peace.” Twentieth-century disillusionment with the idea of progress seems to have given a new lease on life to more radical and utopian forms of messianism.

In the intertestamentary period, messianic beliefs and doctrines developed, as we have seen, in a variety of forms. Messianism became increasingly eschatological, and eschatology was decisively influenced by apocalypticism. At the same time, messianic expectations became increasingly focused on the figure of an individual savior. In times of stress and crisis messianic pretenders (or forerunners and heralds announcing their advent) would appear, often as leaders of revolts. Josephus Flavius as well as the author of *Acts* 5 mentions several such figures. Moreover, the Messiah no longer symbolized the coming of the new age, but he was somehow supposed to bring it about. The “Lord’s anointed” thus became the “savior and redeemer” and the focus of more intense expectations and doctrines, even of a “messianic theology.” Compare, for example, the implications of Paul’s reading of *Isaiah* 52:20, “and the Redeemer [i.e., God] cometh to Zion,” as “the Redeemer [i.e., Christ] cometh from Zion” (*Rom.* 11:26).

Since many Jews of the Diaspora lived under Christian domination, which meant also Christian persecution and missionary pressure, theological polemics inevitably centered on christological—that is, messianic—themes. (Is Jesus the promised messiah? Why do the Jews refuse to acknowledge him? Because of carnal blindness or diabolic wickedness?) Since both religions recognized the Hebrew Bible as holy scripture, polemic often assumed an exegetical character (i.e., it claimed a correct interpretation of the “messianic” prophecies in the Bible). As a rule, Jewish messianism never relinquished its concrete, historical, national, and social expectations and was little impressed by the “spiritual” character of Christian doctrine.

Christian polemics, from the early church fathers to the Middle Ages and later, accused the Jews of an inferior and crude materialism that made them read the scriptures *kata sarka*, with eyes of flesh rather than with eyes of the spirit. Paradoxically, the Jews considered this reproach as a compliment, since for them the claim that the Messiah had come was, in an unredeemed world plagued by wars, injustice, oppression, sickness, sin, and violence, utterly meaningless. In the famous disputation of Barcelona (1263), forced upon the Jews by Dominican missionaries and held in the presence of King James I of Aragon, the Jewish spokesman, the great Talmudist and qabbalist Moses Nahmanides (Mosheh ben

Nahman, c. 1194–c. 1270), simply quoted *Isaiah* 2:4 and observed that His Most Christian Majesty, in spite of his belief that the Messiah had come, would probably find it difficult to disband his army and send home all his knights so that they might beat their swords into plowshares and their spears into pruning hooks.

Throughout Jewish history there has existed a tension between two types of messianism, already briefly mentioned before: the apocalyptic one, with its miraculous and supernatural elements, and a more “rationalist” one. Throughout the Middle Ages old, and usually pseudepigraphic, apocalypses and messianic *midrashim* were copied and new ones were produced by messianic enthusiasts and visionaries. The rabbinic attitude, at least the official one, was more sober and prudent: too many messianic outbursts had ended in disaster, namely, cruel suppression by the gentile rulers. A burned child dreads the fire, and the rabbinic hesitations (probably a result of the traumatic experience of the Bar Kokhba Revolt) found eloquent expression in the homiletic interpretation of *Song of Songs* 2:7: “I charge you, you daughters of Jerusalem, that you stir not up nor awake my love till he please”—this verse contains six charges to Israel: not to rebel against the kingdoms of this world, not to force the end of the days . . . and not to use force to return to the Land of Israel” (B. T., *Ket.* 111a). On a more theoretical level, already one Talmudic master had given the opinion that “there is no difference between this age and the messianic age but the oppression of Israel by the heathen kingdoms [which will cease after Israel regains its freedom under a messianic king].”

The great medieval authority, the philosopher-theologian Moses Maimonides (Mosheh ben Maimon, 1135/8–1204), although he enumerated belief in the advent of the Messiah among the basic articles of faith, was careful to rule in his legal code as follows:

Let no one think that the messianic king would have to perform signs or miracles . . . and let no one think that in the messianic era the normal course of things would be changed or the order of nature altered. . . . What scripture says on the subject is very obscure, and our sages [too] have no clear and explicit traditions in these matters. Most [of the prophecies and traditions] are parables, the real meaning of which will become clear only after the event. These details are therefore not articles of religion, and one should not waste time on their interpretation or on the computation of the date of the messianic advent, since these things are conducive neither to the love of God nor to the fear of God. (*Mishneh Torah*, Kings 11, 12)

In Maimonides’ own lifetime, messianic movements occurred in parts of the Diaspora, and as the acknowledged leader of his generation he had to do his best, without offending the messianic enthusiasm of the pious folk, to prevent disasters and backlashes by carefully preaching his more sober approach (e.g., in his *Epistle to Yemen* and *Epistle on the Resurrection of the Dead*). Nevertheless, messianic longing and apocalyptic imagination, fired by persecutions and suf-

fering, continued to flourish and to ignite messianic outbursts. There was no dearth of messianic pretenders (“pseudomessiahs”) or precursors announcing the advent of the Redeemer, provided the people would prepare themselves by appropriate means (e.g., penitential austerities).

But no matter whether messianic hopes and beliefs were apocalyptic or more sober, a matter of feverish agitation or of theological dogma, they had become an essential part of the Jewish faith and of the Jewish experience of life and of history. The apocalyptic texts might be rejected by some as too fantastic, but the heritage of messianic prophecy was accepted by all—not only in its biblical form but even more decisively in its subsequent rabbinic development. The most influential factor was, perhaps, the constant emphasis of messianic beliefs (the ingathering of the exiles, the restoration of the Davidic kingdom, the rebuilding of Jerusalem and the Temple) in the daily liturgy, in the grace recited after every meal, and especially in the prayers on Sabbath and holy days. This is not the only instance in the history of religions that illustrates how the prayer book and the liturgy can exert a more pervasive influence than theological tracts.

Messianic movements accompanied Jewish history throughout the Middle Ages, and there were probably many more than have come to our knowledge through chronicles, rabbinic *responsa*, and other incidental references. Most of them were local phenomena of short duration. The movement usually petered out after its suppression by the authorities or the disappearance (or execution) of the leader. In this respect the movement inspired by the seventeenth-century messianic pretender Shabbetai Tsevi is an exceptional case. Messianic movements are attested in Persia from the eighth century (Abū ‘Isā al-Isfahānī and his disciple Yudghan) to David Alroy (Menaḥem al-Dūjī) in the twelfth century. Abū ‘Isā, who proclaimed himself the messiah of the house of Joseph, duly fell in battle against the Abbasid forces against which he had marched with ten thousand followers, while David Alroy (known best from Disraeli’s fanciful novel) staged a revolt against the sultan. Several messianic pretenders appeared in the eleventh and twelfth centuries in western Europe, particularly in Spain. Later, under the influence of Qabbalah, messianic activism became more mystical and even magical. Spiritual activism, when all realistic and practical outlets are closed, easily becomes magical activism, and Jewish legend tells of masters who undertook to force the messianic advent by means of extreme mortifications, special meditations, and qabbalistic incantations. These legends, the most popular of which was that concerning Yosef della Reyna, usually end with the qabbalist adept falling prey to the demonic powers that he had sought to vanquish.

To understand the various messianic movements properly, one would have to examine carefully, individually, and in detail the specific historical circumstances and external pressures as well as internal tensions that precipitated them. The common fate of Jews everywhere as a despised and persecuted minority, existing in a hostile environment yet shar-

ing the same religious culture and messianic hope, provides a general framework; nevertheless it is clearly inadequate as an explanation of specific messianic movements. The permanent presence of messianic dynamisms is also attested by the phenomenon of smaller or larger groups of Jews leaving their countries of origin in the Diaspora in order to settle in the Holy Land. While less blatantly millenarian than the acute messianic outbursts, these movements often had messianic motivations. Although the Messiah had not yet appeared or called the faithful to the Promised Land, the motivation was often “preeschatological” in the sense that a life of prayer and ascetic sanctification in the Holy Land was thought to prepare or even hasten the advent of the Redeemer.

With the emergence of Qabbalah after the thirteenth century, and especially its development after the expulsion of Jews from Spain and Portugal, qabbalistic mysticism became a major element and driving social force in Jewish messianism. This process requires a brief elucidation. As a rule mystical systems have little or no relationship to time or to the process of time, history, and hence to messianism. After all, the mystic aspires to a supratemporal sphere, the anticipation of timeless eternity and the “everlasting now” rather than to the crowning consummation of history. It is therefore not surprising to find messianic tension decreasing in inverse proportion to the mystical tension. This principle seems to hold true also regarding classical Spanish Qabbalah. The new Qabbalah, Lurianic Qabbalah, that developed after the Spanish expulsion in the great centers of the Ottoman empire, but especially in Safad in the Holy Land, was remarkable for its high, one would almost say explosive, messianic charge, especially in the form that it received at the hand of the most original, charismatic, and outstanding qabbalist in that group, Isaac Luria (1534–1572).

Lurianic Qabbalah interpreted the history of the world in general, and Israel’s exile, suffering, and redemption in particular, in an idiom of a type that might be called gnostic, that is, in terms of a cosmic, or rather divine, drama in which God himself was involved. One might also describe the system as a theosophical *Heilsgeschichte*. According to this strangely “gnostic” myth, a primordial catastrophe or “fall” occurred—long before Adam’s original sin—at the moment when the divine light-essence externalized itself with a view to creating the world. The vessels that were to carry and transmit the divine light collapsed (the “breaking of the vessels”) and the divine light-sparks fell into chaos and have since been imprisoned and “exiled” there, where—and this is part of their tragedy—they sustain the life of the demonic realm.

Israel’s exile and suffering thus merely reflect on the historical, material, and external level the more fundamental mystery of the exile and suffering of the divine fallen sparks. Redemption thus means the liberation of the divine sparks from the defiling embrace of the demonic powers and their return to their divine source, no less than the liberation of Israel from subjugation to the Gentiles and its return to the

Holy Land. Indeed, the latter process would follow as natural consequence from the former, which it was Israel's true and mystical vocation to bring about by a life of piety and holiness. This is spiritual activism at its most extreme, for here God has become a *salvator salvandus*. To the harassed and hounded Jew, exile became meaningful because it was seen as a reflection of, and participation in, the profounder exile of God, and God himself required Israel's cooperation in the redemption of himself, his people, and his creation. It is not surprising that, at least at first, the personality of the Messiah played a relatively minor role in this system. He was not so much a redeemer as a sign and symbol that the mystical messianic process had been consummated. In fact, the messianic doctrine of Lurianism comes close, at least structurally, to an evolutionist scheme.

This qabbalistic system provided the background of one of the most remarkable messianic episodes in the course of Jewish history—the movement centered on the person of Shabbetai Tsevi. The ignominious debacle of Shabbateanism, with its aftermath of heresy, antinomianism, and apostasy, left a trail of spiritual confusion and disarray as a result of which both Qabbalah and messianism declined, at least in their public and social role. Apart from a few minor messianic convulsions, “automessianism” (as Martin Buber called it) declined steadily. The messianic idea remained alive in Judaism, influencing no doubt also non-Jewish ideologies of utopia and hope (see the influential work of the Marxist thinker Ernst Bloch, *Das Prinzip Hoffnung*), but no more messianic pretenders appeared. Orthodox Judaism continued to believe in the traditional doctrine of a personal messiah but *de facto* retreated into a shell of strict halakhic observance. The myth had lost its power to trigger messianic movements.

Hasidism, the great spiritual revival launched in eighteenth-century eastern Europe by the Besht (Yisra'el ben Eli'ezer, 1700–1760), certainly did not relinquish traditional messianic beliefs, but its main emphasis was on closeness to God through spiritual inwardness or (at times) ecstasy. Gershom Scholem has described this process (though the subject is still a matter of scholarly debate) as a “neutralization of the messianic element.” But while Hasidism attempted to provide an answer, in a traditional idiom, for the spiritual seekers as well as for the pauperized masses in the ghettos of eastern Europe, the Jewry of western and central Europe entered the modern age (civil emancipation, assimilation, Reform Judaism).

The implications of these developments for Jewish messianism are still a matter for research. Many of the modern ideologies undoubtedly preserved some of the traditional messianic overtones. At times they made deliberate use of messianic terminology. Of course the progressive liberals and later socialists, and needless to say the national revival known as Zionism, did not think in terms of Armageddon, or a heavenly Jerusalem descending from above, or the “son of David” riding on an ass, but rather of civil liberties, equality

before the law, universal peace, all-around ethical and human progress, the national emancipation of the Jewish people within the family of nations, and so on. But all these aspirations were somehow surrounded with a messianic halo. Jews rarely asked the literalist questions so congenial to Christian fundamentalism. They do not, as a rule, inquire whether a particular historical event is the “fulfillment” of a particular biblical prophecy. But it is impossible, for most of them, to pass through apocalyptic events such as the Holocaust, or to experience the end of exile and the reestablishment of Israel as a sovereign commonwealth, without the stirring of messianic chords in their souls.

In fact, since the Yom Kippur War, a trend toward a “messianization” of politics has become noticeable in Israel, especially among groups advocating settlements on the West Bank or Jewish rights on the Temple Mount. Some of this messianized Zionism goes back to the teaching of Avraham Yitshaq Kook, chief rabbi of Palestine from 1921 to 1935. In the Prayer for the State of Israel the chief rabbinate refers to the state—in an incredibly primitive dispensationalist fashion—as “the beginning of the sprouting of our Redemption.” Others, however, feel that messianism as an eschatological concept should be kept out of the pragmatics and ambiguities of current politics, since it tends to demoralize and mythologize them instead of moralizing them (in the prophetic sense). It is still too early for a definitive historical and sociological evaluation of these conflicting tendencies, and of the nature and role of messianism in contemporary Judaism.

MESSIANISM: MESSIANISM IN THE MUSLIM TRADITION

Islamic messianism has taken two main forms: one is the *masīh*, or “messiah,” which is the title given to the prophet ‘Isā (Jesus) in the Qur’ān; the other is the *mahdī*, or the “divinely guided one.” These two messianic figures are closely associated with *al-masīh al-dajjāl*, or the “false messiah.” In its most basic definition, Islamic messianism consists of the belief that at the end of time, when the world has degenerated into moral corruption and depravity, a *mahdī* will be sent by God to revive Islam, restore faith in God, and bring justice and prosperity to the world. The arrival of the *mahdī* will trigger the emergence of the *dajjāl*, which will in turn be followed by the return of the prophet ‘Isā. The *dajjāl* will then be defeated by the *mahdī*, by ‘Isā, or by both. Finally, these events will bring about the end of the world and the advent of Judgment Day. For Muslims, this doctrine is one of hope in the face of a world that at times may seem to have strayed very far from the path to God. While Islamic messianism refers primarily to the return of the *mahdī*, it is important to begin with the Muslim understanding of the role of ‘Isā al-Masīh (Jesus the Messiah) and his perceived relationship to the false messiah, or *al-masīh al-dajjāl*.

‘ISĀ AL-MASĪH (JESUS THE MESSIAH). In the Qur’ān and *ḥadīth*, the title *masīh* (messiah) is given to ‘Isā (Jesus the son of Mary). In addition to countless *ḥadīth*, there are nine Qur’anic verses referring to Jesus as the messiah (3:45, 4:157, 4:171, 4:172, 5:17, 5:72, 5:75, 9:30, and 9:31). While these verses clearly refer to Jesus as the messiah, the Islamic scripture conceives of a messiah somewhat differently from the Jewish and Christian traditions. In Islam, Jesus is viewed as a Muslim prophet who was miraculously conceived and was

sent to deliver the Islamic message and scripture. This view is part of the broader Muslim belief that Christianity is a divergence from the primordial Islam, which has existed since the creation of the universe.

Muslims believe that Jesus was a prophet in a chain of thousands of Muslim prophets, beginning with Adam and ending with Muḥammad, who were sent by God to preach Islam. According to this view, Jesus is considered to be entirely human and does not share in any way in God’s divinity. In fact, many of the Qur’anic references to Jesus as the messiah specifically reject the Christian conception of the Trinity. For example, Qur’ān 4:171 states:

O people of the Book [i.e., Jews, Christian, Zoroastrians, and some other monotheists]! Commit no excesses in your religion: nor say of God aught but the truth. Christ [*masīh*] Jesus the son of Mary was (no more than) an apostle [i.e., a prophet who brought scripture] of God, and His Word, which he bestowed on Mary, and a Spirit proceeding from Him: so believe in God and His apostles. Say not “Trinity”; desist: It will be better for you: for God is One God: glory be to Him: (Far Exalted is He) above having a son. To Him belong all things in the heavens and on earth. And enough is God as a Disposer of affairs. (Abdullah Yusuf Ali translation)

While Muslims consider Jesus to be one of many prophets, he is still viewed as a somewhat unique prophet. Like Muḥammad, Abraham, Moses, and David, Jesus is one of the few prophets who brought actual scripture, rather than merely being divinely inspired to preach God’s word. Unlike other prophets, Jesus is also believed to be returning at the end of time. However, since Muḥammad is universally accepted as the final prophet, Jesus’ mission is not understood to be a prophetic mission in the strict sense of the term. Rather, Jesus is believed to be returning for a specific purpose, which is to bring justice to the world by reaffirming God’s religion on earth and by destroying the false messiah, either by himself or in cooperation with the *mahdī*, thus paving the way for the end of the world and the coming of the Day of Judgment. In some traditions the concepts of *masīh* and *mahdī* have been conflated, but the majority of Muslims make a clear distinction between the two. Jesus is viewed as a prophet who is returning for a specific purpose. The *mahdī*, on the other hand, is not represented as a prophet at all. Rather, he is viewed as a divinely guided man with a religious mission, but not a prophet. For example, it is not believed that he will bring any new scripture.

This conception of the return of Jesus is based primarily upon *ḥadīth* and popular religious beliefs. For example, in one *ḥadīth* the prophet Muḥammad is reported to have said “[Jesus the] son of Mary will shortly descend among you people (Muslims) as a just ruler” (Bukhārī, 3.34.425). In another *ḥadīth* Muḥammad explains:

The *dajjāl* will appear in my *ummah* [i.e., Muslims] and he will stay (in the world) for forty—I cannot say whether he meant forty days, forty months, or forty

years. And Allāh will then send Jesus son of Mary who will resemble ʿUrwah ibn Masʿūd. He (Jesus) will seek him out and kill him. Then people will live for seven years in which there will be no conflict between any two people. (Muslim, 41.7023)

AL-MASĪH AL-DAJJĀL (THE FALSE MESSIAH). The false messiah, or *al-masīh al-dajjāl*, is portrayed by Muslims as an evil but powerful human being, with a blind right eye that protrudes like a grape. He symbolically represents everything that is evil in human nature, namely greed, atheism, arrogance, malice, tyranny, and deception. For Muslims, his appearance serves as a test of faith in this world, because his power and ability to seduce the hearts of humanity is supposed to separate pious believers from “those who are more concerned with this world than with the next.” It is believed that he will come to oppress humanity and to spread disbelief by trying to convince people to worship him as a god. In one *ḥadīth* the prophet Muḥammad is quoted as saying:

He (the *dajjāl*) will be a young man with twisted, curly hair, and a blind eye. . . he will appear somewhere between Syria and Iraq and will spread mischief right and left. . . We said: “Allāh’s messenger, how long will he stay? He said. . . For forty days, one day like a year, and one day like a month and one day like a week and the rest of the days would be like your days.” He went on to explain how the *dajjāl* will oppress humanity and try to lead people away from faith. Then he said “. . . and it will be at this very time that Allāh will send the messiah, Jesus son of Mary, and he will descend at the white minaret in the eastern side of Damascus wearing two garments lightly dyed with saffron, while placing his hands on the wings of two Angels. . . He will then search for him (*dajjāl*) until he will catch hold of him at the gate of Ludd and will kill him.” (Muslim, 41.7015)

THE MAHDĪ. Although Muslims consider Jesus to be the messiah, the focal point of messianism among Muslims is not Jesus. Rather, it is the *mahdī* (the guided one). The term *mahdī* in this context is also understood to mean that he will guide Muslims. Its grammatical function is therefore simultaneously active and passive. While *mahdī* has always been a common Muslim name, when used in the context of religious doctrine it has a very specific meaning. The doctrine of the *mahdī* is based on *ḥadīth* and popular consensus, rather than the Qurʾān. The following are two samples of such *ḥadīth*: “[Muḥammad] said ‘There will be a caliph in the last (period) of my *ummah* who will freely give handfuls of wealth to the people without counting it’” (Muslim, 41.6961). This *ḥadīth* is understood by many to refer to the *mahdī*. Another *ḥadīth* states, “The Prophet (peace be upon him) said: ‘The *mahdī* will be of my stock, and will have a broad forehead, and a prominent nose. He will fill the earth with equity and justice as it [previously] was filled with oppression and tyranny, and he will rule for seven years’” (Abū Dāʿūd, bk. 36, no. 4272).

Ibn Khaldūn (d. 1406) gives an account of the doctrine during his time:

It has been well known (and generally accepted) by all Muslims in every epoch, that at the end of time a man from the family (of the Prophet) will without fail make his appearance, one who will strengthen Islam and make justice triumph. Muslims will follow him, and he will gain domination over the Muslim realm. He will be called the *mahdī*. Following him, the antichrist [*al-masīh al-dajjāl*] will appear, together with all the subsequent signs of the hour (the Day of Judgment), as established in (the sound tradition of) *ḥadīth*; afterwards, the *mahdī* ʿĪsā (Jesus) will descend and kill the antichrist. Or, Jesus will descend together with the *mahdī*, and help him kill (the antichrist), and have him as the leader in his prayers. Such statements have been found in the traditions [*ḥadīth*] that religious leaders have published. They have been (critically) discussed by those who disapprove of (the matter) and have often been refuted by means of certain (other) traditions. . . a number of leaders have published traditions [*ḥadīth*] concerning the *mahdī*, among them at-Tirmidhī, Abū Dāʿūd, al-Bazzār, Ibn Mājah, al-Ḥakīm, al-Tabarānī, and Abū Yaʿlā al-Mawsilī. (Ibn Khaldūn, *The Muqaddimah*, 1958, pp. 156–157)

The concept of the *mahdī* has evolved over the centuries, but there are several basic characteristics of the doctrine that are common to most definitions. Most Muslims believe that a descendant of the Prophet will return at the end of time, when the world has descended into moral depravity, to revive and restore both his community and the religion of God. It is also believed that he will spread prosperity and goodwill. He is usually described as being a handsome young man with long dark hair, a broad forehead, and a high and prominent nose. He is usually considered to be a descendant of the Prophet. It is often believed that in the process of uniting Muslims and the whole world, he will defeat the *Rūm* (Romans, Greeks, etc.) and will conquer Jerusalem and Constantinople. Some believe that he will make himself first appear in the Levant, while others claim that he will come from Mecca or even Khorasan in northeastern Iran.

The role of the *mahdī* is closely linked to two concepts in Islam: *iṣlāḥ* (to reform Islam through purification) and *tajdīd* (to renew or revive Islam). Both concepts encompass the basic Muslim conception of reform, correction, or purification of the faith. *Iṣlāḥ* is mentioned in the Qurʾān, whereas *tajdīd* is based on interpretations of *ḥadīth*. The core principles in these doctrines is that the Muslim community, which is always in danger of straying from the commandments of God and the examples set by the prophet Muḥammad, must continually be reformed and revived. The primary method for realizing such reforms is to expunge heretical elements from the faith. Reform, therefore, equals purification. For example, if cultural or regional customs enter into the faith (as they usually do), these are often criticized by Muslims as “heretical innovations” (*bidʿah*). Likewise, when people convert from another religion to Islam, they sometimes carry over their previous beliefs and practices. All these are labeled as *bidʿah*, and are condemned. It is not surprising that accu-

sations of *bid'ah* have always been among the more common tactics used by Muslims in sectarian, ideological, and political polemics. Sectarian views that are regarded as heresies are often dealt with in the same way, by labeling their doctrines as *bid'ah*, and calling for the need to purge Islam of these heretical innovations.

In its most general sense, *tajdīd* and *iṣlāḥ* are considered to be the duty of every Muslim. However, in the more specific doctrinal sense, it is believed that this sort of reform should be carried out by a religious leader who is supposed to come at certain intervals (usually once per century) to revive and purify Islam. As one would expect, different groups of Muslims have normally disagreed on exactly who these leaders are, based on sectarian, ideological, and political divisions. For example, al-Ghazālī (d. 1111) and Ibn Taymīyah (d. 1328), whose views were often diametrically opposed to one another, have both been referred to as *mujaddids* (*tajdīd* reformers). The *mahdī* is often treated as a special type of *mujaddid* in that much greater success, power, and influence are attributed to him, and he is divinely guided in a supernatural way. In fact, in some traditions, the *mahdī* is considered to be the last in a chain of *mujaddids*. The fact that he is singled out for mention by the Prophet gives him an added symbolic significance. Most importantly, Muslims believe that he will help to bring about the changes that will set the stage for the end of the world and bring about the Day of Judgment. This gives him a much more specific and important eschatological function compared to other *mujaddids*.

The title *mahdī* has also been used by some Muslims to refer to such early Muslim leaders as Abū Bakr, 'Umar ibn al-Khaṭṭāb, 'Uthmān ibn 'Affān, and 'Alī ibn Abī Ṭālib (these four caliphs, who ruled from 632 to 661, were sometimes collectively referred to as al-Khulafā' al-Rāshidīn al-Mahdīyyīn). The title *mahdī* has also been used to refer to Ḥusayn ibn 'Alī (d. 680), the Umayyad caliph 'Umar II (d. 720), and 'Alī's son by a Ḥanafī woman, Muḥammad ibn al-Ḥanafīyah (d. 700). Several Umayyad, Abbasid, and Fāṭimid caliphs were also referred to as *mahdī*. In fact, the term *mahdī* was used often during the Umayyad and Abbasid periods as a polemical device to legitimize a wide variety of religious leaders.

The most dynamic period of Muslim history with regard to the concept of the *mahdī* is without a doubt the seventh century (especially following the Battle of Karbala in 680) through the twelfth century. The main reason for this is the relative diversity of religious views during this period. The wide variety of heterodox views that proliferated during these centuries, along with the ideological civil wars that were underway, provided an ideal environment in which political and religious leaders were considered to be the *mahdī*. In many cases these early *mahdīs* were Shī'ī leaders of various sorts, like Muḥammad ibn al-Ḥanafīyah, his son Abū Hāshim (d. 717), Mūsā Kādhim (d. 799), and others. However, some of these early *mahdīs* were associated with the Sunnī community, such as Umayyad caliph 'Umar the II;

the founder of the 'Abbāsīd dynasty, al-Saffāḥ (d. 754); and other Abbasid caliphs. (For a detailed discussion of these early uses of the term *mahdī*, see Madelung, 1986.)

One of the most significant divisions among Muslims on the doctrine of the *mahdī* is between Shī'ah and Sunnīs. The primary difference between the Sunnī definition of the *mahdī* and the Shī'ī view is his identity, and by extension his sectarian affiliation. Generally, the Twelver Shī'ah consider the *mahdī* to be a vanished *imām* who will return at some future time. While Sunnīs and Shī'ah generally accept that the *mahdī* will reward the faithful and punish the wicked, for most Shī'ah the *mahdī* will also vindicate the Shī'ī cause by showing Sunnīs and other non-Shī'ah the errors of their ways, thus reaffirming Shiism and the doctrine of the *imāmat*.

A typical *ḥadīth*, attributed to the first *imām*, 'Alī ibn Abī Ṭālib, sums up the Shī'ī doctrine:

Soon God shall bring forth a group whom He Loves and they too are His lovers and the one who is like a stranger amongst them shall take over the Government. Verily, he shall be the 'MAHDĪ'; his face rosy and hair golden in color. He will fill the earth with justice without any difficulty. In his very childhood, he shall get separated from his mother and father and from the viewpoint of training he shall be rare and matchless. He shall rule over the Muslim countries with utmost calm and security and time shall be favorable and friendly toward him. His words will be accepted; the young and the old shall humbly obey him. He shall fill the earth with Justice just as it had previously been filled with oppression. Then, at that moment his *imāmat* shall reach its perfection and Viceregency will be established for him. Moreover, Allāh will make the dead to rise from their graves and return them back to this world. Then, like people who get up from their sleep, they shall see nothing but their own houses. The land will flourish and by blessing of his [i.e., *mahdī*'] existence, it shall become fresh and fruitful. Seditions and disturbances shall vanish and blessings and welfare will increase manifold. (Ṣadr Iṣfahānī, 1994, pp. 39–40)

While Shī'ah and Sunnīs have historically disagreed on the identity of the *mahdī*, they have agreed on many of the basic details surrounding his return. For example, they generally accept that the *mahdī* will be a descendant of the Prophet who returns at the end of time, when corruption and tyranny are widespread, in order to spread justice and renew Islam. Shī'ah have relied on both Shī'ī and Sunnī *ḥadīth* to articulate their definition of the *mahdī*. For example, the prominent Shī'ī scholar Ṣadrudīn Ṣadr Iṣfahānī, in his book *Al-Mahdī* (1994), quotes Sunnī *ḥadīth* from Abū Dā'ūd, Tirmidhī, Aḥmad ibn Ḥanbal, and Ibn Majah in which the Prophet is quoted as saying: "If there remains not more than a day from the life of the earth, indeed God shall make a person from my progeny to appear" (p. 33). He also quotes another *ḥadīth* of Aḥmad ibn Ḥanbal: "*Qiyāmat* shall not be established until the earth is filled with cruelty and oppres-

sion. Then a person from my progeny shall appear and fill it with equity and Justice” (p. 33).

However, since Shī‘ī groups have different definitions of the imamate, they also differ on the identity of the *mahdī*. For example, the most widespread Shī‘ī group, called the Ithnā ‘asharīs (Twelvers) or Imāmīs, believe that the *mahdī* will be the twelfth *imām* Muḥammad al-Mahdī, who was believed to have gone into occultation in 874. For other Shī‘ah, the *mahdī* is (or was) believed to be a different *imām*, such as ‘Alī ibn Abī Ṭālib, Ḥusayn ibn ‘Alī, Ḥasan al-‘Askarī, Ja‘far al-Ṣādiq, Ismā‘īl ibn Ja‘far, Mūsā al-Kāzim, Muḥammad ibn al-Ḥanafīyah, the *imāms* of the Fāṭimid dynasty, or other *imāms*.

The earliest historical record we have of a clearly Shī‘ī conception of the *mahdī* was shortly after the massacre at Karbala of the Prophet’s grandson Ḥusayn along with his family in 680. This traumatic event inspired many Muslims to call for an uprising of someone from the Prophet’s progeny to take vengeance on the Umayyad regime. It was within this context that in 685 to 687 Mukhtār led an uprising in the name of Ḥusayn’s half brother, Muḥammad ibn al-Ḥanafīyah. He said: “Al-Mahdī Muḥammad ibn ‘Alī [i.e., ibn al-Ḥanafīyah], the son of the *Wāṣī*, sent me to you as his trusted man, minister, and chosen supporter, and as his commander. He ordered me to fight against the blasphemers and claim vengeance for the blood of the people of his House, the excellent ones” (Jafrī, 1979, p. 262). Eventually, Mukhtār and his followers were killed, but once Muḥammad ibn al-Ḥanafīyah died he was considered by many to have gone into occultation. Following this precedent, several Shī‘ī claimants emerged, and others were given the title with or without their own acknowledgement.

Another variation on the *mahdī* doctrine is the Ṣūfī view, which stresses the mystical lineage of the *mahdī* and his role as Ṣūfī master. Overall, the Ṣūfī view does not fundamentally differ from the views articulated by other Muslims, except in one very important respect. Whereas the Sunnīs expect the return of a pious Muslim reformer, and Shī‘ah expect the return of a vanished *imām*, the Ṣūfīs generally expect the *mahdī* to be the final link in a long chain of masters and disciples in the Ṣūfī tradition. In that sense, this continuous chain or lineage begins with Muḥammad and ends with the *mahdī*. The *mahdī* is therefore viewed as the final and most perfect Ṣūfī master, who is able to guide Muslims to God. As the “divinely guided guide of humanity” he will occupy a place between the believers and God. This is not to say that the *mahdī* will be divine in any way. Rather, it is to say that he will serve as the axis of human faith in God, or stated differently, he will serve as a doorway of sorts on the path to God.

It is not surprising that throughout Muslim history there have been numerous political and religious leaders who either claimed to be the *mahdī*, or were considered by others to be the *mahdī*. These mahdist movements usually have involved a combination of charismatic leadership, religious re-

formism, and revivalism, and some sort of military struggle, either against non-Muslims or against Muslim leaders who were deemed to be morally corrupt. One interesting historical trend is that for Shī‘ah the *mahdī* rebellions tended to be restricted to the early centuries of their movements, at a time when Shī‘ī doctrines were more heterodox than orthodox. There are some later exceptions to this general rule, such as Ismā‘īl Safavī’s (d. 1524) mahdist claims in the fifteenth century. Ismā‘īl was accepted as a messianic figure by his tribal followers, the Qizilbāsh, who have been accused by some of going so far as to deify him. While Ismā‘īl and his followers were technically Shī‘ī, his movement was based more on a particular strain of rural Ṣūfī beliefs that tended toward Shiism. His military successes helped to bolster his religious legitimacy. However, after the Safavid Empire was established in 1501, the state shifted toward orthodox Shī‘ī doctrine, according to which he could not be considered a messianic figure.

While for Sunnīs, mahdist movements have not been particularly widespread, they have occurred throughout Islamic history. In fact, mahdist movements continued to emerge as late as the early modern period, after which there was a noticeable reduction in the frequency of their occurrence. Often these movements had roots in Sufism. The most famous mahdist movement in recent history occurred in the Sudan in the 1880s. A local Ṣūfī leader named Muḥammad Aḥmad declared himself the *mahdī* in 1881. His movement was centered on a rejection of the religious legitimacy of the Egyptian Ottoman rulers, whom he accused of straying from Islam by tolerating (or even promoting) gambling, prostitution, music, dancing, and the drinking of alcohol. His followers were called the Anṣār, and they believed that his military successes were due to divine intervention. The state he established in Khartoum lasted until 1899. This movement was in many ways typical of Sunnī mahdist movements in that it was built around a charismatic leader who took up a local political cause by pursuing armed struggle against the state. It was also similar to many mahdist movements in that it was at the political periphery of the empire and was associated with rural Sufism and heterodox Islam.

In recent decades, the use of the *mahdī* doctrine in political discourse has been less common. One of the reasons for this has been the relative displacement of traditional popular religious ideals by modernist religious orthodox sentiments. Muslim political movements have tended toward orthodox legalism, which is usually hostile to Sufism, Shiism, and popular Islam. A similar trend in orthodox Shiism can be seen, because anyone who claims to be the *mahdī* would necessarily have to be the vanished *imām* as well.

MESSIANISM: SOUTH AMERICAN MESSIANISM

Messianism is not a universal religious phenomenon. It appears in some, but not all, societies of the world, and in some religious systems but not in others. South America is one of those regions prone to the development of messianism, regardless of the nature of a society. This entry shall explore how expressions of messianism may be found among the peasant inheritors of the high civilizations that developed in the Andes, as well as among hunters and gatherers of the Amazonian region. Although most evidence derives from the postconquest period, it is possible to identify certain structural concomitants and cultural motives associated with South American messianism that are different from Christian and European forms of this religious phenomenon. Hence the kind of messianism that this entry will discuss is a non-Western variety, although in some cases it may disguise itself in Christian trappings.

In contrast to Christian messianism, South American messianism is generally accompanied by a cyclical or static conception of time, which is believed to be encapsulated in fixed ages that are represented under a symbolic number, generally five or three. For Mesoamericans, these ages were also conceived as having ended as a result of a cosmic cataclysm that closed a period lasting either one thousand or five

hundred years. In the Andes, the Quechua name for this catastrophic event was *pachacuti*, which literally means "transformation of the earth." The name for the thousand-year period was *capac huatan*, or "great year." Since the beginning of time, four *capac huatan* were thought to have taken place, along with nine *pachacuti*, given that during every *capac huatan*, an internal *pachacuti* divided it into two periods of five hundred years. Linked to this schema was the idea that the Incas, when they were conquered by the Spanish, were seen as emerging after an elapse of 4,500 years, after which they would eventually disappear at the close of the 5,000-year period.

In Mexico the means devised to avoid the interruption of the circulation of the sun, which produced the end of the ages, was the sacrifice of human beings. Among the Incas, however, the king was believed to have a divine nature, raising him to the level of the gods. Divine kingship was common to both cultural areas, but as Henri Frankfort noticed when comparing the Egyptian pharaohs with the kings of Mesopotamia and Israel, the position of the Inca king was next to the celestial gods, whereas the kings of Mesoamerica were considered to be closer to mortal beings. As such, the Inca king could command and punish the divinities, and he could even stop time. Consequently, some of the human sacrifices that took place in the Andes were intended to maintain the health of the Inca king, given that what really endangered the cosmic order was his death.

A paradigm of the capacity to maintain and restore order embodied in each Inca king can be found in one of the Incas who are generally listed as members of a dynastical order. His name is Pachacuti, and he occupies the ninth position within the dynastical list that is commonly found in old chronicles. Pachacuti holds the same name as the cataclysm described above because as the restorer of order and the initiator of a new age he is also part of the interregnum that marks the transition from chaos to order. Interestingly, Pachacuti's ninth position corresponds to the most ordered time cycle within the sequence of five ages—the last Inca dynasty that started in the 4,500th year.

It is under this conceptual framework that postcolonial Andean messianism tended to develop. It is manifested more clearly in a chronicle written during the sixteenth and early seventeenth centuries by a Peruvian Indian named Felipe Guamán Poma de Ayala (1526–1614). The title of this manuscript is *El primer nueva corónica y buen gobierno* (First new chronicle and good government), but given its messianic overtones, it could more properly be titled "Letter to the King." A careful reading reveals that for the author the Spanish conquest was not properly a historical event but a *pachacuti* that had been triggered by the intermingling of Spaniards and Indians, who represented two separate principles within a dualistic conception of order that conceived the principles as separate and in equilibrium. As a consequence of this cosmic event, the world was turned upside down. The social order had been altered by the introduction of circum-

stances that enabled the possibility of change, and the Indians lost their property and suffered innumerable injustices.

The best evidence that the conquest was seen as a *pachacuti*-type cataclysm is that throughout his chronicle Guamán Poma speaks about the existence of five ages, with the Incas being located in the fifth age. However, when he is forced to incorporate the conquest and its aftermath, he expands his schema of ages to include a tenth age, naming the sixth *Pachacuti*. But even more important is the fact that Guamán Poma estimates the duration of the world since its beginnings to be 6,613 years, a figure he obtains by adding the year in which he was writing his chronicle (1613) to a mythical 5,000-year period corresponding to the closing period of the five ages.

Having conceived in these terms the sorrowful sentiments awakened by colonial domination, the only solution sought by this Indian writer is that somebody proportional to the cosmic nature of the crisis might overcome it. For him this person was the king of Spain, but the king of Spain conceived as an Inca king—that is, as a kind of metaphysical being capable of confronting a problem whose solution was beyond the power of common mortals. Guamán Poma thus addresses his chronicle to the king of Spain, not as a humble Indian but as the descendant of the “Second Person” of the Inca (who, as king of Chinchaysuyo, was a leader next in hierarchy below the Inca king and the one who held the highest position among the kings of the four quarters) and as the unified voice of the Indians of the four quarters. This perhaps explains why he chose to call himself *Guaman* (a bird associated with the upper realm) and *Poma* (a feline linked to a lower moiety), since this image conveys a sense of unity through complementary opposites.

After Guamán Poma, the figure of the Inca king became central to the numerous messianic expressions that developed in the Andes, even up to the present day. However the first messianic movement recorded for this area does not clearly show that this heroic figure would have been present. Instead, those who figure prominently are a type of Andean divinity known as *guacas*.

The first messianic movement known to have emerged in the Andean region was the *Taqui Ongoy*, a Quechua term that literally means “dance illness.” One of the characteristics of this movement was that followers entered a state of trance provoked by dancing and oscillating their heads under the rhythm of a repetitive chant and the consumption of large amounts of coca leaf and brewed maize. This movement dates from around 1564; a priest named Cristóbal de Albornoz had an important role in its discovery and in its extirpation. Through him and other priests we learn that the preachers of this movement explained to their followers that the Spaniards dominated the Indians because their God had defeated the *guacas*. However, a change was taking place, and the *guacas* were becoming stronger and were in the process of defeating the Christian God. Under the framework of a dual conception of the world, the followers of the movement

grouped around two important religious centers—one associated with an upper moiety, and the other with a lower one. The first site had as its central divinity the god Pachácamac and was located towards the north in Chinchaysuyo; the second had the god Titicaca and was located in Collasuyo, towards the south. To attain final triumph, which would consist of a reversal of time analogous to a *pachacuti*, the preachers directed the Indians to avoid Christian practices and resume those from before the Hispanic period.

Perhaps because the Inca rulers were still actively resisting the Spanish in Vilcabamba, this messianic movement does not recall the presence of an Inca image (as in later movements), and instead addresses the *guacas*. However, the movement shares with Guamán Poma’s messianism the expectation of a cosmic reversal of the world associated with a cyclical view of time and an image of a unified Indian world, an image represented by the two most important religious centers located in opposite but complementary moieties.

Evidence of the centrality of the Inca in Andean messianism can be found in the movements headed by Juan Santos Atahualpa (forest of central Peru) and José Gabriel Condorcanqui (Cuzco) during the eighteenth century. Two representative movements of the nineteenth century are those of Atusparia (Ancash) and Rumi Maqui (Puno). The twentieth century witnessed the vast expansion of the Inkarrí myth and the embodiment of this myth in such messianic leaders as Ezequiel Ataucusi Gamonal, the founder of the Israelites of the New Universal Covenant. The Inkarrí myth has many versions, but those with more messianic connotations describe a hero named Inkarrí (a combination of *inka* and *rey*, or king), who is the offspring of the Sun and a herder woman. After being beheaded by the Spaniards, Inkarrí was said to be in the process of magically reconstituting himself. Once this process was complete, order would be reintroduced to the Andean world.

This myth was prominent primarily in the highlands, although stories of a hero known as “Inca” (or “Inka”) spread among the inhabitants of the Amazonian lowlands. This figure also carried messianic overtones, but they were unlike those associated with the highland hero. Rather, this figure resembled other Amazonian heroes who suggest the Cargo cults of Melanesia. For the Ashaninka of the Peruvian central Amazon, Inka was the ruler of their territory and a great shaman “who voyaged downriver on a raft at a time when a great flood was produced by the Caucasians. This enabled the Caucasians, whose territory is downriver, to capture Inka and force him to manufacture the superior artifacts which they now possess. Inka remains a captive downriver to this day, wishing to return to his people but restrained by the Caucasians. If he ever did return, the existing relationship between the Campa and Caucasians would of course be reversed” (Weiss, 1969, p. 109).

In other Ashaninka versions of this myth, the owner of these attributes is Pachakamaite, the son of the Sun and his

wife, Mamantziki. Pachakamaite has the power to manufacture guns, ammunition, pots, salt, and other objects important to the wider society. Stéfano Varese's informants told him that in the past their ancestors, who were poor, could obtain these objects by acceding to this divinity after a long journey during which they met a number of dangerous beings. But this is no longer possible because white people have appropriated these goods to sell them to the Ashaninka. They have thus interrupted the route to Pachakamaite's realm by raising fences to keep natives from obtaining what Pachakamaite has promised them (Varese, 1973, p. 360).

Mythical heroes with similar characteristics are also found among other Peruvian Amazonian groups, including the Amuesha and Machiguenga, and among natives of other South American countries. Among some Ge Indians of central Brazil, for example, heroes of this nature are reported with names associated with their particular dialects. Some of these heroes became the focus of messianic movements. This is the case with the Ramkókamekra-Canelas Indians of Maranhão, who in 1963 developed a messianic movement headed by a woman prophet called Kee-khwei. According to William Crocker, Kee-khwei predicted that civilized people would be thrown into the forest to live as hunters, and the Indians would go to the cities, where they would direct road construction and pilot planes. Kee-khwei obtained this prediction from a revelation granted to her by a mythical hero known as Aukhé, who spoke to her through a daughter she carried in her womb. The unborn daughter was thought to be the hero's sister, and it was explained that she was coming to this world because her brother was tired of the ill treatment that white people imposed on Indians. Certain rituals consisting mostly of dancing were conducted to ensure the materialization of this prediction, which was to occur at the moment the child was born. The more intense the dance and the greater the offerings, the more plentiful the wealth that would be received in the new life. Not performing the rituals or contributing money to the movement would result in severe punishments from a group of youngsters who served Kee-khwei. In addition, followers were free to seize the cattle of any person because the cattle was said to belong to Aukhé. Followers did not fear repression because it was stated that the mythical hero would divert bullets and that a great fire would annihilate aggressors (Crocker, 1976, p. 516).

Almost twelve years before this movement, around 1951, a similar messianic movement had developed among the Krahó, an eastern Timbira group. Here again the expectations focused on appropriating material objects belonging to white people through the mediation of a divine hero. Although the characterization of this divinity as a bearded man with curly hair and holding a gun do not correspond to the mythical pantheon of this group, the linkage of this hero with rain makes him similar to Aukhé (Sullivan, 1988, p. 584). According to Julio César Melatti, the movement unfolded around a prophet named Rópkur Txortxó Kraté, also known as José Nogueira, who incorporated the powers of the

divinity to punish Christians and to transform the Indians into civilized people. Because the divinity was associated with rain, thunder was the main weapon with which he was to inflict his punishments, which were considered revenge for Indians who had been killed and a means for the Indians to avoid being dispossessed from their lands. Among the methods suggested for becoming civilized was the building of a big house to store the merchandise that would arrive in a riverboat and the performance of both traditional and Western dances on certain days of the week. In addition, the consumption of specified foods, particularly meat, during certain days was prohibited in order to accelerate the Indians' transformation into civilized people.

As reported by Roberto Da Matta (1967, 1970), Julio César Melatti (1972), and Lawrence Sullivan (1988), all of these movements were inspired by the image of Aukhé, a hero who became widely known among several Ge groups. This personage was always associated with water and with the wealth of the whites, which the Indians believed was rightfully destined to belong to them. The resemblance of this hero with the Amazonian Inka and Pachakamaite is well known. All these cases, however, can be contrasted with the messianism that developed in the Andes. Whereas that of the Amazon suggests an inclination to accede to Western civilization, the messianism of the Andes suggests a wish to express a rejection. In both cases, white people are evil, but in the Amazon it is because they have developed obstacles to the Indians' access to wealth, whereas in the Andes it is because white people have altered the Indians' normal conditions of existence.

Another South American messianic expression that has attracted the attention of scholars is the search for the land without evil by several native groups, in particular the Tupi-Guaraníes. Curt Nimuendajú (1978) and Alfred Métraux (1973) suggest that this search began before the arrival of Europeans. Once more this expression incorporates an idea of temporal cycles that end in cataclysms, the presence of a divine figure, various beliefs about the afterlife, and the presence of shamans as leaders. The most overt manifestation of this kind of messianism is the mobilization of vast contingents of Indians throughout Brazilian, Peruvian, and Paraguayan territory. These were led by shamans who preached the imminent destruction of the world, with the only possible salvation being to settle in a land without evil. In traditional mythology this place was the settlement of Nanderuvusú, the creator, and of his wife, Ñandesy. It was described as a realm where plants grew without being cultivated and fruits ripened at the spot. It was commonly said to be located at the center of the earth, which was identified as existing in the east. Only the souls of the children could arrive there after overcoming dangers. It was also said that if the creator had the power to create the world, he could destroy it. By ordering his son Ñanderikey to remove the east-west-oriented pole located at the center world, Nanderuvusú could cause the world to collapse. However, there was a mag-

ical solution for escaping this threat. The solution involved dancing and migrating in an easterly direction.

Among the Quechua Indians of southern Peru, an equivalent to this land without evil is Paititi. A settlement with this name, located towards the east in the southern forest, was known as early as the sixteenth century. Even the eighteenth-century rebel Tupac Amará II mentioned Paititi as part of his dominion as an Inca. Today, Paititi is described as a kind of urban paradise, with golden buildings where Incas from the past continue living. According to some versions, only Indians who speak an uncontaminated Quechua language are permitted to enter Paititi. Ezequiel Ataucusi Gamonal, the prophet of the Israelites of the New Covenant, is sometimes included as one of its visitors.

Such is the permanence and expansion of this belief that not only did the Israelites of the New Covenant succumb to it, but other syncretic movements did as well, including that developed in the Peruvian Amazon by José Francisco de la Cruz, who began his movement in the 1960s in Brazil, Paraguay, Uruguay, Argentina, Peru, and Colombia. In Peru the name of the church he founded is Cruzada Católica Apostólica Evangélica del Perú (Catholic, Apostolic, Evangelical Crusade of Peru). In Peru this church has about four thousand followers. In Brazil, where there are approximately twenty thousand followers, the main center of the church is located in the village of Vila Santa next to the Putumayo river, an area regarded as a land without evil (Regan, 1993, p. 341). Like many syncretic messianic movements, this one departs from the idea of salvation in the face of an imminent end of the world. To overcome this threat, the symbol of the cross and the search for the land without evil is assigned an important role, which has had great appeal among natives of the Tupi Guarani family and acculturated Cocamas, Cocamillas, and Omahuas, who believe that those who search for the land without evil will have larger harvests (Regan, 1993, p. 360).

Another syncretic movement—this time of Andean origin—that has incorporated belief in a land without evil is the Israelites of the New Universal Covenant. Followers of this movement hold that salvation in the face of the imminent end of the world will be possible only by becoming a member of this religious organization, whose leader, Ezequiel Ataucusi Gamonal, is seen as the new Christ and the incarnation of the Holy Ghost, as well as a new Inca. They call themselves “Israelites” because they have incorporated into their movement the ancient ritual practices of the Israelites of the Old Testament including wearing the kinds of garments the Hebrews used in the past during their celebrations. To this form of nativism they also proclaim a restoration of Inca practices, and it is according to these practices that they model the colonies they have developed in the Amazonian region. Moreover, this Inca “utopia” became the headquarters of the political party the group established to support the candidacy of Ezequiel Ataucusi Gamonal to the presidency of the Republic of Peru.

The colonies, therefore, represent the materialization of the Inca utopia, and as such they become the land without evil, where all the Israelites should go to wait for the end of the world; it is from here that they will be transported to Canaan, once more located in the east, to attain complete salvation. The Israelites of the New Covenant represent a synthesis of almost all the varieties of messianism that developed in South America, although this group added a biblical dimension that is a variation of Adventism.

JUAN M. OSSIO (2005)

METALS AND METALLURGY. Archaic, nonliterate peoples, as well as prehistoric populations, worked meteoric iron long before they learned to use the ferrous ores occurring on the earth's surface. They treated certain ores like stones, that is, they regarded them as raw material for the manufacture of lithic tools. A similar technique was applied until recently by certain peoples having no knowledge of metallurgy: they worked meteorites with silex (flint) hammers and fashioned objects whose shapes resembled their stone models in all respects. This was how the Greenland

Inuit (Eskimo) made their knives out of meteoric iron (Andrée, 1984, pp. 121ff.). When Cortés asked the Aztec chieftains where they had gotten their knives, they pointed to the sky. Like the Maya of Yucatan and the Inca of Peru, the Aztec used only meteoric iron, which they valued more highly than gold. In fact, excavations have revealed no trace of terrestrial iron in the prehistoric deposits of the New World (Forbes, 1950, pp. 401ff.).

Paleo-Oriental peoples presumably held similar ideas. The Sumerian word *an-bar*, the earliest vocable designating iron, is written with the signs for “sky” and “fire.” Campbell Thompson renders it “celestial lightning (or meteorite),” but it is usually translated “celestial metal” or “star-metal” (Eliade, 1978, p. 22; Bjorkman, 1973, pp. 114ff.). For a long period the Egyptians too knew only meteoric iron, and the same is true of the Hittites: a text of the fourteenth century BCE states that the Hittite kings used “the black iron of the sky” (Rickard, 1932, vol. 1, p. 149). Iron, therefore, was scarce, and its use was principally ritual.

THE DISCOVERY OF SMELTING. It required the discovery of the smelting of ores to inaugurate a new stage in the history of mankind. Unlike the production of copper or bronze, the metallurgy of iron very soon became industrial. Once the secret of smelting magnetite and hematite was discovered, there was no longer any difficulty in obtaining large quantities of iron, for deposits were very rich and easy to exploit. But the handling of telluric ores differed from that of meteoric iron, as it did also from the smelting of copper and bronze. It was not until after the discovery of furnaces, and particularly after perfecting the technique for “hardening” metal brought to the point of white heat, that iron achieved its preeminent position. It was the metallurgy of terrestrial iron that made this metal fit for everyday use. The beginnings of iron metallurgy on an industrial scale can be fixed at a period between 1200 and 1000 BCE, in the mountains of Armenia. From there the secret of smelting spread across the Near East, the Mediterranean, and central Europe, although, as I have noted, iron, whether of meteoric origin or from superficial deposits, was known in the third millennium in Mesopotamia, in Asia Minor, and probably also in Egypt (Forbes, 1950, p. 417; Eliade, 1978, pp. 23ff., 201ff.).

MINES: THE WOMB OF MOTHER EARTH. The discovery of furnaces had important religious consequences. Besides the celestial sacredness of the sky, immanent in meteorites, there was now the telluric sacredness of the earth, in which mines and ore share. Metals “grow” in the bosom of the earth. Caves and mines are assimilated to the womb of Mother Earth. The ores extracted from mines are in some sense “embryos.” They grow slowly, as if obeying a temporal rhythm different from that of vegetable and animal organisms; nevertheless, they do grow, they “ripen” in the telluric darkness. Hence, their extraction from Mother Earth is an operation performed prematurely. If they had been given the time to develop (that is, if they were to come to term in geological time), ores would become ripe, “perfect” metals. Belief in the

natural growth, and thus in the metamorphosis, of metals is of very ancient origin in China and is also found in Vietnamese Annam, in India, and in the Malay archipelago. The peasants of Vietnamese Tonkin, for example, have a saying: “Black bronze is the mother of gold.” They believe that gold is engendered naturally by bronze, but only if the bronze has lain a sufficiently long period in the bosom of the earth. “Thus the Annamites are convinced that the gold found in the mines is formed slowly *in situ* over the centuries and that if one had probed the earth originally, one would have discovered bronze in the places where gold is found today” (Przylyski, 1914, p. 3). Similar beliefs survived even into eighteenth-century Europe (Eliade, 1978, pp. 46ff.).

The Egyptians, who, according to Plutarch and Diodorus, hated iron—which they called “the bones of Seth”—considered that the flesh of gods was made of gold; in other words, that the gods were immortal. That is why, after the model of the gods, Pharaoh was also assigned flesh of gold. Indeed, as repeatedly proclaimed in the Hindu Brahmanas, “Gold is immortality.” Consequently, in many cultures, to obtain the elixir that transmutes metals into alchemical gold is tantamount to obtaining immortality.

In Eastern as in Western alchemy, the transmutation of metals into gold is equated with a miraculously rapid maturation. The elixir (or the philosopher’s stone) completes and consummates the work of nature. One of the characters in Ben Jonson’s play *The Alchemist* (1610) asserts that “lead and other metals . . . would be gold if they had time,” and another character adds, “And that our Art doth further.” That is to say, the alchemist prolongs the dream and the ideology of miners and metalworkers: to perfect nature by accelerating the temporal rhythm, with the difference that the *aurum alchemicum*—the elixir—confers health, perennial youth, and even immortality. As is well known, by the end of the eighteenth century alchemy was supplanted by the new science of chemistry. But the alchemist’s ideals survived, camouflaged and radically secularized, in nineteenth-century ideology.

In many parts of the world miners practice rites involving a state of purity, fasting, meditation, prayers, and cultic acts. The rites are governed by the nature of the intended operation, for the performance of them is meant to introduce the worker into a sacred zone, supposedly inviolable: he enters into contact with a sacrality that does not participate in the familiar religious universe, for it is a deeper and also a more dangerous sacrality. The miner feels that he risks entering a domain that does not rightfully belong to man: the underground world with its mysteries concerning the slow mineralogical gestation taking place in the womb of Mother Earth. All the mythologies of mines and mountains, their countless fairies, genii, elves, phantoms, and spirits, are the multiple epiphanies of the sacred presence that the individual confronts when he penetrates the geological levels of life (Eliade, 1978, pp. 53ff.).

Thus, the Melanesians opened a new mine only after long rituals and ceremonials. The Malay *pawang* (medicine man) derived a very fair revenue from propitiating and scaring those spirits who had to do with mines and mining (W. W. Skeat, quoted in Eliade, 1938, p. 92). Among many African peoples, the chief, surrounded by a shaman and the workers, recites a special prayer to his ancestral spirits, who preside over the mine, and only then does he determine where the digging shall be done (Cline, 1937, p. 119). In Europe, until the end of the Middle Ages, miners opened a mine only after the celebration of a religious ceremony (Sébillot, 1894, p. 421).

FURNACES AND THE "GROWTH" OF THE ORE. Laden with this dark sacrality, the ores are taken from the mine to the furnaces. Then begins the most difficult and riskiest operation. The artisan takes the place of Mother Earth in order to hasten and perfect the "growth" of the ores. The furnaces are in some sense a new, artificial womb in which the ore completes its gestation. Hence the countless precautions, taboos, and rituals that accompany smelting.

In Africa, camps are set up in the vicinity of the mines, and there the workers live, in a state of purity, throughout the mining season, which sometimes lasts for several months (Cline, 1937, p. 119). The Kitara believe that if the bellows-maker has had sexual relations during the course of his work, the bellows will constantly fill up with water and refuse to function (*ibid.*, p. 121). The belief that the sexual act can in some way compromise the success of the work is general throughout sub-Saharan Africa. This prohibition is even stated in the ritual songs sung during the work. Indeed, smelting represents a sacred marriage—the mixture of "male" and "female" ores—and consequently all the sexual energies of the workmen must be kept in reserve, to ensure the magical success of the union that is taking place in the furnaces. The nuptial symbolism is present in many metallurgical ceremonies. The Kitara smith treats the anvil like a bride. When men bring it into the house they sing as though for a nuptial procession. In accepting it, the smith sprinkles it with water so that it "may bear many children" and tells his wife that he has brought a second wife home to help her (*ibid.*, p. 118).

THE MAGICO-RELIGIOUS POWERS OF THE SMITH. The metallurgist, like the blacksmith and before him the potter, is a "master of fire." It is by means of fire that he brings about the passage of a material from one state to another. Smelting proves to be not only the means of "acting faster" but also of acting to make a different thing from what already existed in nature. This is why, in archaic societies, smelters and smiths are held to be masters of fire, along with shamans, medicine men, and magicians. But the ambivalent character of metal—laden with powers at once sacred and demonic—is transferred to metallurgists and smiths: they are highly esteemed but are also feared, segregated, or even scorned. Thus, in West Africa, smiths play important roles in secret societies, enjoy the prestige normally accorded magicians,

and form separate clans. In the Kongo and surrounding regions, they have a close association with priests and chiefs (and sometimes are one and the same); elsewhere (e.g., among the Chagga, Hamitic Bantu-speaking agricultural workers) the smith is both feared and respected. By contrast, in pastoral Hamitic cultures and among steppe hunters, smiths are despised and form a caste set apart (Eliade, 1978, pp. 90ff.; see also Dieterlen, 1965, pp. 10ff.). In Indonesia and elsewhere in South Asia, the smith and the smelter are much respected for their secret powers (O'Connor, 1975, pp. 177ff.).

The tools of the African smith share this sacred quality. The hammer, the bellows, and the anvil are considered animate and miraculous; they are regarded as capable of operating by their own magico-religious force, unassisted by the smith. The art of creating tools is essentially superhuman—either divine or demonic (for the smith also forges murderous weapons). Remnants of ancient mythologies belonging to the Stone Age have probably been added to, or woven into, the mythology of metals. The stone tool and the hand ax were charged with a mysterious power; they struck, inflicted injury, caused explosions, and produced sparks, as did the thunderbolt. The ambivalent magic of stone weapons, both lethal and beneficial, like the thunderbolt itself, was transmitted and magnified in the new instruments forged of metal. The hammer, successor to the ax of the Stone Age, becomes the emblem of the powerful storm gods. Indeed, storm gods and the gods of agricultural fecundity are sometimes conceived as smith-gods (for examples, see Eliade, 1978, pp. 92ff.; Dieterlen, 1965, *passim*).

In many mythologies divine smiths forge the weapons of the gods, thus insuring them victory over dragons or other monstrous beings. In the Canaanite myth, Koshar-wa-Hasis (literally, "adroit-and-clever") forges for Baal two clubs with which he will kill Yamm, lord of the seas and underground waters. In the Egyptian version of the myth, Ptah (the potter god) forges the weapons that enable Horus to conquer Seth. Similarly, in the Vedas, the divine smith *Tvaṣṭṛ* makes Indra's weapons for his battle with *Vṛtra*; Hephaistos forges the thunderbolt that will enable Zeus to triumph over Typhon. But the cooperation between the divine smith and the gods is not confined to his help in the final combat for sovereignty of the world.

The smith is also the architect and artisan of the gods, supervises the construction of Baal's palace, and equips the sanctuaries of the other divinities. In addition, this god-smith has connections with music and song, just as in a number of societies the smiths and braziers are also musicians, poets, healers, and magicians. Thus, the mythic African smith is a culture hero. He has been enjoined by God to complete creation, to organize the world, to educate men, that is, to reveal to them the arts and the religious mysteries. For this reason, in many African cultures, smiths play the central role in puberty initiations and in male secret societies. Similarly, in early Greece, certain groups of mythical person-

ages—Telchines, Cabiri, Curetes, Dactyls—were both secret guild associations performing initiations of young boys and corporations of metalworkers (Eliade, 1978, pp. 101ff.). Blacksmiths were equally important in the initiatory rituals of the ancient Germans and in the Japanese male societies. In old Scandinavia there was a close connection between the profession of the smith and the art of the poet and musician. The same associations are to be found among the Turco-Tatars and Mongols, where the smith is linked with horses, singers, and poets. Tzigane nomads are, even today, a combination of smith, tinker, musician, healer, and fortune-teller (ibid., pp. 98ff.). It seems, then, that on many different levels of culture (an indication of great antiquity) there is an intimate connection between the art of the smith, occult techniques (shamanism, magic, healing, etc.), and the arts of song, of the dance, and of poetry.

All these ideas and beliefs articulated around the trades of miners, metallurgists, and smiths have markedly enriched the mythology of *homo faber* inherited from the Stone Age. But the wish to collaborate in the perfecting of matter also had other important consequences. In assuming the responsibility for changing nature, man took the place of time; what would have required eons to ripen in the subterranean depths, as the artisan believed, he could obtain in a few weeks, for the furnace replaced the telluric womb. Millennia later, the alchemist did not think differently.

METAMORPHOSIS **SEE** SHAPE SHIFTING; TRANSMIGRATION

METAPHYSICS is generally understood as a philosophical inquiry into the fundamental nature of reality. The word *metaphysics* derives from the Greek *meta ta phusica* ("after the things of nature"), a classificatory rubric used by commentators on and editors of Aristotle's corpus to refer to an untitled group of texts concerned with "first philosophy." Western medieval and modern philosophers often have construed metaphysics as the most basic and most comprehensive of philosophical inquiries, one that is primarily focused on the ontological status of objects, the existence of entities that transcend nature, and the generic features exhibited in experience. African and Eastern philosophers usually have conceived of metaphysics (in the sense implied by the word's etymology) as more closely interwoven with the axiological (or value-laden) character of the cosmos and the moral quality of human community.

A distinctive feature of Western metaphysics is the attempt to understand the universe by means of a logical investigation of concepts rather than an empirical inquiry based on sensory evidence. Such metaphysical sentiments rest upon a relative distrust of the variable, visible, and sensible world and involve a quest for the invariable, invisible, and intelligible world. They also assume a basic unity of thought and being, of logic and the world. Rationally coherent and logically consistent systems of thought are believed to reveal the way the world really is.

The origins of Western metaphysics go back to Parmenides of Elea (c. 515–475 BCE). In the poem usually titled *On Nature*, Parmenides provides the first exemplary philosophical argument of Western metaphysics. In the form of a journey to the heavens to receive wisdom from "the goddess," Parmenides attacks the reality of the physical world, condemns difference as illusory, and proposes that fundamental reality is invariable, invisible, and intelligible, as well as sin-

gle, indivisible, and homogeneous. This metaphysical viewpoint rests upon the deployment of the basic binary opposition of reality and appearance, in which the realm of the former is qualitatively different from and superior to the realm of the latter.

Parmenides' metaphysical conception of being, grounded in his logical reasoning and monistic conclusions, has been a major influence in Western metaphysics. This Parmenidean legacy can be seen in Plotinus's One, Spinoza's God, and Hegel's Absolute. The most immediate influence of Parmenides is found in Plato's *Phaedo*, in which, despite subtle gradations, the reality/appearance distinction is appropriated to undergird the existence of a separate order of Forms accessible only to the mind and more real than the senses. In his heroic efforts to refute the skepticism of the Sophists, Plato (427–347 BCE) extends the ontological binary opposition of reality/appearance to epistemology, morality, and politics, thus including distinctions such as knowledge/opinion, nature/convention, and philosopher/sophist. In this way, Plato's metaphysics, like that of some African and Eastern thinkers, is inseparable from ethics and political philosophy.

The religious significance of Plato's metaphysics is his doctrine of recollection, which defends the immortality of the soul. In *Meno*, Plato portrays Socrates interrogating a slave boy, an interrogation that results in the boy arriving at a geometric truth. Socrates then argues that since this truth was not told to the boy but rather elicited from him, the truth must reside in the boy at birth and in a previous existence: his questions merely prompted the boy to remember what he had forgotten from an earlier life. Similar arguments, related to the existence of a separate order of Forms, are found in the *Phaedo*, while a more speculative account of the transmigration of souls, life after death, and the soul fleeing the bondage of the body is put forward in the tenth book of the *Republic*.

Aristotle (384–322 BCE) set forth the first Western metaphysical system, including a new vocabulary, an articulation of the central issues, and a thorough treatment of these issues. He conceives of metaphysics as a "first philosophy" that investigates the fundamental principles presupposed by the other sciences. Aristotle's metaphysics can be viewed as a profound and persistent polemic against the notions of indeterminacy and infinity. Its aim is to establish a fixed beginning point, the limits of inquiry, the determinateness of concrete individual objects, and the termination of epistemic chains of justification. Aristotelian notions of causality (material, formal, efficient, and final), substance, being, essence, form, and actuality set the terms for Western metaphysical discourse through the twentieth century. The legacy of Aristotle's metaphysics in religious thought is found most clearly in the Christian systematic theology of Thomas Aquinas and the neo-Thomist tradition of the Catholic church exemplified in thinkers such as Étienne Gilson (1884–1978) and Jacques Maritain (1882–1973).

The last great metaphysical system of classical antiquity was the Neoplatonism best represented by the Hellenized Egyptian philosopher Plotinus (205–270 CE), his pupil Porphyry (232–306?), the Syrian school of Iamblichus (250–330?), the Athenian school of Proclus (c. 410–485), and the Latin Christian school of Boethius (480–524). This system (and its various versions) is rooted in Plato's devaluation of the sensible world and elevation of the intelligible world. Yet, as in certain themes in Plato's second and seventh letters, Neoplatonism promotes a kind of mysticism and asceticism that deeply influenced the Christian theology of the African thinker Augustine (354–430). This mysticism is based on an intuition of the unity and wholeness of being, the One, which differentiates itself downward into lesser degrees in spirits, souls, and, lastly, physical objects. This process of emanation from undifferentiated unity to modes of differentiated disunity results in a return (or epistrophe) to unity and wholeness.

The Syrian philosopher Porphyry not only made Plotinus's lectures available but also wrote a short introduction to Aristotle's *Categories*, titled *Isagoge*, that directed attention to the relation between the essential and accidental attributes of things and the status of universals. This influential text, translated into Latin by Boethius, provided the framework and language for metaphysical reflection in the early Middle Ages by Christian theologians such as John Scottus Eriugena (fl. 847–877), Anselm (c. 1033–1109), and Bonaventure (c. 1221–1274).

The thirteenth-century translations of Aristotle and his Arabian commentators into Greek and Latin by Robert Grosseteste and William of Moerbeke facilitated the crowning achievement of Western metaphysics in the late Middle Ages: the magisterial system of Thomas Aquinas (c. 1224–1274) and the critical nominalism of William of Ockham (c. 1280/1285–1349?). Thomas creatively appropriated Aristotelian metaphysics into a Christian philosophy, whereas William paved the road for the new "modern way" (*via moderna*) by separating metaphysics from Christian faith and thereby emphasizing religious faith and church tradition. William influenced major figures of the Reformation.

The modern conception of metaphysics in the West begins with René Descartes (1596–1650), who tried to apply the rigor and standards of mathematics and geometry to metaphysical claims. Descartes's quest for indubitability within the immediate awareness of a thinking self and his call for clarity and distinctness in truth-claims reflect an ingenious and influential philosophical response to the rise of modern science, especially the wedding of quantitative models with physics and chemistry. Barukh Spinoza (1632–1677) and Gottfried Wilhelm Leibniz (1646–1716) followed the Cartesian project of scientific rigor and philosophical boldness by setting forth deductive metaphysical systems. Spinoza's mechanical and deterministic view of the universe, in which the only two known attributes of substance are thought and extension, yielded a pantheistic con-

ception of God as identical with nature. This conception would inspire later forms of German idealism. Leibniz's rationalist commitments to a priori reasoning, the analysis of concepts according to logical necessity and rational intelligibility, produced refined versions of ontological arguments for the existence of God that sharpened modal logical tools for subsequent efforts by Christian theists.

The crisis of modern Western metaphysics begins with the major empiricists: John Locke (1632–1704), George Berkeley (1685–1753), and, especially, David Hume (1711–1776). All three assumed the Cartesian starting point for philosophical reflection as within the arena of immediate awareness of a thinking self. But in contrast to Descartes, Locke argues that sense impressions are the primary data for knowledge of the world, self, and God. This restriction requires that we cannot have “clear and distinct ideas” of substance and essence, only empirical access to their properties and powers. Therefore, the most privileged notions in traditional Western metaphysics, such as substance and essence, were rendered problematic. Berkeley further questioned the distinction between ideas of objects and properties of objects that cause ideas, thereby radically calling into question material substance. Hume changed the course of Western metaphysics by dissolving philosophical conceptions of the self, subject, and mind into mere bundles of sensations and perceptions. By replacing philosophical notions of necessity and causality with psychological accounts of imagination and sociological notions of habit and custom, Hume defended an inescapable skepticism regarding the possibility of metaphysics. This position presented religious thinkers with the options of a rational agnosticism or a nonrational religious faith.

The significance of Immanuel Kant (1724–1804) lies in his rescue of Western metaphysics by specifying the limits of human knowledge. This rescue took the form of rejecting the dogmatism of Cartesian metaphysical projects and circumscribing the skepticism of Hume's empiricism. The result was a critical idealist metaphysics that preserved the objectivity of knowledge-claims yet prevented human access to ultimate reality. The aim of Kant's metaphysics was to disclose the universal conceptual scheme that people employ in theoretically ordering the world and practically acting within it. For Kant, religious faith became a mere appendage to ethics, a practical postulate for moral behavior.

The last great metaphysical system in the modern West—a response, in part, to Kant—was that of Georg Wilhelm Friedrich Hegel (1770–1831). Like Plato, Aristotle, and the Neoplatonists, Hegel attempted to penetrate to the fundamental nature of reality by means of rational deliberation. Yet he conceived of this reality as a historical and dialectical process intelligible only to the discerning and retrospective philosopher. Hegel's metaphysics emphasized the radical dependence of God upon the world and promoted a divine immanent presence in human history.

Western metaphysics has been under severe attack since Hegel. Apart from the ambitious project of Alfred North Whitehead (1861–1947), the vitalistic program of Henri Bergson (1859–1941), the versions of logical atomism of Bertrand Russell (1872–1970) and the early Ludwig Wittgenstein (1889–1951), and Paul Ricoeur's (b. 1913) recent metaphysics of narrativity, post-Hegelian philosophy has been strongly antimetaphysical. The Christian existentialism of Søren Kierkegaard (1813–1855) and the transcendental phenomenology of Edmund Husserl (1859–1938) inspired the ontological hermeneutics of Martin Heidegger (1889–1976), which claims to have “destroyed” the Western metaphysical tradition. The logical positivism of the Vienna Circle (Otto Neurath, Moritz Schlick, Rudolf Carnap, and others) and ordinary-language philosophy served as stepping-stones for the later Ludwig Wittgenstein's linguistic conventionalism, which claims to have “dodged” the bewitching traps of Western metaphysics. The perspectivism of Friedrich Nietzsche (1844–1900) and the structuralist vocabulary of Ferdinand de Saussure (1857–1913) provided resources for the present-day poststructuralist skepticism of Jacques Derrida (1930–2004), which claims to have “deconstructed” the Western metaphysical tradition. Lastly, the pragmatism of William James (1842–1910) and John Dewey (1859–1952) and the epistemological holism of W. V. Quine (1908–2000) and Nelson Goodman (1906–1998) are employed by Richard Rorty (b. 1931) in his contemporary attempt to “demythologize” the Western metaphysical tradition. Whether the influential attacks of Heidegger, Wittgenstein, Derrida, and Rorty on Western metaphysics are skeptical moments in the history of Western philosophy (like those of Pyrrho and Montaigne in times past) or proleptic precursors of a new stage remains an open question. The religious significance and implications of these attacks—within and outside the West—remain relatively unexplored.

CORNEL WEST (1987)
Revised Bibliography

METEOROLOGICAL BEINGS. Religious people of very different times and cultures have tended to “humanize” meteorological phenomena by telling stories about the displays of celestial power and fruitfulness they witnessed, converting those events into elements of a sacred narrative intended to explain how the world and humankind have come to be the way they are. The experience of life in a properly religious world differs radically from our experience of life today. For one thing, it makes no distinction between the natural and human realms. Whereas for us a storm is invariably an “it,” the storm has been much more a “thou” for the better part of human history. It is not the storm that religious people have worshiped but the sacred power, will, and qualities that are somehow revealed there, although it would be quite incorrect to speak of the “personification” of inanimate nature or, for that matter, to invoke some sort of animistic theory to explain why meteorological phenomena play the important roles in religious life that they do. For religious people, storms are everywhere manifestations of the sacred. As such they engage the whole human person—meaning his or her emotional, imaginative, and intellectual faculties taken together—in a vital relationship.

Moreover, the various qualities of storm and rain have suggested, both to our religious forebears and to our contemporaries living in the so-called traditional societies, countless analogies that have enabled them to express—perhaps even to discover—certain important truths about their experience of life and their religious aspirations. For example, by analogy with atmospheric lightning, Iglulik Inuit shamans refer to a mystical experience called *qaumaneq* (“lightning” or “illumination”) that confers clairvoyance. Indeed, lightning, or dreams about it, typically figures in shamanic initiations or callings; and by the same token the rapidity or suddenness of spiritual “illumination” has been compared to lightning in many of the religions of history.

Storms have both a benign, life-sustaining aspect, because they bring rain, and a dark, chaotic one, owing to their

potential for destruction. The high winds and distant roll of thunder that in one instance may announce an imminent end to prolonged drought may in another have inspired an apocalyptic vision, or a collective memory preserved in myth, of the world’s complete destruction by flood. The storm gods, for their part, often garner trust as senders of the moisture upon which living things depend, but just as often they are feared as agents of divine punishment, retribution, or simply inexplicable malevolence. Symbols derived from the phenomena of storm thus express quite effectively humankind’s deeply rooted ambivalence toward the sacred. Or, put another way, they express the profound anxiety that men and women have felt about the sacred powers that sustain the world, powers over which human beings have little if any control.

Finally, and what is most important, storm symbols function the way other religious symbols do in making it possible for the human situation to be translated into cosmological terms and vice versa. They reveal a fundamental oneness between human life and the structure of the world and so have led people out of their isolation in subjectivity, beyond the human condition as it were, toward a stance vis-à-vis their own experience of life that one could easily describe as a kind of transcendence. That much, at least, accounts for the essentially religious character of these symbols.

In this article I propose to continue the morphological description of sky symbols begun elsewhere, concentrating now on the divine figures connected with dramatic meteorological events, chiefly thunder, lightning, and rain. No single explanation can account for the uniformity and variety of the storm gods in history. Some are also supreme beings, some appear in animal guise. All of them display in varying proportions what I have chosen to call “two kinds of sovereignty,” the one more “spiritual” and derived from the ideas and values associated with the sky and sky gods, the other more “physical” and connected with the earth and its fertility.

STORM DEITIES AND THEIR FORMS. If all the sky gods were arranged on a line according to their dominant powers and attributes, the result would be a broad array with, at one end, deities who display most fully the characteristics that make them creators, sovereigns, lords of the universe, law givers, and moral overseers. To the second half of the array would belong a collection of progressively more varied and colorful deities whose chief traits describe a generative, vitalizing mission in the world. These latter are typically male deities, often spouses of the Great Mother, and givers of rain, hence prone to develop into more specialized storm gods and fecundators. All are epiphanies of force and violence, those necessary sources of energy on which biological life and civil order in the world depend; and, over a broad geographical expanse throughout Africa, Europe, and Asia, many have a connection with the bull. (The bull and the thunderbolt appear historically very early in connection with the storm gods. The Kannada word *ko*, which means “ox, sky, or lightning, ray of light, water, horn, mountain,” preserves intact the full semantic range of this complex of symbols.)

The so-called specialization of the sky gods either in the direction of *dei otiosi* or into the gods of storm and rain derives from the ambivalent structure of the sky symbols generally and has led scholars to speak of the "passive," transcendent nature of the sky gods and, conversely, of their tendency to give way to more active, vital divine forms. Of course nowhere in history does one find either specialized type, the far-off ruler whose celestial attributes predominate, or the storm god-fecundator, in isolation; invariably there are mixtures of the two. Sometimes both functions belong to a single deity's sphere of activity; elsewhere a rather clear division of labor prevails, with the storm god usually subordinate to a celestial ruler who is often the storm god's father. In certain cases the storm deity represents the exercise of legitimate force on behalf of some higher authority; in other cases his link with agriculture is more important.

Specialization usually brings with it a radical change of form: that is, the storm gods can be said to have abandoned absolute transcendence in favor of powers and attributes that did not belong to their original celestial make-up. For that reason they are apt to betray foreign influences too. For example, Parjanya, the Indian god of hurricanes and son of Dyaus, the ancient Indo-Aryan sky god, was said to rule the waters and all living things. He made the whole universe tremble with his storms. His specialization, though, rendered him no longer omniscient like his father (with whom the authors of the *Rgveda* sometimes confused him) nor a sovereign like Varuṇa. As a result, in Vedic times he yielded his place to Indra, a warrior king, also god of rain and easily the chief god of the *Rgveda*. Indra, for his part, is always compared to a bull or a ram, two animals associated with Rudra, a non-Aryan divinity, many of whose attributes Indra would absorb over the course of time. In fact Indra's connection with bulls, soma, and the Maruts (to the degree they personified the wandering souls of the dead) would suggest that he also acquired certain lunar prerogatives: that is, Indra *qua* symbol expanded in the direction of a larger integrated expression of life's power and sacrality, one that included even elements belonging to the symbolism of the moon.

The point is that storm gods, no matter how early in time they appear and no matter what type of culture they belong to, always show evidence of long and complicated histories. Thus, in using the term *specialization* here to account for the forms the storm gods take, I do not mean to imply that storm, rain, and fertility gods are necessarily late developments, for we have no reason to doubt the antiquity of dramatic, stormy elements in the sky god's make-up. There is a unity of structure to the sky symbolism that we can only assume has been present from the very beginning, and that unified structure includes both distant supreme sovereignty and active, even violent, involvement with life processes in the human world.

METEOROLOGICAL PHENOMENA AS ATTRIBUTES OF A SUPREME BEING. Some religious people have seen none other than the supreme sky deity behind the stormy atmospheric

displays that, for them, attest to his all-knowing presence, will, and power. The Andaman Islanders know such a deity in Puluga, whose breath is the wind and whose voice is thunder. Hurricanes signal his anger, and lightning bolts are the punishment he executes against those who violate his laws.

The tribes of Southeast Australia report that Baiame created all things out of nothing, but Baiame is creative in another sense, for in causing the rain to fall he makes the whole earth new and green. Natives can discern his voice in thunder. On the east coast of Australia other tribes worship Daramulun, who also speaks in thunder and sends them rain. Daramulun is said to have created the first ancestor during his stay on earth, giving him the laws and customs that have passed from one generation to the next ever since. Most importantly, Daramulun left behind the initiation ceremony, which entails, among other things, a solemn display of the bull-roarer, said to make a noise like thunder and to represent the supreme being's continued presence among his people. Indeed, almost all the Australian sky gods communicate their presence in thunder, lightning, the wind and the rainbow, which is to say that meteorological traits belong inseparably to their supreme, celestial modes of being.

THE AMBIVALENCE OF THE STORM DEITIES: CREATIVITY AND CHAOS. Stormy attributes help to express the dual nature of supreme beings, who on account of their power over life and death are apt to inspire both trust and fear in equal measure. For example, the Maasai of Kenya pray to a supreme being named Ngai ("sky" or "rain") who lives high above our world where the winds circulate through his nostrils. Lightning is the dreadful glance of his eye, thunder a cry of joy at something he has seen, and raindrops are the joyful tears he sheds at the sight of fat beehives during the rainy season when cattle grow sleek. By analogy with the sky's polychrome appearance, the Maasai refer to a black, red, gray, and white Ngai, but they ultimately reduce those four to the black and red Ngai alone, two opposed and complementary forms of deity. The black Ngai is good because, like the black, cloudy sky, he brings rain; whereas the red Ngai, like the red, hot sky, withholds it. (In Babylonian mythology it is the gigantic bird Imdugud that rescued human beings from drought. It covered the sky with the black storm clouds of its wings and consumed the Bull of Heaven, whose hot breath had scorched the crops down below.)

The Inca of pre-Columbian times worshiped Illapa (whom the Aymara knew as Thunupa). Both dreaded as a storm god and adored as a bringer of rain, Illapa was pictured as a man with club and sling who draws water from a heavenly stream (the Milky Way) using pitchers that he leaves in the safekeeping of his sister until he breaks them with his thunder club.

By some early accounts the Aztec rain god Tlaloc has four pitchers, and according to the one he uses, the result will be a good maize crop or a harvest spoiled by vermin and frost. No Aztec deity enjoyed a more active or widespread cult than he. Tlaloc, the giver of rain, but also the wrathful

deity of lightning, was conceived in multiple form as *tlaloques* (lesser, sometimes dwarflike, storm deities) assigned to the four directions, or as the leader of a group of *tlaloques*, who were said to dwell on mountaintops in caves, where storm clouds brew. Descriptions of Tlaloc's heavenly paradise supply further clues about his ambiguous nature. It is a place of infinite abundance and perpetual verdure where those who had died by drowning or had been struck by lightning or were suffering from such afflictions as leprosy, venereal disease, skin ailments, gout, and dropsy enjoyed eternal happiness. They were the only dead whom the Aztec did not bury; all others were cremated.

According to Juan Ignacio Molina and other writers of the second half of the eighteenth century, the Mapuche knew a supreme being with many forms of address. One of his epithets, "two faces" (black and white), apparently referred to the rain and sunshine prayed for in public rites but also to the deity's ambivalent attitude—both indulgent and severe—toward his worshippers. Older sources dating back to the seventeenth century call this deity Pillán; he was said to produce thunder and lightning and all manner of violent and destructive weather phenomena such as volcanic eruptions, river floods, tidal waves, and epidemics. On the other hand, Pillán was considered a protector of the crops and hence a beneficent weather god as well.

TWO KINDS OF SOVEREIGNTY. It is not uncommon for storm gods to display this dual character, especially in parts of the world where sudden, unpredictable shows of meteorological force dominate the landscape and must surely have compelled people to theological reflection. For example, by contrast with the reassuring periodicity of the Egyptian cosmos, the environment in which Mesopotamian civilization grew and flourished could only have led men and women to conclude that order was not a given but rather something to be achieved through the continual integration of many different competing wills, each one powerful and frightening. As a result, the Mesopotamians envisioned a huge cosmic state that included human beings, animals, inanimate objects, natural phenomena, and even such abstractions as justice, righteousness, and the form of a circle. An assembly of gods presided over this "state," led by Anu (An), the god of heaven, and next to him in rank, Enlil his son, the god of storm. So far as the Mesopotamians were concerned, Enlil had revealed himself both in nature and in history. The violence that fills a storm and is expressed there *was* Enlil.

But a meteorological analogy also made it possible to interpret such catastrophic events as the destruction of Ur by the Elamite hordes sweeping down from the eastern highlands as Enlil's handiwork too: that is, in some deeper, truer sense those barbarians were also a storm, Enlil's storm, in and through which the god himself had executed a verdict passed on Ur and its people by the divine assembly. In keeping with the Mesopotamian vision of a cosmic bureaucracy, Enlil's specialized juridical role was distinguished from that of another deity, Enki, known as "lord of the earth," who admin-

istered the waters, specifically, rivers, canals, irrigation, and the organization of all productive forces. Enki's ministerial role derived from the sovereignty exercised by Anu and Enlil. Anu and, later, Marduk represent the magical or "spiritual" component of that sovereignty, whereas Enlil's sovereignty is of a more physical kind; and the latter's stormy attributes, though in this case they have little to do directly with fertility, have everything to do with the problem of legitimate force, especially the legitimate force that must have been an important concern—and a deep source of anxiety—for the citizens of such a highly regulated cosmos.

While it is true that in many cases the sky god withdrew in favor of storm gods and other divinities with more specific and concrete functions, in other instances the sky god assumed a new role. That is certainly what happened in the Greek and Roman traditions, where Zeus and Jupiter stood for both kinds of sovereignty, being at once divine guarantors of cosmic order, supreme rulers, moral arbiters, even personifications of law, as well as gods of rain and fertility. Zeus preserves in his name the Sankrit root *div* ("shine" or "day"), leaving no doubt as to his celestial nature and shared heritage with the ancient Indo-European sky god Dyaus. However, scholars in the past were so quick to seize upon the etymology of Zeus's name as the key to his religious significance that they usually inquired no further into Zeus's unique and complicated mode of being, much of it vividly expressed in his meteorological attributes.

The many epithets for Zeus in Homer explain why he came to be equated with weather deities elsewhere in Asia Minor: he is called at various times Ombrios and Hyetios ("the rainy one"), Ourios ("he who sends favorable winds"), Astrapios ("sender of lightning"), and Bronton ("thunderer"). Other epithets tell of an affinity with crops and the dark earth: Georgos ("the farmer"), Chthonios ("earth-dweller"), and even Zeus Katachthonios ("the underground Zeus"). Zeus's theriomorphic aspect—he is sometimes a bull, as in the myth of Europa, or a wolf to whom sacrifice was performed in time of drought or storm—is further evidence of his link to agriculture and rain.

The transforming quality of lightning that accounts for its role in shamanic initiations may help to explain yet another of Zeus's prerogatives, for whatever was used to purify from sin and much of what pertained to rites of initiation fell directly or indirectly under his control. Lightning marked his direct epiphany, and wherever it struck, a sanctuary was raised to Zeus Descending.

The whole complex of ideas, powers, and attributes belonging to Zeus's stormy aspect reappears on a different level of symbolic expression in the divine twins. The Dioscuri, or "Zeus's sons," like many other pairs of mythic twins, issued from the union of a god and a human mother and thus represented in a peculiar way the sacrality of the sky god on earth. In the Indo-European tradition, the twins are usually sons of the sky god, warriors, magic healers, saviors, and fertility gods; as gods of light, they are often associated with the

dawn, the morning and evening stars, and the pair, thunder and lightning. The Dioscuri, for example, became popular as rescuers from personal distress, especially from danger at sea. Saint Elmo's fire, the electric discharge from the ship's mast during a thunderstorm, was widely regarded as their corporeal epiphany. Also, like Herakles, they were said to have been initiated at Eleusis. The various pairs of divine twins in the Indo-European tradition—the Germanic Freyr and Njord, the Vedic Asvins, and the Dioscuri, to name three—were invoked to witness the swearing of oaths. Likewise, at Olympia a statue of Zeus Horkios (“Zeus of the oath”), before which competitors took their oaths, had in either hand thunderbolts with which to punish false swearers; and according to the Homeric formulas of oaths, Zeus was always the first deity called upon to guarantee an oath and punish any violation that might occur.

In ancient Rome when a building was struck by lightning, fulgural ritual prescribed that an opening be made in the roof over the spot so that the god could always have free access to the place he had chosen for his sanctuary. The most solemn oath was that sworn in the name of Iuppiter Lapis (“Jupiter present in the thunderstone”). The sacred stone was used when the *fetiales* took an oath and made sacrifices upon allying themselves with a foreign power. We know from Vergil that such an alliance received its highest sanction from the storm god himself. The priest, pronouncing a curse on the contractor who should first violate the sacred compact, hurled the stone at the sacrificial swine saying, “Jupiter, strike down the Romans as I now strike this pig, and strike them more heavily, for your power is greater than mine.” This action represented in ritual form the stroke of lightning, and it has survived in the practice of Masurian (East Prussian) peasants who hurl a stone ax in a ritually designated manner against the door to protect their homes from lightning. Comparable practices are documented for other traditions.

Yahveh developed along lines that in some ways parallel the development of Zeus and Jupiter. Throughout the history of Israel, he shows himself a god of sky and storm, omnipotent creator, absolute sovereign, author of the norms and laws that make human life possible and good. By contrast Indra's exaggeratedly “physical” sovereignty develops into a personification of cosmic and biological energy. Indra is not a creator; instead the creative function is specialized in Indra's case into a generative, vitalizing one. Of course the *Rgveda* does feature a sky father called Dyaus Pitr, a cognate form of *Zeus Pater* and *Jupiter*, but by Vedic times Indra had already assumed the role of celestial sovereign in India, and storms are the supreme manifestations of his creative force. He wields the thunderbolt, frees the waters, absorbs fabulous amounts of soma, fertilizes the fields and bestows fertility on human women, displays fantastic sexual powers himself, and leads an army of lesser storm gods, the Maruts, to victory for the Indo-Aryan invaders.

The Germanic deities Óðinn (Odin) and Þórr (Thor) offer a clear example of a storm god's specialized function

and the two kinds of sovereignty implicit in this cosmic division of labor. Óðinn belongs primarily to a category of divine sovereigns that includes the Chinese Tian, the Indian Varuṇa, and Ahura Mazdā of Zoroastrian belief, although in the course of his development, he took on certain attributes of agricultural and fertility gods as well, becoming in the process a chthonian master of the souls of dead heroes. Óðinn typifies what the great Indo-Europeanist Georges Dumézil has called “the magical sovereign” because, like Varuṇa, he employs the power to bind and discerns the future. Þórr, on the other hand, god of tempests and combat, represents a second, more physical and less spiritual, kind of sovereignty, and his “physicality” takes in more than his martial qualities. Modern Scandinavian folklore studies, the remnants of old agrarian cults, and archaeological findings have all tended to prove that Þórr was originally much more than a warrior. Through rain, the happy side-effect of his atmospheric battles and the exploits of his hammer, he assisted the growth of crops; and Swedish peasant names for him recall the Saami (Lapp) cult dedicated to a fertility god who gives rain or sun according to the needs of the soil and sees to it that growing things mature and bear fruit.

STORM ANIMALS. The world's mythology and folklore describe a whole host of animals associated with thunder, lightning, and rain. The goat, the ram, or horses, for example, frequently accompany the storm god or pull his thundering vehicle across the sky. But the most common and widespread of the storm animals are probably the thunderbird or woodpecker, the dragon, and the bull.

North American Indians worship various supernatural beings in avian guise who produce thunder by the whirl of their wings and lightning with flashes—a winking or twinkling—of their eyes (Cree, Hare, Tlingit, and other tribes). The distribution of this thunderbird belief is very wide, but the kind of bird in question ranges from a crane (Pawnee), jackpine partridge (Beaver), or humming bird (Lilloet) to a gigantic eagle (Sauk, Hare, and others). In eastern North America, the thunderbirds are typically four in number, one for each of the cardinal directions; and over the same region, they are considered to be locked in a cosmic struggle with evil water spirits, panthers, or horned serpents. This antagonism on the level of myth finds cultic expression in the division into sacred moieties characteristic of the eastern tribes who rely on agriculture for their subsistence. However, it may also reflect a dualism known elsewhere in world mythology that usually pits the thunder god against a reptilian water monster (the way Indra opposes Vṛtra or the way Marduk battles Tiamat). The same sort of struggle recurs, for example, in northern Siberia and among the Buriats around Lake Baikal, this time between the ruler of birds (a great eagle) and a many-headed water snake. The thunderbird motif also appears in the Gran Chaco, in Ecuador, and among the Carib-speaking peoples on the northern coast of South America. In fact the thunderbird's range would seem to indicate it was a much more vital presence in the minds and hearts of religious people in earlier times than now.

Across Europe, around the Mediterranean, and in parts of Inner Asia, at least, the woodpecker was believed to have supernatural powers because of its association with thunder, rain, and fertility. There is much evidence to suggest that the belief arose in Neolithic times with the spread of cultivation by means of the hoe and, later, the plow. In many places the woodpecker also has a connection with divine twins and, like the storm gods, with war and agriculture. For example, according to Roman legend Romulus and Remus were cared for not only by the she-wolf but also by the woodpecker; and Mars, god of war and at one time a god of agriculture, was said to have fathered the two by the vestal virgin Rhea Silvia. In other words the woodpecker has a dual nature corresponding to the storm's ambivalent values: destructive power and fertility.

Among the classes of dragons in China, there is first the dragon (*jiao*), originally an evil, snakelike creature that lived and always stayed in water. Then there is a river-god dragon, the *long-wang*, a form strongly influenced by the Indian *nāga*, originally a snake and, in fact, a version of the *jiao* that spread to India along with other elements of coastal culture. Under Indian influence the *jiao* dragon became a *long-wang*, or river god, with cults in many places along major waterways in China.

The *long* dragon associated with storms is neither the dragon *jiao* nor the *long-wang*. It too lives in water but has the unique ability to ascend to Heaven in the springtime and to summer there as the rain dragon. The *long* can frequently be seen in the sky during thunderstorms and is basically a benevolent animal that produces rain and ensures fertility. In the Chinese classics it sometimes corresponds to Heaven itself and therefore also to the emperor. (Later Chinese myths describe a thunder god whose characteristics derive from the wild boar, the promoter of wet-field agriculture.)

The mythologies of India, Africa, Europe, and Asia regularly associate a divine bull with the gods of the atmosphere and fertility, Indra and Rudra being two such examples. In pre-Aryan India the cults of Mohenjo-Daro and Baluchistan included important bull cults, and temples dedicated to Śiva are full of his bovine images. At Ur in the third millennium, the god of the atmosphere was a bull; in ancient Assyria men swore by a god in the form of a bull; and the supremacy achieved by such storm gods as Teshub, Hadad, and Baal in the religions of the Near East is notable for their connections with bulls. What is venerated in these and other bull gods of lightning who are married to the great earth goddess is both their transcendence, expressed in violent weather phenomena, and their physical potential as fecundators. In other words the interdependence of the "celestial" and "generative" functions in the figure of the bull seems abundantly clear. The same could be said of storm gods and of every storm hierophany.

BIBLIOGRAPHY

I do not know of a monograph devoted to the storm gods or to the symbolism of meteorological phenomena. One general source, however, is Mircea Eliade's "The Sky and Sky Gods," chapter 2 of his *Patterns in Comparative Religion* (New York, 1958), pp. 38–123. A bibliography devoted specifically to storm gods in the Near East and their relation to the bull can be found on page 120. Other general sources are James G. Frazer's *The Worship of Nature*, vol. 1 (New York, 1926), Raffaele Pettazzoni's *The All Knowing God*, translated by H. J. Rose (London, 1956), and C. Blinkenberg's *The Thunderweapon in Religion and Folklore* (1911; New York, 1977).

Literature on the divine twins is quite extensive. Two old but still fascinating studies are Rendel Harris's *The Cult of the Heavenly Twins* (Cambridge, 1906) and *Boaergeres* (Cambridge, U.K., 1913). For excellent bibliographies on the subject, see Donald J. Ward's *The Divine Twins: An Indo-European Myth in Germanic Tradition* (Berkeley, 1968) and Raymond Kuntzmann's *Le symbolisme des jumeaux au Proche-Orient ancien: Naissance, fonction, et évolution d'un symbole* (Paris, 1983).

On the range of the thunderbird belief, see Trumen Michelson's *Contributions to Fox Ethnology II*, United States Bureau of American Ethnology (Washington, D.C., 1930), pp. 51–56. For its religious meanings, a reliable source is Åke Hulkrantz's *Religions of the American Indians*, translated by Monica Setterwall (Berkeley, 1979).

On the woodpecker as a thunderbird, see "The Thunderbird," chapter 6 of Edward A. Armstrong's *The Folklore of Birds: An Enquiry into the Origin and Distribution of Some Magico-Religious Traditions*, 2d ed., rev. & enl. (New York, 1970), pp. 94–112. See also Rendel Harris's *Picus Who Is Also Zeus* (Cambridge, U.K., 1916).

The standard work on the dragon in China and Japan is still M. W. de Visser's *The Dragon in China and Japan* (Amsterdam, 1913). A more recent and probably more useful source is Wolfram Eberhard's *The Local Cultures of South and East China*, translated by Alide Eberhard (Leiden, 1968), pp. 238–250.

Revised Bibliography

METHODIST CHURCHES. Methodism arose from the search of John Wesley and his brother Charles for

a deepened religious life within the ordered ways of the Church of England, which John described as “the best constituted national church in the world.” He sought no drastic reform in doctrines but rather a greater emphasis upon a personal experience of God’s saving and perfecting grace and more opportunity for a spiritual quest within Christian groups, undeterred by denominational barriers. He downplayed the divisive element of his movement, publishing in 1742 an elaboration of Clement of Alexandria’s description of a perfect Christian as *The Character of a Methodist* and offering this simple definition in his *Complete English Dictionary* (1753): “A Methodist, one that lives according to the method laid down in the Bible.”

John Wesley, both as the living leader and later as the almost legendary “Mr. Wesley” of “the people called Methodists,” so greatly influenced the developing thought of Methodism that he demands a far greater proportion of attention than if he had been the mere titular founder of a new denomination.

After his heart was “strangely warmed” on May 24, 1738, Wesley began to preach salvation by faith with the conviction of personal experience, and he gathered around him an organized society in London, the first of many that spread throughout the British Isles. These societies were intended to supplement, not supplant, the worship of the church. In his *Rules* (1743) he argued that a society was simply “a company of men ‘having the form, and seeking the power of godliness,’ united in order to pray together, to receive the word of exhortation, and to watch over one another in love, that they may help each other to work out their salvation.” There was only one condition for membership, “a desire . . . to be saved from [their] sins.” To test and reinforce his followers’ sincerity, however, the *Rules* insisted that members should avoid evil, do good, and seek holiness, for which illustrative examples were given in all three categories.

In order to proclaim his message and administer his societies Wesley enrolled a steadily increasing number of lay preachers to join the handful of sympathetic clergy who engaged in an itinerant evangelical ministry under his supervision. In 1744 he called these together in London to confer about doctrine and organization. This was the first annual conference of Wesley’s Methodism, although the Welsh Calvinistic wing of the movement, who looked to George Whitefield as their chief inspirer, had been holding their “Associations” for several years.

The primary purpose of the Conferences of 1744–1747 was to formulate the major doctrinal emphases of Methodist preaching: salvation by grace through faith, confirmed and exemplified by good works; the witness of the Holy Spirit to a person’s salvation from the penalties of past sin and to his power over present temptations to sin; and the theoretical possibility of personal triumph over temptation, under the title of Christian perfection, which Wesley defined as perfect love to God and man, though consistent with human error and with no guarantee of permanence. These doctrines, as

taught and illustrated in Wesley’s first four volumes of *Sermons* (1744–1760) and his *Explanatory Notes upon the New Testament* (1755), formed the basis of all Methodist preaching.

The early Conferences also consolidated the organization of Methodism into a *connexion*, a network of societies served by lay preachers itinerating regularly on a circuit, or round, covering a district such as a county in tours lasting from four to six weeks, but also itinerating between circuits periodically—at first every three months, then every six, and eventually every year. Each year Wesley’s own preaching and administrative journeys took him over most of England. In 1747 Ireland was added to his tour, and in 1751, Scotland. Wesley and his itinerant preachers developed a strong family identity among the societies.

This connectional unity became so strong that in 1749 Wesley published two sets of extracts from the minutes of his conferences, each with the same title—*Minutes of Some Late Conversations between the Revd. Mr. Wesleys and Others*—one summarizing Methodist teaching, the other Methodist organization. In effect they constituted a declaration that Methodism had become an established ecclesiastical body. Inevitably this process of consolidation aroused much criticism of Methodism: the preachers’ teaching, so unfamiliar to non-Methodists, was incorrectly described as unorthodox; their vigor, warmth, and ebullience were pejoratively labeled “enthusiasm”; and Wesley’s unconventional preaching in the open air and in other parishes, and, worse still, his authorizing laypeople to preach, were regarded by even sympathetic clergy as a grave breach of ecclesiastical order. Preachers and people were occasionally mobbed, but the somewhat quiescent church authorities took no concerted action.

The chief threat, indeed, came from within the movement. The people’s desire to receive the sacraments from their preachers fed the preachers’ natural ambitions to improve their status and to transform the society into a church. John Wesley was inclined to let things run their course, but the vehement opposition of his brother Charles led him to tighten the rein on his preachers, most of whom from 1752 onward signed agreements “never to leave the communion of the Church of England without the consent of all whose names are subjoined.” Avowed separation from the church was narrowly averted at the Conference of 1755, when all agreed “that (whether it was *lawful* or not) it was no ways *expedient*.” This deferred any open separation for almost thirty years.

Meanwhile, British and Irish immigrants brought Methodism to America, where it became so firmly rooted that Wesley responded to their plea for help by sending out matched pairs of itinerant preachers in 1769, 1771, 1773, and 1774, of whom by far the best known and most influential was Francis Asbury, who remained throughout the Revolutionary War (1775–1783). With some difficulty Asbury persuaded the American Methodists not to sever their ties with Wesley in their eagerness for religious independence,

and thus Wesley himself was able to assist Americans in the birth of the first independent church within Methodism.

The year 1784 was “that grand climacteric year of Methodism.” Aided by Dr. Thomas Coke, Wesley prepared a deed poll (in which one party binds himself or herself without reference to obligations undertaken by another) that legally defined the term *Conference*, and made that body heir to British Methodism after Wesley’s death. Wesley also entrusted to Coke a major part in publishing a revision of *The Book of Common Prayer* for the use of American Methodists, and discussed with him a complementary plan for securing a threefold ministry in American Methodism. Already convinced that in any ecclesiastical emergency the power of ordination resided in presbyters, Wesley ordained two of his preachers, first as deacons and then as elders. With their assistance he then commissioned Coke as “superintendent” of the American flock, with instructions to share his new authority with Asbury upon his arrival in America.

At the Christmas Conference in Baltimore (1784–1785) with Wesley’s blessing, a new denomination was launched, the Methodist Episcopal Church. In England Methodism still remained a society, governed by a presbyter of the Church of England and at least theoretically within the fold of that church. After Wesley’s death in 1791, however, under the terms of his deed poll, the Conference of preachers became the ruling body, with a modified presbyterian system of government rather than the modified episcopalian polity that was being developed in America. Although some of Wesley’s Anglican friends had occasionally referred to “the Methodist church” during his lifetime, not until 1893 did the class tickets indicating membership in the Wesleyan Methodist Society carry the word *church*.

When in 1739 Wesley had written, “I look upon all the world as my parish,” he was defending his disregard of ecclesiastical boundaries in Britain, but in fact he did also cherish a vision of a world renewed in the image of Christ, and was convinced that his liberal, pragmatic approach to theology and to churchmanship should make good missionaries of his people—as indeed it did. He heartily supported Coke’s missionary plans, and a month before his death wrote to a native American preacher, “Lose no opportunity of declaring to all men that the Methodists are one people in all the world.” Within a century after Wesley’s death immigrants and missionaries from both sides of the Atlantic had planted Methodism on each continent and in almost every country.

Methodist missionary expansion during the nineteenth century varied little whether it came from the British or the American type of church polity, because polity was overshadowed by ethos, and the ethos sprang from Wesley, Methodists everywhere remained within a tightly knit *connexion* governed by a conference. They followed Wesley in assigning major responsibilities to laypeople, and were progressive in enrolling women as leaders, and even as preachers. They emphasized evangelical preaching and continued to experiment with an adventurous and flexible organization. While mak-

ing good use of their rich heritage of Charles Wesley’s hymns they observed those almost uniquely Methodist forms of worship, the watch-night, the covenant service, and the love-feast, as well as the close fellowship of the class-meeting and the bands, with their cherished tickets of membership. They constantly remembered their early rules, by “avoiding evil of every kind—especially that which is most generally practised,” and by “doing good of every possible sort, and as far as is possible to all men.”

It is true that the full appreciation of some of these features fell off even during the nineteenth century, and a few were almost forgotten in the twentieth, such as Wesley’s constant charge, “Press on to perfection.” Human frailty brought about fragmentation into many independent denominations, a process furthered during the twentieth century by the hiving off of national churches from the parent bodies.

The first major division in England, the Methodist New Connexion (1797), was a revolt against the autocracy of the leading Wesleyan preachers, but the Primitive Methodists (1811) and Bible Christians (1819), though also favoring more lay leadership, left because they wished to restore evangelism. The Wesleyan Methodist hierarchy came under increasing attack from 1849 onward in a disruptive pamphlet warfare that led to eventual democratic reforms at the cost of losing many thousands of members. Happily, some of these breaches were progressively healed through the formation of the United Methodist Free Churches in 1857, the United Methodist Church in 1907, and the Methodist Church in 1932.

In America, where membership had almost drawn level with that in the British Isles by Wesley’s death, Methodism expanded and divided far more rapidly than in Britain during the nineteenth and twentieth centuries. The controversy over the institution of slavery and other disruptive forces similar to those in England were at work in America. Coke and Asbury had unsuccessfully sought to eradicate slavery from the Methodist Episcopal Church, but even in the abolitionist strongholds of New York and Philadelphia race remained an issue among Methodists. There, blacks forsook their second-class membership to form their own congregations, which eventually became the African Methodist Episcopal Church (1816) and the African Methodist Episcopal Zion Church (1820), with communities of 3.5 million and 1.2 million respectively, in the 1990s. In 1844 the whole Methodist Episcopal Church split north and south over the issue, though other factors were also at work, including varying views of the episcopacy. In 1870 the Methodist Episcopal Church South blessed the incorporation of their own black members into the Colored (now “Christian”) Methodist Episcopal Church. Slavery was also a factor in the formation of the Wesleyan Methodist Connection (1843), which did not name itself a church until 1947, and which also sought a return to earlier Wesleyan evangelism and the abolition of the episcopacy. The Free Methodist Church (1860) arose

after lengthy preliminaries from a widespread desire to recover Wesley's teaching upon Christian perfection. A similar emphasis within American Methodism upon the need to recover scriptural holiness led to the piecemeal formation of the Church of the Nazarene.

In American Methodism and its missions, as well as in the British Commonwealth, a measure of consolidation took place during the nineteenth and twentieth centuries, notably in the union of the northern and southern churches with the Protestant Methodists in 1939 to form the Methodist Church, which in 1968 united with the Evangelical United Brethren (itself a union of churches with a German-speaking background) to form the United Methodist Church, with a membership of eleven million out of a total world Methodist community of around fifty million. At the beginning of the twenty-first century the total world Methodist community numbered around thirty-five million.

These and other unions were consummated largely because of the coming together in Christian fellowship of representatives from dozens of autonomous Methodist churches and missions from all over the world, first decennially from 1881 in the Ecumenical Methodist Conference, then quinquennially from 1951 in the World Methodist Council. Welcome guests at these gatherings are representatives from churches where Methodism has subsumed its identity in an interdenominational union, such as the United Church of Canada (1925), the Churches of North and South India, the Uniting Church in Australia, or other such unions in Belgium, China, Ecuador, Japan, Pakistan, the Philippines, and Zambia. As an important element in the World Council of Churches, Methodism remains true to the spirit of its founder, who gloried in the catholicity of his early societies, open to persons of all creeds, and who firmly maintained, in spite of attacks by his critics, that "orthodoxy, or right opinions, is at best but a very slender part of religion."

BIBLIOGRAPHY

A valuable summary of the history, doctrines, spread, activities, and leaders of Methodism in its many branches through more than two centuries can be found in *The Encyclopedia of World Methodism*, 2 vols., edited by Nolan B. Harmon (Nashville, 1974). The unplanned development of Methodism from a movement into a denomination is described by Frank Baker in *John Wesley and the Church of England* (Nashville, 1970). Fuller details of some British aspects of Methodism, especially in their later stages, are given in *A History of the Methodist Church in Great Britain*, 3 vols., edited by Rupert Davies and Gordon Rupp (London, 1965–1984), and the rise and development of the main stream in the United States is portrayed in *The History of American Methodism*, 3 vols., edited by Emory Stevens Bucke (Nashville, 1964). The latter work should be supplemented by Frank Baker's *From Wesley to Asbury: Studies in Early American Methodism* (Durham, N.C., 1976), which traces the transition of British

Methodism to the American scene, and by Frederick A. Norwood's *The Story of American Methodism* (Nashville, 1974), which traces later developments in the history of the United Methodists.

METHODIUS SEE CYRIL AND METHODIUS

MEYKAṆṬĀR (thirteenth century CE), Tamil Śaiva Siddhānta author and theologian. Meykaṇṭār ("he who saw the truth") was the first of the four *santāna ācāryas* ("hereditary teachers," here referring to four successive theologians) of the Tamil Śaiva Siddhānta school of philosophy-theology. Originally called Svētaraṇam, Meykaṇṭār, who lived in Tiruveṅṅainallūr, received the name by which posterity recognizes him from his guru Parañcōti Muṇivar. Meykaṇṭār's prominence rests almost entirely on his composition of a single work, the *Civaṅṅāpōtam* (Skt., *Śivajñānabodha*, The understanding of the knowledge of Śiva). The *Civaṅṅāpōtam*, written in the early thirteenth century, is held to be the *mutaṅṅūl* ("primary treatise") of the fourteen theological texts that have canonical status in Tamil Śaivism. These fourteen texts are collectively called the *Meykaṇṭāsāstra*, although Meykaṇṭār is the author of only one of the fourteen, but the fundamental one, the *Civaṅṅāpōtam*.

The *Civaṅṅāpōtam* consists of twelve Tamil sūtras along with two sets of glosses, the *cūttirakkāṇṅalivu* (the words of the sūtra divided into sentences) and the *cūrṅikakai* (a brief gloss on the sentences setting forth their meaning in simple prose), as well as a commentary composed of articles (*atikaraṇam*), each consisting of a thesis (*mērkōl*), reason (*ētu*), and illustrative verses (*utāraṇam*). The twelve sūtras of the *Civaṅṅāpōtam* are also found in the *Rauravāgama*, one of the Sanskrit Āgamas also held sacred by Tamil Śaivas. Whether Meykaṇṭār translated the sūtras from Sanskrit into Tamil or the author of the *Rauravāgama* borrowed from the *Civaṅṅāpōtam* is difficult, if not impossible, to ascertain and is a subject about which there is no scholarly consensus. Suffice it to note here that possession of a Sanskrit Agamic prototype for the authoritative text is hardly surprising when one considers the concern of medieval Hindu sectarian schools to establish their legitimacy.

The *Civaṅṅāpōtam* is a highly systematic and logical presentation of basic Śaiva Siddhānta ideology. The first six sūtras establish the existence, attributes, and interrelations of

the three fundamental components of Śaiva Siddhānta ontology: *pati* (the Lord, i.e., God, Śiva), *pacu* (the soul), and *pācam* (the bondage that enslaves souls and separates them from knowledge of God). Meykaṅṭar cites the fact that the world evidences intelligible processes of creation, maintenance, and dissolution to establish God's existence. God is claimed to be both immanent in souls and yet different from them. The soul's knowledge of reality, however, is clouded by its being conjoined with an innate impurity (*cakajamalam*, i.e., *āṇavamalam*, the basic component of *pācam*). But the soul can be illuminated by the Lord's grace and overcome its bondage. The soul is thus an entity that is defined by its relations—either to “bondage” (*pācam*), “impurity” (*malam*, i.e., the structure of finite, phenomenal existence), or to the Lord (*pati*), who bestows divine knowledge and bliss. Specific aspects of the soul's realization of its *advaita* relation with *pati* are the subject of the final six sūtras of the *Civañānapōtam*. Here in germ are the basics of a Śaiva Siddhānta path of spiritual realization: the necessity of a guru who is free of bondage and hence manifests the Lord, the use of the five-syllabled mantra (“*nama śivāya*”), and above all the centrality of devotional love (*bhakti*; Tam., *anpu*) for God, and the value of associating with other *bhaktas* (devotees).

BIBLIOGRAPHY

The *Civañānapōtam* has been translated into English several times. Of these, the most complete, accurate, and accessible is *Śiva-ñāna-bōdham: A Manual of Śaiva Religious Doctrine*, translated and interpreted by Gordon Matthews (Oxford, 1948). Closely following the *Civañānapōtam* in its summary of the Śaiva Siddhānta is John H. Piet's *A Logical Presentation of the Śaiva Siddhānta Philosophy* (Madras, 1952). A valuable study of the entire canonical corpus of Śaiva Siddhānta theological texts, which also contains in appendices both the Tamil and Sanskrit sūtras of the *Civañānapōtam* and the *Rauravāgama* along with English translations, is Mariasusai Dhavamony's *Love of God according to Śaiva Siddhānta* (Oxford, 1971). A large volume on Śaiva Siddhānta thought, occasionally marred by a Protestant Christian bias but nonetheless still useful for its thoroughness and occasional insight, is H. W. Schomerus's *Der Śaiva-Siddhanta: Eine Mystik Indiens* (Leipzig, 1912).

MIAO RELIGION SEE SOUTHEAST ASIAN RELIGIONS, *ARTICLE ON MAINLAND CULTURES*

MICAH (fl. eighth century BCE), or, in Hebrew, Mikhah; Hebrew prophet whose prophecy is recorded in the biblical *Book of Micah*. Although the *Book of Micah* employs a personal approach in which the prophet occasionally speaks directly in the first person to reveal his deep feelings (e.g., 1:8, 3:8 [citations herein follow the English version]), the prophet reveals neither his personal life nor his background, in contrast to many other prophets, including his contemporary, Isaiah. He does not even provide an account of his call. We know only his general period of time as stated in the superscription (1:1), which is derived from a later hand. There is also a reference to Micah's hometown, Moresheth (cf. Moresheth-gath, 1:14), which is located southwest of Jerusalem. Interestingly, this information is repeated later, in *Jeremiah* 26:18, demonstrating the strong impact of Micah's prophecy.

According to the superscription, the period of Micah's activity was during the time of Jotham, Ahaz, and Hezekiah, kings of Judah in the second half of the eighth century BCE. It was a politically stormy time dominated by the Syro-Ephraimite war and Assyrian military threats against Judah. Yet these major military events, which underlie Isaiah's prophecy, are not specifically addressed in Micah's speeches, for he was mainly concerned with the internal situation—the social and moral injustices of the rulers of Judah. Micah's attack on the false prophets (3:5–12) is noteworthy in that he was the first to devote an entire speech to the problem.

A large part of *Micah* concerns prophecies of salvation and the “new age.” Many scholars consider the relationship between oracles of doom and prophecies of salvation to be mutually exclusive, and tend to distinguish between the oracles of doom, that is, the authentic Micah, and prophecies of salvation, which they consider later additions. As a rule, these scholars consider the major parts of chapters 1–3 (except, perhaps, 2:12–13) the core of Micah's own prophecy, with the remainder reflecting thinkers of later periods who were influenced by Micah (as in *Jer.* 26:18) and sought to update the outcome of the old prophecies.

This distinction between Micah and his later editors is based upon a particular modern scholarly understanding of the nature of the authentic prophecies. Stylistic and linguistic criteria, however, are not the decisive factors in determining the original text as opposed to additions. This distinction is based upon theme rather than stylistic literary analysis. We should, however, take into consideration the possibility that prophecies of judgment may mingle with oracles of salvation, that the prophet did not merely record his surroundings but also developed a specific perspective on the new age, which he sought to share with his audience. Micah's criticism of his present world leads to his prophecy of the new age, the period of peace and justice. A distinction between original prophecies of doom and supplementary prophecies of salvation would therefore be misleading.

Much has been written about the relationship between the two contemporaries, Micah and Isaiah, because of the

similarity between the visions of the “new age” in *Micah* 4:1–5 and *Isaiah* 2:1–4 (or 5). Since Micah’s vision is not in chapters 1–3 of *Micah*, which contain oracles of doom (considered to be the words of Micah himself), scholars tend to regard this vision as inauthentic. Isaiah’s vision is likewise regarded as an addition, since it is a prophecy of salvation. It has been stated above, however, that the distinction between oracles of doom and prophecies of salvation may be an artificial one. Notice should be taken of Micah’s conclusion: “For all the people walk each in the name of its god, but we will walk in the name of the Lord our God for ever and ever” (4:5, RSV). Insofar as this differs from Isaiah’s emphasis on the universality and centrality of the mountain of God, the house of the God of Jacob, Micah’s national approach here conveys a message that contrasts with Isaiah’s universalism. Furthermore, Micah speaks specifically about the total destruction of Jerusalem (3:2; cf. *Jer.* 26:18), while Isaiah avoids such a description of the holy city. In this context we may also question Micah’s criticism of the other prophets. For instance, when he condemns them for calling for peace (3:5), is he referring to Isaiah’s call for peace during the Syro-Ephraimite war (*Is.* 7:4–9)?

There are no definite criteria for determining where Micah’s various speeches begin and end in the text. He starts with the subject of Judah’s military troubles, and then in chapter 2 presents a sharp social criticism of those who oppress the poor and take their houses and property. In chapter 3 this attack is addressed more directly to rulers who tyrannize their citizens. In 3:5–12, Micah admonishes the prophets for misleading the people concerning the political situation. The style of discourse of chapters 1–3 maintains the characteristic prophetic conception of cause and effect: that the political and military situation reflects social and moral misbehavior. Wars and political disasters do not occur in a vacuum: political events are initiated by God as a punishment; they are God’s response to the moral misconduct of the rulers of Judah.

Micah 4:1–5 describes the new age, the period of peace, while 5:1–5 concentrates on the new ruler of Israel, a descendant of the house of David, who will come from the town of Bethlehem. At 5:9 a prophecy begins concerning the destruction of the state’s symbols of power—the military horses, chariots, and fortresses—as well as the destruction of foreign religious idols. It prophesies a conflict between God and Israel in which God condemns Israel for its betrayal. The speech ends with a moral-religious revelation (6:6–8). The lament of 7:17 is followed by a prophetic liturgy (7:8–20), which concludes with God’s praise and the assurance that God will continue to protect his people as he has done in the past.

Despite numerous textual difficulties, Micah’s message is clear and precise, and he clarifies the role of the prophet:

But as for me, I am filled with power, with the Spirit of the Lord, and with justice and might, to declare to Jacob his transgression and to Israel his sin. (3:8)

Above all, the book lucidly states the meaning of Yahvistic religion in terms of God’s demands upon the worshippers. Micah stresses the elements of justice, love, and kindness as God’s preference in worship (6:6–8).

AN OVERVIEW
MYTHIC THEMES

MICRONESIAN RELIGIONS: AN OVERVIEW

In 1838, the French explorer Dumont D’Urville divided up the Pacific into Polynesia, Melanesia, and Micronesia. Scholars since then have debated whether or not these three terms do justice to the diversity of cultures in these areas, especially in Micronesia, where the first settlers arrived at various times and brought with them different cultures and languages. The Micronesians’ exposure to Western influences also varied. The people of the Marianas, for example, were Christianized by the Spanish by 1700 CE. The Caroline island of Ifalik, on the other hand, became Christian only after World War II.

When the missionary Luther Gulick arrived on the central Pacific island of Pohnpei in 1852 he found the native priests dying out, and their shrines, like the megalithic Nan

Madol, were almost abandoned. Populations were decimated by whaling ships that left behind diseases to which the local people had no immunity; the Caroline island of Kosrae, one of the hardest hit, was left without a population large enough to support elaborate priestly hierarchies and religious title holders. Western governments raced to the islands to claim their shares of the new colonies in the Pacific, and so Micronesia became a patchwork of Spanish, German, British, Japanese, and American trusteeships, protectorates, and colonies. In the twenty-first century all of the Micronesian islands except Guam, a U.S. territory, are independent.

Few of the “little islands” that give Micronesia its name were unified at the time of first contact. Kosrae was the only island with a centralized government under a single paramount leader, and the smaller islands sometimes had several chiefs. The geology of the islands varies greatly. Some, like Pohnpei, one of what are called the high islands, are volcanic with lush vegetation. Others are coral atolls of a few acres only a few feet above sea level. The Marshall Islands, for example, are made up of coral atolls and islands with a total dry land area of 74 square miles spread over 375,000 square miles of ocean. Kosrae, on the other hand, is a single high island of 42 square miles with its highest point, Mount Finkol, at 2,064 feet above sea level.

In spite of the diversity within Micronesia, its cultures and old religions demonstrate certain shared patterns. These patterns can be seen in three areas: the Micronesian conception of the cosmos, the spirit inhabitants of this cosmos, and the patterns of interaction between spirits and humans.

Why these common traits exist when the Micronesian islands were settled by different peoples who spoke different languages and were widely separated from each other isn't entirely clear. Certainly the fact that the Micronesians were and still are some of the Pacific's finest boatbuilders and navigators is part of the explanation; they had the technology to make the Pacific Ocean not an obstacle but a means of colonizing and trading over long distances. Evidence of traffic in precontact Micronesia includes a highly organized trading and exchange system called the *sawei* (basket) that joined the people of Yap and the central Caroline atolls, with the Ulithi islands as the intermediary. Pottery exchanges show that this system began in the seventh century CE.

THE MICRONESIAN COSMOS AND ITS SPIRITS. Their image of the cosmos allowed the Micronesians to explain how things work and why things happen (as is the case with the Polynesians and Melanesians). The cosmos defined the spheres of activity between spirits and humans. Within the cosmos are places for gods, ancestral spirits, and living humans. There are places where people go after death, places where the dead are put to various tests, and places where the living can interact with their deceased kin.

Most Micronesian views of the cosmos are of a sky world as an inverted bowl, with several layers populated by different categories of deities. The islands of Micronesia are

seen as columns projecting up from the bottom of the sea, and the bottom of the sea has a trapdoor that opens not into an underworld but into an undersea world. This is where the people of some islands believe they do when they die.

Early ethnographers recorded descriptions and even collected drawings depicting the cosmos, including a surviving sketch made by a native of Puluwat in 1910. The inverted bowl is the most widespread image, but there are variations. In Pohnpei the vault of the sky was like the roof of a ceremonial meeting house. In the Marshalls there were four heavenly post-men who held up the heavens in each of the four cardinal directions. But as the post-men fell asleep the heavens at each corner collapsed, and then the vault of heaven became an inverted bowl. On the Kiribati atolls the cosmos are depicted as a gigantic clamshell that the god Naurea tried to pry open to let the light come in. He persuaded Riki to help him. Riki succeeded in opening the shell and was rewarded by losing his legs and becoming the eel or snake in the sky: the Milky Way.

Curiously the sun, moon, and stars—all important to navigators—are not of widespread importance in most Micronesian religions, with Kiribati the notable exception. Kiribati is influenced by Polynesian religions, where the sun and moon play prominent roles in myth and ritual. One also finds occasional myths about the sun and moon on Palau, and the constellations Antares and the Pleiades play a role in Marshallese mythology. In the Marshall Islands story, Likitanur, the mother of two brothers, asks the older brother Tumor (Antares) to take her along with him in a canoe race, but he does not want the extra weight. Jebro (Pleiades), the younger son, does take his mother, and as the race begins Likitanur opens a parcel and sets up the first sail and rigging. As Jebro begins to overtake his older brother, Tumor commandeers the sailing boat. But clever Likitanur keeps some of the rigging, and Tumor is unable to change course. Likitanur and Jebro finish the race first and hide in the bushes. Tumor lands and proclaims himself winner and chief. Then Likitanur and Jebro emerge from hiding, and Likitanur proclaims young Jebro the new chief.

This is what is known as a charter myth and is typical of Micronesian mythology. In this case it demonstrates the unwritten law that the rank of chief (*irooj*, *lerooj*, or *iroojlaplap*) is determined by the mother's lineage. This myth has been reinterpreted by contemporary Christians on the remote atoll of Ujelang, who see the rising of Jebro/Pleiades, which comes into view about the time of Christmas, as symbolic of Jesus' birth.

The people of Pohnpei have the same myth, which also has both political and religious meanings. A woman named Likitanir creates the starts. None of her children wants to listen to her, with the exception of the smallest one, Margiregir, who obeys her and takes her in his canoe. She teaches him sailing and proclaims him *nahnmwarki* (a paramount chief, the equivalent of *iroojlaplap* in the Marshalls). Margiregir becomes Margiri on Yap and is a mythic foundation for both

the political and religious centers of Yap. This story, like many others, transcended the boundaries of ocean and language to become one of the common features of Micronesian mythology.

The spirit population. The spirit population of the cosmos exemplifies the Micronesian characteristic of great diversity with certain common features. Many of the islands use the same term to describe the myriad spirits in their cosmos: *énú*, or some cognate of this Chuukic term, which is applied to various kinds of spirits. Across Micronesia, these spirits fall into the following main categories:

- Sky gods, often called the great spirit. An example is the Chuukic Enúúnap. Frequently the sky god's son or brother, the spirit Luk or Nuuk (among other variations), works for the sky god.
- Patron deities. They may live in highest heaven but are still deeply involved in helping humans. They sometimes bring culture and technology, like Liktanur of the Marshalls, who taught humankind the all-important art of sailing.
- Ancestors of the family, the lineage, or the clan. These are the spirits who take possession of their living kin and offer advice, help, and predictions. The Micronesian attitude toward these spirits ranges from what we commonly refer to as ancestor worship to a veneration that is more akin to filial piety.
- Nature spirits (tolls, ogres, and wee people). These spirits are geographically bound to certain locations, like the reef spirits of the Chuuk Main Lagoon.
- Trickster spirits. The trickster is a common mythic symbol throughout Polynesia and Micronesia. He is Olifat (Wonofáát) in the Chuukic islands, Letau in the Marshalls, Nareau in Kiribati, and Maui in Polynesian Hawai'i. In some places he is pure trickster, the archetypal character who does everything wrong, breaks all the rules, and hops into bed with his brother's wife. In others he is cruel, and in many stories he kills one of his brothers. He can also be helpful: on some islands it is the trickster who brings fire to humankind. In general, he functions more as the central figure in a cycle of morality stories illustrating how not to behave than as a supernatural sanction against breaking cultural rules.

A further assortment of divinities does not fit into the above categories. Most cultures have a local deity whose activities overshadow all the others in importance. On the central Carolinian atoll of Ifalik this is Tilitur, who was sent by the high sky god Enúúnap to take care of the people of this atoll. Anthropologists just after World War II recorded the reverence the people of Ifalik showed for Tilitur and his interactions with them. He frequently possessed his chosen vehicles.

Two types of spirits are either rare or completely missing in Micronesia: an omnipotent and uncreated deity and a purely evil deity. The Micronesian pantheon generally lacks

an uncreated creator of all things who existed before the universe and before other gods. Naurea of the Kiribati opens a cosmic clamshell to let light into the world, for example, but that world was already in existence. There is one known exception: ethnologist Wilhelm Müller recorded, and in 1917 published, a Yapese story about an uncreated deity who, merely by thinking, brought into existence the other deities, who in turn created islands, people, plants, and fish (p. 505). However, Dobbin, writing in 1996, found that no contemporary Yapese knew of this god, who was called Gavur li yel yel.

The Micronesian pantheon also lacks a genuinely omnipotent deity and an incarnation of evil like Satan or the devil in Western cosmology, despite the ideas of early Christian missionaries, who identified Enúúnap with the Judeo-Christian God and the trickster figures with Satan. Enúúnap, like Zeus or Jupiter in Greco-Roman mythology, is caught up in the foibles of his children and nagged by his wife. Whatever else he may be, he is not omnipotent. In the category of evil spirits, none is totally evil like the Christian Satan. The tricksters Letau, Nareau, Wonofáát, and Yalifath are a glorious mixture of evil, stupidity, and cleverness, acting at various times as gift givers, killers, and slapstick comics.

Another kind of spirit found only in rare instances occurs when a dead human being returns to possess the body of a living person. William Lessa (1961) traced one of the few examples to an infant boy from Ulithi named Marespa, born in the mid-nineteenth century. The infant's father was possessed by his deceased child, and the spirit of Marespa quickly inspired a cult for healing and curing that spread to other islands, including Yap, Ngulu, and the atolls south of Palau.

Roles in the spirit world. While it is possible to draw a genealogical chart of the spirits for most islands, who begat whom is notoriously inconsistent. The spirits' characteristics vary as well. Olifat (Wonofáát) is a trickster and sometimes a cruel spirit in eastern Micronesia, but on Yap he is Yelafath the Elder (a god who creates the other gods) and Yelafath the Younger (the trickster). This pattern also occurs in Kiribati, where one manifestation of Nareau is a creator and the other is the trickster. In Chuuk tradition, Luk and Lukenleng (or Nuuk and Nuukeynin, literally "middle of heaven") are one and the same god, a god who is something of an heir apparent who does most of the work of Enúúnap. In Yap tradition, however, Lug (Luk) is the god of death who flies about snaring humans in his net, and Lukenlang is a different god.

Patron deities were active in the everyday work of craftspeople, healers, medicine makers, and navigators, and helped assure a bountiful harvest or successful fishing trip. The blending of religion and daily life involved more than just blessing a new canoe or house or praying for the safe return of the fleet. The famed navigators of old learned their craft through training filled with religious ritual. They were initiated into the profession with an elaborate ceremony and performed complex rituals before setting sail. In medicine the

healing chants and formulas for making up medicines ultimately came from the spirits through dreams, possession and trace, or from an elder who passed on these spirit-given gifts.

The creator deities, the sky gods, had different ways of working with the cosmos and human beings. Some of the great sky gods were aloof from the lives of humankind, having finished their creating work and retired to the bliss of one of the high heavens. But in the Chuuk tradition the priest-chiefs (*itang*) invoked the sky gods Enúúnap and Luk as they led their men into battle. The Marshallese creation myth resembles the first chapters of *Genesis*, where God says, "Let there be . . ." and lo, there it is, only in this case the chief Marshallese sky gods send a divinity to earth to teach canoe building, sailing, and tattooing.

Pohnpei mythology offers an interesting contrast. The Pohnpei universe is created by divinities and humans working together. A supernatural octopus directs the first human settlers to the place where the rocks will be deposited to become Pohn-pei, literally "upon a stone altar"). The god Dau Katau confers the first title of Soumenlang on the priest at Salapwuk; this according to oral historian Bernart Luelen is the beginning of religion and the title system on Pohnpei. After the Sau Deleu dynasty was destroyed, the god Luk appeared in a canoe floating in the sky. The current priest-chief, Soukisenlang, and the ruler of Ant Island are brought to the canoe, and they talk with Luk. Together they determine the political structure of Pohnpei: autonomous states (*wehi*) each led by a paramount chief, the *nahnmuwarki*.

The relative importance of each type of spirit varies from island to island, again following the Micronesian pattern of diversity and similarity. In the Chuuk Main Lagoon and nearby atolls the spirits of the ancestors were of primary importance. On nearby Pohnpei the high gods like Dau Katau or Luk were more important.

WHERE SPIRITS AND HUMANS MEET: PLACES. There is no doubt that Micronesians of old believed that the divine met the human at certain physical sites, and the belief in the sacred or taboo nature of some of these sites continues in the early twenty-first century.

Household shrines were common through much of Micronesia. In the eastern Chuuk-speaking islands hanging shrines or altars, often in the shape of miniature double-hulled canoes, provided a place for the spirits of the ancestors to be with their kin. Here offerings of flowers and food were made, and it was at the household shrine that the ancestor spirits could possess a living family member, enabling the possessed one, called the *wáátawa*, to answer questions in the voice of the spirit, predict events and even deaths, and give advice to the living.

Sacred places were often combined with living spaces. The Palauan *kerong* (a possessed and entranced diviner like the *wáátawa* of Chuuk) often conducted their rituals in part of their own house. The raised-rock platforms (*taliuw*) on Yap were both the sacred dwelling sites of the gods and the

residence of priests. On Pohnpei a variety of natural rock formations were considered to be sacred sites where the gods gave the island its physical shape and its culture.

Sacred places were created in other ways. On Kiribati collections of ancestral skulls became a kind of portable shrine that the living talked to in their homes and took to dances in the giant meeting houses, the *maneba*. The cult of the skulls, as Sir Arthur Grimble called it, gave the character of a sacred spot to the place where the skulls were kept.

WHERE SPIRITS AND HUMANS MEET: RITUAL. Micronesians also sought interaction with the spirit inhabitants of the cosmos by means of ritual.

Household rituals. Probably the simplest and most widespread ritual around Micronesia was conducted in the family dwelling or boathouse and dedicated to the remembrance of deceased kin. Rituals were conducted at household shrines throughout Micronesia, even in places with gigantic cult centers like Kosrae's Lelu. On Nauru the household shrine was located at the center pole of the house, where gifts of food were placed for the ancestors (later replaced by Roman Catholic converts with a picture of Jesus). The hanging altar or shrine of the Chuukic-speaking islands, the *faar*, was basically a household shrine for the lineage. Flowers, wreaths, and food could be placed in this hanging altar. In some areas the ritual was even simpler. On Palau the ancestor's betel nut bag (a purse holding the ingredients needed to chew betel nuts) might be hung on the wall of the house and offered a tidbit of food. The Kiribati kept their ancestors' skulls in the house and treated them quite informally, talking with them, offering them cigarettes, and blowing cigarette smoke into the skull.

Divination. Micronesians had a bevy of divination rituals to call on to help them make decisions and forecast the future. The simplest methods were perhaps not religious at all, but, like tarot cards, horoscopes, and palm reading, simply a way of probing into the unknown. Micronesian divination involved analyzing the number and sequence of knots made from fresh young palm fronds. Sometimes the palm knots were replaced by stones thrown on the ground. A Micronesian equivalent of tea-leaf reading analyzed the lines on the inside of a coconut shell. These were forms of do-it-yourself divination, although some people were known to be better at it than others.

Professional diviners worked in a variety of ways. The *kerong* of the Palauans might, for a price, offer to make predictions or answer questions in their own dwellings, from behind a screen, possessed by a spirit but apparently not in a trance. In some cases they had special huts next to their houses reserved for divining. Or they might rapidly chew and spit betel nut in order to stimulate a trance state, during which they spoke as a possessing spirit. Sometimes another person interpreted the words of the entranced diviner.

In some Palauan villages a god or goddess ruled the village, and the leading *kerong* passed along its decisions. At

times these diviners or oracles became threats to the political chiefs. One of the few nativist movements in Micronesia involved a revival of the diviners' arts. In 1915 a *kerong* named Tamadad developed a syncretistic religion that combined elements of the old ecstatic rituals and healing and curing with Christian elements. The religion, known as Modekngel, still exists.

Ecstatic rituals. In Micronesia divination ritual leads logically to ecstatic ritual, which involves trances or altered states of consciousness that are often interpreted as possession. Trances or possession can be found in the past or present culture of almost every atoll or island of Micronesia. The priests at the great cult centers on Pohnpei and Kosrae used trances in divining rituals. The *ibonga* of Kiribati, whom Sabatier variously described as soothsayer, magician, divine, doctor, prophet, miracle worker, and charlatan, used trance. On the atoll of Ifalik, women who fell into trances were often the inspiration for new songs; the same was true of certain people on Yap.

The best-recorded tradition of trance and possession is on the Chuukic-speaking atolls and especially in the Chuuk Main Lagoon. Ancestor spirits were believed to descend onto the shoulders of a living relative and possess them. Those chosen as vessels by the ancestors were called the *wátawa* or *wáánaanú*, literally "the canoe of the spirit." This possession did not happen automatically, however, and there was often speculation at the wake and burial about whether the deceased would be a helping spirit or a harmful one. The hope was that the spirit would descend from the hanging shrine (*faar*) and possess one of the living kin, who would become the *wáánaanú* for the family or lineage and offer valuable advice to the living. Some reports indicate that this tradition is still alive on certain atolls, but by the end of World War II the *wáánaanú* as an official status within the community was rare.

What did continue in Chuuk communities is a more voluntary form of spirit possession and trance, especially among young girls. The signs of an altered state are clearly present in the transformation of the individual's persona. Dobbin has argued that the possession trance is a culturally sanctioned way for young females to protest problems, especially family problems that their cultural status prohibits them from otherwise confronting. If a girl is possessed by her mother or grandmother, the matrilineal Chuuk social system allows the senior woman to berate male family members. Contemporary possession trance is reported in other Micronesian islands, but it is rare. The Chuuk case is a classic example of continuity and change in Micronesian ritual.

Funeral rituals. Funeral rituals vary throughout the islands of Micronesia. The wake and burial rituals on Palau focused on the transfer of the deceased's title (if he or she was a titleholder) and determination of why the person died. The leading women of the group, which might be a clan, extended family, or village, gathered together, and one woman held a bouquet of *sis* branches (*Cordyline fruticosa*). The women

would shout out potential reasons for the death, and if the *sis* bouquet shook, this indicated that the correct cause had been found. Sometimes someone known to be good at this type of divining was invited to the ceremony. Early reports indicated that the woman holding the branches was believed to be possessed by the deceased's spirit, but the evidence is vague. Palauan funerals may still feature trances without possession, as they did in the past.

Burial rituals also vary greatly from island to island. On Yap the dead are considered a source of spiritual pollution, and the immediate kin leave the deceased's house as quickly as possible. They may remain in seclusion and eat a restricted diet for as long as a hundred days. In some areas upper-caste people are buried by landless lower-class people who are beholden to them (this tradition is still observed on Yap). In the past burial was often at sea among the Chuuk, while burial on the family homestead was common on Kosrae. In some places the interment of the body in the ground was temporary, and the bones and skulls were exhumed and given places of honor, often in the home. In some of the matrilineal societies where Christian cemeteries have replaced older burial sites, some of the old ways continue.

The rituals of medicine. Traditional or local medicine is still commonly used in Micronesia, as it is in many parts of the Pacific. How much of it is tied to spirit beliefs and ritual is impossible to gauge. On islands that are overwhelmingly Christian, nobody wants to be known as a pagan, so the use of traditional healing rituals is often disguised. The physical ingredients of a medicine may be used without the traditional chants or with the chants mumbled. Dobbin, however, describes how the mother in a devout Christian family was in the process of becoming a medicine expert and received curing chants in a dream.

The local medicine system may begin with an informal diagnosis of an illness, but there is also a more formal system in which a diagnostic specialist uses divination to determine which spirit power is responsible for an illness. In some cases another specialist will then be called in who has the means to cure the illness. Sometimes these are one and the same person. The curing ceremonies are generally public events that require the presence of family and friends. The location of medicinal plants and details of the recipes, however, may be kept secret.

Occasionally a medicine specialist in Chuuk will receive chants and recipes for medicines while in a trance state, but the more common source of local medicine, as it is called now, is through dreams sent by spirits. One can learn the specifics from an elder or even buy the formula, but ultimately medicine, especially on Chuuk and Pohnpei, comes from the spirits.

Fertility and increase rituals. This category includes rituals designed to help mothers with pregnancy and childbirth and to insure a good harvest and a bountiful catch from the land and sea. On Yap the *tamarong* (priest, magician,

conjurer, or diviner) visited the pregnant woman at distinct periods during pregnancy and offered ritual words or chants (*pig*) to insure the healthy birth of a child. Chuuk had elaborate rituals to ensure the fertility of crops, probably some of the most elaborate among the smaller Micronesian communities.

Breadfruit was the staple starch of the Chuukic world, and the spirits of the breadfruit were believed to live in the mystic south of the cosmos. A breadfruit caller would beckon the spirits to come to the community's breadfruit trees so that the flower would blossom and produce large breadfruits. So important was the caller that his larynx or entire body might be mummified when he died, lest he take the breadfruit spirits with him when he went on to Ewúr, the mystic home of the breadfruit gods and goddesses.

As a breadfruit season approached, the caller began his rounds, blowing on a conch horn and calling the spirits or souls of the trees to come and blossom. Some of these prayers and petitions are still remembered on Puluwat, where the caller was a ritual specialist of high honor. He petitioned, and he begged, and he prayed. He assembled the leading men of the island in a procession. The caller led the way, chanting, and the followers responded as he waved a spear-like rod from side to side. They stopped at each complex of extended family residences, where the caller plunged the rod into the ground and put some of the earth into a basket. He deposited the earth in his own land, and repeated the ritual around the atoll.

The incarnate breadfruit god, a conger eel called the *He-wanu*, appeared on the shores of Puluwat every few years. When one arrived, the breadfruit caller took the eel, wrapped in mats, to a meeting house; only the caller (or priest, as the early reports call him) knew what the sacred eel was saying. The eel's presence sometimes meant that one of the select few who traditionally took care of the eel was going to die, and the ritual became a dirge for the coming death. In other cases the eel was checking up on the Puluwatese, and inquired of the breadfruit caller as to how hard they were working. The eel was put on a special platform bedecked by the women with sweet-smelling wreaths of flowers, and the men brought coconuts as offerings. At first all could come and pay their respects to the breadfruit god, later only men were allowed, and finally only the select few who served the eel god maintained the vigil. Eventually the eel was returned to the sea.

The eel was an important symbol throughout Micronesia. The Kosraean breadfruit goddess, Sinlanka, was symbolized by an eel, and the grand ritual at Pohnpei's Nan Madol included the sacrifice of a turtle to a ravenous moray eel. Myths abound on Pohnpei about the smaller freshwater eels as well.

The grand rituals at Nan Madol and Lelu. Nan Madol at Pohnpei and Lelu at Kosrae were elaborate stone-work constructions that functioned as the residence of the

leading political authorities and groups of hierarchically ranked priests, and also served as ceremonial centers.

Kosrae had a centralized chief or king, the *tokosra*, and several priesthoods, each dedicated to a leading deity such as Sinlanka. Some priests stayed in the ritual and political center of Lelu at Kosrae. Others lived at shrines scattered across the island, and on certain occasions these rural priests led processions into Lelu. One of the most important rituals they led celebrated the coronation of the king and his queen.

Nan Madol was the residence of the leading chief of the Sau Deleur dynasty with a section for the attending priesthoods. Next to the Sau Deleur residence and court was the tiny islet of Idet, where a turtle was sacrificed to a sacred moray eel. To what extent Nan Madol controlled all of Pohnpei is debatable, but other ritual centers with priest-chiefs continued to exist as independent entities.

The turtle-eel ceremony may have been the culmination of a longer, more ancient ritual. Its symbolism is debated. Rufino Mauricio, a Pohnpeian archaeologist and specialist in oral histories, has suggested that the Nan Madol ritual combines an older ritual focused on sacred sites with newer rituals worshipping living animals like the eel. Another interpretation focuses on the meaning of *wehi*, the turtle, which is also the name for the main sections of Pohnpei, and says that three *wehis* sacrificed their independence and autonomy to the ravenous appetite of the Sau Deleur dynasty.

Neither interpretation is compelling, especially since the ritual outlived the fall of the Sau Deleurs and then was stopped by one of the paramount chiefs (*nahnmwarki*) of the Nan Madol area after a priest killed the eels because he did not get his share of the turtle meat. After about 1860 the priesthoods disappeared along with the animal sacrifices. Nan Madol is now abandoned, a monument to the Pohnpeian fear of centralization.

The political structure after the fall of the Sau Deleurs mirrors a shift in the evolution of Pohnpeian religion. One or two priestly centers of worship predate Nan Madol and the Sau Deleur dynasty, with a high priest who also was the political chief of the area. At least one of these the high priests and chiefs, the *soukisenleng* (literally "the master of the part of heaven"), eventually joined the post-Sau Deleur structure of autonomous, paramount chiefs (*nahnmwarkis*) and took or was given the highest title of *nahnmwarki*. His priests took lesser noble titles. The ruler or *nahnmwarki* of the southern *wehi* of Wene is still called the *soukisenleng*, and the other nobles of Wene still have the old priestly titles. Mauricio judges this shift to be an early form of secularization. Of the priesthoods only the titles remain, although it is not known when they lost their religious functions.

Some elements of the old priestly rituals are maintained in the ceremonial houses (*nahs*) of the *nahnmwarkis*. Ritual offerings of *sakau* (kava, *Piper methysticum*) are made to the god as they were in days of old. *Sakau* offering is part of a formal reconciliation ritual led by the chiefs; it is now incor-

porated into the Roman Catholic sacrament of forgiveness. In modern times *sakau*, which is made into a slightly narcotic drink, has been secularized, and can be enjoyed in *sakau* bars.

The dance as sacred ritual. On some islands the dance tradition has all but disappeared. On Guam a so-called ritual fire dance is performed by Filipino entertainers for visiting tourists at the Guam Hilton hotel. Palau is struggling to revive its dance traditions. But in two areas the dance needs no revival: on Kiribati and on Yap. The extent to which Kiribati dance is considered holdy or sacred is uncertain, although the dancers of old were thought to be inspired by the spirits. But on Yap the sacred dance still exists. Sometimes the men or women of a village perform the dance for their village, with no outsiders allowed to attend. Yap is now largely Roman Catholic, and the sacred dance is regularly performed as part of the liturgy. At the adoration of the cross on Good Friday, the women perform the mourning dance and dirge; at the Easter vigil, the hymn of the resurrection, the *Exultat*, is danced. At the ordination of a priest or deacon, the dancing comes after the Roman Catholic ritual. As one Yapese remarked after the Catholic ceremony was finished, “now the real liturgy begins.”

In the late nineteenth century on the Mortlock islands of Chuuk, a strong outbreak of dancing occurred. Protestant missionaries, fearing both its inspiration by the spirits and also what they saw as its obscene forms, thought this a return to the old pagan ways, although the German colonial authorities encouraged it. Different denominations reacted differently to the old ways. On Kosrae and in the Marshalls, where Boston-based Congregationalism became the dominant Christian denomination, the bare-breasted women were required to wear the all-encompassing muumuus. In Yap, the Catholic services are filled with bare-breasted women and men in scanty wraparounds that cover only the genitals.

WHAT HAPPENS AT DEATH. An almost universal Micronesian belief is that the soul and/or the spirit leave the body three or four days after death. On some islands, like the Marshalls, early writers could not find a clear notion of soul among the locals, probably because the Micronesians did not distinguish between soul and spirit, or perhaps because the spirit functioned like the soul of Western traditions. The people of Yap and Chuuk believe in two spirits within a single individual: a good-spirit soul, *ngúnúyééché*, and an evil-spirit soul, *éningngaw*. The good spirit was a spiritual double of the living person and hence could appear to the living. The Chuukese also had a separate word for soul, *gnúni*.

Another almost universal belief in Micronesia is that a departed spirit can be helpful to its living kinfolk. This is the basis for what early writers called ancestor worship, but the term is misleading. Although the deceased might be put in the same general category as the sky deities, for example, in other cases, such as on Chuuk, the good *ngúnúyééché* might become an *éni*, which is the global Micronesian term for gods and goddesses, patron deities, and harmful land or sea spirits. Various islands also had a combination term that

identified the *éni* as a spirit that originated as a human being (*éniúyaramas* in Chuukese).

Widespread ambivalence among the living regarding recently deceased kin is common throughout Micronesia. On the one hand, people hope the deceased will be helpful to his or her relatives, and even take possession of one of the living who will function as the family or lineage medium. On the other hand, they may burn the possessions of the deceased, hoping that the spirit will climb on the column of smoke away from the living and up to the heavens.

Few Micronesian islands seem to have had a version of eschatological judgment, where one's accumulated merit is rewarded or punished at death, although this is debated. Various reports, like Father Cantova's interviews in the 1720s with Chuuk-speaking atoll dwellers who were stranded on Guam or records from the Russian expedition of 1927 speak of an afterlife involving reward and punishment. Spiro's investigations on Ifalik found a highly developed morality, but the sanctions for enforcing the morality came from the chiefs, not the gods or the religious specialists. He saw no evidence of an afterlife of reward and punishment.

The destination of the dead is often determined by a test rather than the record of a good life. Pohnpeians at death came to a swinging bridge over water. If the deceased could not sing well, the swinging bridge dumped the poor singer into the “place of no return.” Yapese could not ascend to the sky layer unless their ears were pierced. On Ulithi a bad person might be destined for a sticky garbage pit. Many traditions include a long journey to the place where the deceased would ultimately live, sometimes on the mystic island of Matang. It was also commonly believed that one went to a part of the cosmos associated with one's occupation, like the deceased breadfruit callers who went to the south part of the heavens where the spirits of the breadfruit came from.

THE PRACTITIONERS OR LEADERS OF THE OLD RELIGIONS.

Religious leaders in Micronesia generally performed a combination of roles, including soothsayer, magician, divine, doctor, prophet, and miracle worker. The biggest problem in describing them is to find an appropriate word for, say, the Palauan *kerong*, the Chuuk breadfruit caller (*sowuyótoomey*), or the Marshallese diviner and magician (*drijikan*). Three of the high islands, Kosrae, Pohnpei, and Yap, had distinct hierarchies of priests. The Kosraean and Pohnpeian priests disappeared in the nineteenth century, and the last practicing Yap priest (*peq'taliuu*) performed his final rituals, unattended by anybody, after World War II. Saipan or Guam had no religious hierarchies, and the Palauan *kerong* generally worked alone. The religious status these leaders hold is given or inherited, not chosen or earned. The spirits have selected these people to receive their spiritual gifts.

Many religious practitioners were part-time functionaries, as is still the case for the Chuuk healers, the *sowusáfey*, and for the Yap masters of the weather, the *tamarong*. Certain practitioners were also craftspeople, experts, and posses-

sors of exotic lore. Classic examples include navigators and the priest-chiefs (*itang*). The navigators had to have technical skills as well as spirit-given knowledge and power to succeed. The priest-chiefs had the technical knowledge to plan wars and also the power of the spirits to lead battles with success. The *itang* were actual combatants poised ahead of their own battle lines. In a sea battle they stood in the lead canoe, blowing the conch horn, waving a spear, leading the men in battle chants and prayers to the war god. When the German colonial powers banned warfare, the *itang* became the respected repositories of traditions, old customs, and lineage histories. Functionally speaking, the *itang* are now the equivalent of the Pohnpeian oral historians, the *soupoadoapoad*. In the twenty-first century about five or six *itang* are reportedly still working in the Chuuk Lagoon. They seem to be confined to the eastern Chuukic islands. The names of some of the *itang* training schools are the same as the navigators' schools in the central Chuuk atolls, where perhaps the navigators were also *itang*. The priest-chiefs found it valuable to know both the skills of the *itang* and of the navigators.

THE UNSOLVED DISTINCTIONS AND TERMS. Many of the neat terminological distinctions made by scholars about the Pacific religions cannot be sustained in Micronesia, including the distinction between magic and religion. When the Ulithian masters of the weather gather near the ocean side of the lagoon and make their pleas and petitions to the gods, is this magic or religion? Some of the chants certainly are petitions and not an attempt to manipulate the powers of the cosmos. Some priests also worked as diviners, and some of the breadfruit callers functioned like priests when they recalled the legends of the breadfruit spirits and petitioned the breadfruit spirits to come and bless the trees with a good harvest.

Every Micronesian culture has words for taboo (forbidden) and sacred (holy). On the islets of the Kwajalein atoll, the places where the chiefs were buried and medicine was made were called sacred, but they could just as easily have been called taboo. And the *taliuw*—the platforms used by the Yap priests of old, which had a shrine for the site's god of goddess on top of the platform—were sacred because of the deity dwelling there, and access was prohibited to anyone but the priests, making them both holy and taboo. Many English translations or glosses for Micronesian words and religious terms are less than perfect fits. Their meanings were frequently distorted by observers who did not understand the theology or cosmology they were reporting.

WAS THERE A SINGLE MICRONESIAN RELIGION? The pre-Christian religions of Micronesia underwent a long period of evolution and change. Pohnpei is the best example of the shift in religion from the cult centers of the priest-chiefs to hierarchical priesthoods at various sites, followed by an attempt at centralization under the Sau Deleurs and new rituals involving the sacrifice of living beings, and ultimately the secularization of priestly titles in the polity of the autonomous states (*wehi*) under paramount chiefs, the *nahn-mwarkis*.

Rituals and religious organizations varied from region to region. Patterns such as the prominent role of divination and the widespread use of trance and possession cut across the diversity in Micronesia, although they are carried out differently in different regions. Certain types of gods are universal: sky and creator divinities, patron gods and goddesses, evil spirits bound to certain locations on land and sea, and of course ancestors. The main categories are the same, but the emphasis given to various gods varies greatly. A test or trial to determine who goes where in the cosmos after death is widespread, and the general lack of eschatological judgment to allot rewards or punishment in the afterlife is a common feature across Micronesia.

Because of the regional differences fostered by geographic distances as well as varying degrees of influence from adjacent culture areas, an overall character cannot be assigned to Micronesian religion. It is a *mélange* of many elements: celestial and terrestrial deities, nature spirits, demons, and ancestral ghosts, with a strong infusion of magic, taboo, and divination. No one trait dominates the system, but many common patterns run through the overarching diversity.

MICRONESIAN RELIGIONS: MYTHIC THEMES

Micronesian myths (as distinguished from folktales) have been primarily the domain of clan elders and sometimes of trained specialists, who cite them in regard not only to community land claims, rights, values, authority, and prestige but also to functions of deities, sequences of rulers, and origins of place-names. On Chuuk, in the Caroline Islands, the specialists (*itang*) narrate myths according to the practice of the school that has trained them; they observe taboos, and they speak a secret jargon consisting of standard words with altered meanings, archaic expressions, and words spoken backward. On Pohnpei, also in the Carolines, the sacred narratives, called “establishing the foundation,” tend to be organized into a cultural and historical developmental sequence about the origins of physical objects and of society and about migrations, wars, and religion; the narratives also include songs that are based on myths. In the Marshall Islands, *rebwebwenato* (storytellers) are the repositories of oral narratives that explain the origins of physical reality as well as the human and spiritual worlds. The Kiribati and Banaba Islanders systematize their sacred narratives so that they begin with creation, continue with traditions about the migrations of clan ancestors from Samoa and about their settlement and experiences in the Kiribati, and usually end with the narrating clan elder’s genealogy.

CREATION AND COSMOGONIC DEITIES. Even within the same archipelago or on the same island, diversity and contradiction characterize the myths about the origins of the world, the pantheon, the islands, living beings, and customs. In the Carolines, for example, the functions of named gods often shift from island to island. However, a persistent Micronesian theme is that a preexistent god or goddess created and generated everything or delegated all or part of the work to newly created subordinates.

According to the Jesuit missionary Diego Luis de Sanvitores, who wrote between 1668 and 1672, the Chamorros of Guam believed that parentless Puntan and his unnamed sister lived before the earth and sky existed. Concerned for the welfare of humankind, which was as yet uncreated, Puntan at his death gave all his powers to his sister, enabling her to fashion the earth and sky from his breast and back, the sun and moon from his eyes, and the rainbow from his eyebrows.

On Chuuk, the Carolinian earth mother is replaced as the primal deity by Enuunap (or Anulap, great spirit). Enuunap either creates the world himself or has Nikowupwuupw (or Ligoupup, bearer or nurturer)—his wife, whom he made from his blood—do it. Their children commit incest and, along with a girl who is born from a boil that afflicts Enuunap, found the clans, for which Nikowupwuupw establishes social rules and to whom she gives healing medicines. Faraulep Islanders state that Solal, a god who was half man and half fish, planted his staff in the primeval sea; it grew mightily, after which his brother Aluelap, who was also half man and half fish, climbed it to sprinkle down earth and so make land. Aluelap now rules the sky while Solal rules the sea and the district under it.

In the Marshall Islands, parentless Lowa is said to have glanced down and murmured until a reef, islands, plants, and a white tern rose from the primeval sea. The tern then created the sky by flying back and forth as if weaving a spiderweb. Lowa’s commands produced deities, each with specific duties. A couple born from a blood tumor on his leg had two children who tattooed nearly every living being. Because the sky rested on people’s heads, two maternal nephews of Iroojrilik (god of the west and of reproduction), netted it and raised it by flying about in the same way as had the tern. His brother, Lomotal, created the seas, lagoons, fish, and seabirds in the same way with his voice.

The myths of the Kiribati show much Polynesian influence; they poetically and metaphorically elaborate the themes of creation from a person’s body, of the planted staff, of divine incest, and of sky raising. They may indeed have a broader base in ancient Austronesian culture. Their primordial deity, Na Areau (Na Areao or Nareau), may be not only the creator but also a world transformer, shape-shifter, and trickster, or there may be two Na Areaus, an elder who creates the world and a younger who puts the world in order. Although Na Areau’s name means “Sir Spider,” the Kiribati rarely think of him as such. Na Areau brooded alone on the rock-hard carapace of the undifferentiated universe, called “the darkness and the cleaving together.” With his potent staff he penetrated its hollow interior, where, some say, the last child of Rock and Nothingness (who were the offspring of Sand and Water) was Na Areau the Younger. The elder Na Areau then vanished to leave the work to the younger, who, after naming and activating the preexistent, recumbent Fools and Deaf Mutes, had them free and raise the carapace of the universe, which became the sky.

In one version, Na Areau the Younger took the eyes of the elder Na Areau to form the sun and the moon, his brains to make the stars, and his spine for the Ancestral Tree on Samoa, a land that Octopus and Wave had formed. Humanlike and nonhumanlike deities, male and female, grew happily on and under the tree, each in his or her place, until Red-tailed Tropic Bird, who lived at the crest of the tree, defecated on those below. Na Areau then burned the tree, forcing the ancestors to seek new homes in the Kiribati, which had been created by Na Areau's commands (or other means). Red-tailed Tropic Bird then settled in Makin, where it ate people until the ever-benevolent Titua-bine, whose pet it was, ordered it killed. Red-skinned men grew on what had been its pandanus perch, and women grew on the coconut tree that had been planted by the goddess on her pet's grave. These newcomers (both male and female) became chiefs in the local assembly house. Other Kiribati also have local ancestral trees that have sprung from an ancestor's grave.

Some Kiribati replace Na Areau in his role as the transformer with Auriaria, son of Tituabine and Tabakea (hawk-bill turtle), who are sister and brother born as a result of Earth and Sky rubbing together. According to this alternative version, Na Areau sprang from Tabakea's head. When Auriaria, having directed the separation of Earth and Sky, struck Heaven with the staff given him by Tabakea, the islands on top of Heaven tumbled upside down into the sea with Tabakea under Ocean Island. Then Auriaria planted his staff on Samoa, which he had raised from the sea, so that the staff could grow into the Ancestral Tree. Later he married Na Areau's daughter, whose descendants now live in the Kiribati.

The high god who had been described in most detail, Enuunap of the Chuuk area, lives in a mansion, one part for himself, the other for his ten siblings. Flounder, who has both eyes on the same side, guards Enuunap; while Sandpiper, on the clashing rocks at Enuunap's door, shrieks as souls of the dead try to enter, allowing only the worthy to pass safely between the rocks. The now aged, white-haired, long-breasted, weak, and virtually inactive god has two men to raise his eyelids so that he can see; they also open his mouth and raise his upper lip so that he can eat. Like Puntan, Enuunap does not receive worship. Nonetheless, he is omniscient, the creator, the ruler of the pantheon, and with his brother Semenkeooror (Father of Determining), he is the god of wisdom, the greatest *itang*. Among the high gods there are others of similar inactivity.

The Ifaluk high god Aluelap's only activity is to advise his son Lugeilang (middle of heaven), who raises Aluelap's eyelids to get his attention. Yet there are also high gods who actively help people. Yalafath of Yap, a most helpful deity, had Dessra, the thunder god, bring people fire; Yalafath also sent his wife as a frigate bird to scout a flooded island's needs, and once, after resuscitating a dead boy, he gave the boy and his mother sand to form islands and seedlings to plant.

HUMAN ANCESTORS. Except in those Micronesian mythic traditions in which the primal deity and his or her spouse have children, it is usually unclear how the first people originated. Rather, attention is paid to particular individual mythic figures, male or female, and the role of the opposite sex is often denied. Husbandless females, human or animal, bear human beings and animals and so establish clans. Children also emerge from parts of the body or from maggots on the body of a deity who is more often male than female. Even trees bear people, as in the Kiribati, and in some traditions a tree growing from a person's head splits open to release children. In one story the earthly parentage of a clan's female ancestor is denied when she, a fingertip-size baby, falls from heaven.

A female animal ancestor often becomes her clan's totem. In one of several variations on the "swan maiden" theme, a Yap man, by hiding the fins of a dolphin girl who came ashore to dance, captures and marries her. Years later, on finding her fins, she leaves her human family to return to the sea, and her daughters establish the Dolphin totemic clan. Occasionally a totem animal is helpful, as in the Pohnpei story in which stingrays blanket the sea, tossing a disrespectful minor chief from one to another until they finally kill him for sending their totem descendant, the king, a pregnant woman's corpse instead of the bananas he had requested.

Many traditions include the tale of an animal mother's beautiful daughter who marries a king who has never seen his mother-in-law. For example, in one version Good Lizard makes channels on Pohnpei Island as she crawls to visit her daughter, who was married to the king, holder of the dynastic title Sau Deleur (Lord of Deleur). When the husband brings his mother-in-law her food, she tells him not to look at her. He disobeys, panics, and sets fire to the enormous guesthouse he had prepared for his wife's mother. His wife runs into the flames; he, for love of her, follows, and the three perish.

There are numerous myths about marriages between sky gods and mortal women. Olofat, the Caroline Islands trickster, is the son of Lugeilang and an earthly woman, from whose head he emerges. Like many culture heroes, he grows precociously. Later he flies to his sky father on a column of smoke. A Kiribati semidivine clan ancestor, Bue (burn), snares his father the Sun to demand knowledge and magic; Bue is not, like the Polynesian Maui who performed a similar feat, trying to regulate the sun's speed.

On both Pohnpei and Kosrae it is said that Isokelekel (Ijokelekel, shining noble or wonderful king) is the son of the Pohnpei thunder god Nansapwe (Nan Djapue) and the latter's aged clan sister from Katau (which may be Kosrae or a spiritual place to the east). The tart lime given to her by Nansapwe makes her pregnant, and in her womb Isokelekel learns that he is to take revenge on the irreverent Sau Deleur, the ruler who had once imprisoned Nansapwe for seducing his wife. When he is a young adult, Isokelekel sails against

this Sau Deleur with 333 warriors and their families. Isokelekel defeats his enemy, seizes power, and puts an end to a long line of increasingly oppressive rulers who had set their subjects impossible tasks. For instance, a certain Sau Deleur had demanded a rare shell; a boy, aided by fish, went under the sea to get the shell, but on his return he and his family committed suicide to escape having to perform any further such tasks.

TRICKSTERS AND DEATH. Cycles of myths tell of divine and semidivine tricksters who are magicians, shape-shifters, transformers, and gross adulterers. When the demigod Olofat (Chuuk Wonofaat Stamper), who is known throughout the Carolines, was insulted by boys in the sky world, he gave their pet sharks teeth and their stingrays barbs such as they have now. Pretending ignorance of his relationship to him, Olofat jealously kills his half brother. When Half-Beak kills Olofat for stealing his wife, Lugeilang resuscitates him. Na Areau also enrages gods and men. When carpenters jam a house post down on him, Na Areau, like Olofat in a similar story, has a side passage ready. With red earth and coconut he simulates blood and flesh and deceives his enemies into thinking he is dead; then he appears and mocks them.

In the myths of the Marshall Islands, Etao and Jemaluut are either the sons of Iroojrilik and Lijebake (Libage Lady Turtle) or spring from the thunder god Wullep's head. Etao constantly outwits his elder brother and others, and like Na Areau he plays the oven trick. Telling his host of an easy way to get food, he lies down in a hot earth oven, is covered over, and later strolls up from the beach to uncover an oven full of fish and taro. His foolish host, imitating him, perishes, and the trickster takes his wife. This is an Austronesian-wide mythic theme found, for example, among the people of New Hanover in Papua New Guinea.

In these Micronesian myths there is little interest in the origin of permanent death. Olofat decrees that all must die and stay dead, and his sister adds that Olofat too, but not the gods, must die when the world ends. Forgetfulness leads to permanent death when children forget to dig up their mother's corpse as directed or when those who, having learned a man's god-given secret of eternal life, forget a part of the secret and fail to revive him. Stories of temporary death and resuscitation are frequent. When the Belauan semidivine Milad dies in a flood, the gods whom she had once sheltered restore her to life and send Mud Hen, a personified mythic bird (progenitor of *Rallus pectoralis*), to fetch the "water of immortality" in a leaf. However, selfish Mud Hen has a hibiscus bush pierce the leaf. While the spilled "water" makes the hibiscus immune to harsh conditions, Milad loses the chance of immortality. The angry gods, striking Mud Hen's head, give it a red stripe to make it a symbol of wickedness and ugliness. All mud hens now have that stripe.

THE LAND AND ITS FRUITS. According to the myths of the area, numerous islands and islets developed not only from sand but also from taro, flowers, branches, and the like that

were cast on the sea, often by disgruntled women leaving home. Dead bodies could also be the bases of islands. Belau developed from a giant's corpse and the people of Belau from its maggots; Lelu developed from a whale-mother's corpse. Except on Fais and Mile, island fishing is less important in the myths of Micronesia than in those of Polynesia. When Motikitik (a cognate of Mautikitiki, or Maui) fishes up Fais, his dead mother's signal confirms that he, not his brothers, owns it and can divide it into its present three parts. Because it acquired the magical hook, a Yap district dominates Fais politically; were the hook lost, Fais would sink. Etao capsized Mile to test some diviners' skill in coconut-leaf divination; they located the island, fished it up, and made a drain hole that is now a taro pit. Stories of building an island, usually with rocks flying magically into place, are common. Aided by an octopus, explorers found an exposed reef on which to build Pohnpei and shelter it with mangroves and a barrier reef. Later Olsihpa and Olsohpa constructed eighty or ninety artificial islets, Nan Madol, as sites for a ceremonial center, now in ruins. Olsohpa was perhaps the first to bear the royal title Sau Deleur. According to some folk beliefs, bands of "little people," also known in other islands, did the actual work of construction. In most accounts the work is communal, and the heaviest labor is accomplished by magic and a couple of large, strong people.

The principal cultivated plants or certain varieties of these came directly or indirectly from celestial beings, usually women. Even modern Micronesian gardeners think any new variety of plant has fallen from heaven. When three swamp taros (*Cyrtosperma*) fell into the sea from the Kiribati sky, they became porpoises, swam to Arorae, turned back into taros, and were planted by a man whom Tituabine instructed. Two sky men gave taro to Majro Atoll after Namu had rejected it. Milad taught the people of Belau to cultivate *Colocasia* taro; each island learned differently.

More than one mythical woman who bore both human beings and food plants had a coconut son. Limkade, Iroojrilik's sister, planted her coconut son Tobolaar after he told her of benefits that would grow from him and therefore prove his value to his hostile, older, human brother. Like other Pacific Islanders, Micronesians tell of coconut trees growing from the head or the grave of an eel or a person. Ninkowupwuupw saw her first child's eyes and mouth in the nuts from the coconut tree growing on his grave. When a female eel, which Yalafath sent to Yap to populate the island with people, was killed generations later, a coconut tree grew from her buried head, a banana plant from her middle, and a swamp taro from her tail.

On Pohnpei, kava grew from a bit of the god Luhk's flesh that he gave a kind woman to plant, and sugarcane grew on the grave of a man he had ordered buried. Observing that rats stupefied themselves on kava and then chewed sugarcane as a chaser, people imitated them, as did the sky dwellers.

According to the myths, easy ways to get food eventually fail through envy or carelessness. Jealous neighbors who

chopped down Milad's god-given tree, which produced breadfruit and fish, thereby caused a life-destroying flood; carved wooden storyboards from Belau portray the scene. Travelers bring home new foods or carry them elsewhere. Yalafath, on sending his guest Galuai flying home on a chicken-festooned pole, said that if he took proper care of the chickens they would excrete yams. Soon Galuai became careless, and the hungry chickens, by eating the yams, lost their magic (as in another tale did another man's mistreated money-excreting bird). Travelers, including gods, who eat from an inexhaustible taro plant, coconut tree, or fishpond in an alien land or from a tree growing in midocean must watch out for supernatural hazards.

ORIGIN OF FIRE AND TECHNOLOGY. People ate only sun-baked food until male spirits, usually from the sky and consigned to earth against their will, rewarded helpful women or boys with the knowledge of fire and cooking. Etao taught a generous boy; a disoriented spirit (only a head) instructed a Mortlock boy who escorted him home (and also restored the life of the boy's brother). When a Yap woman extricated the thunder god from a prickly pandanus, he put two sticks under his arm to imbue them with fire and then demonstrated how to make fire with them and cook; he also taught her pottery making. Fire from a god's body is a recurrent motif in Austronesian mythology. On Chuuk, Rat, a personified mythic being, taught a sympathetic woman to make fire and cook after Nuukeyinen (Lugeilang) had set Rat's muzzle on fire and driven him from heaven for thievery. On Mortlock and Namoluk, Olofat, after escaping from being burned alive for his tricks, became the god of fire and the condemned and sent fire to earth in a starling's beak.

In the myths of the Kiribati, fire came from the ocean. Because the sunbeam that was caught by the boy Te-ika (the fish) set numerous fires in the ocean world, his father Bakoa (shark), Lord of the Ocean, exiled him. On earth, Tabakea, Lord of the Land, beat Te-ika and his sunbeam to death with sticks that absorbed the fire. Subsequently he revived Te-ika with the same sticks because of Bakoa's grief, but the fiery boy died at the water's edge. Like Maui in Polynesia, Na Areau in the Kiribati repeatedly demanded fire from its keeper (here, Lightning); but unlike Maui, Na Areau did not want to learn the secret of making fire. He wished only to provoke the thunder god Tabuariki to a wrestling match and to weaken him by breaking his arm.

Spirits keep secret their fishing techniques, gear, and magic except from generous and deserving individuals. A woman to whom a sea spirit has divulged family secrets in exchange for her new yellow skirt has to flee from the sea spirit's angry father to another island where, however, she sells her secrets. In exchange for secretly borrowing his canoe, spirits later show a Ulithi man how to make fish traps. According to a complex myth, the people of Chuuk did not know how to fish until the god Solal taught a neglected one-legged boy, whose success then led villagers to make him chief.

Because of the enormous hazards of seafaring, experts in the practice, lore, and magic of canoe building and navigation are highly prized by the islanders. Experts from the Marshall Islands fear that they may at sea forget their mnemonic, informational, magical, and courage-inspiring chants; others fear watchful Jemeluut (Rainbow), who might punish them for mistakes at sea. In Ulithi, when Palulop (great navigator), a sky man residing on earth, teaches his sons navigation, the as yet unborn Ialuluwe (Aluluei) listens. As elsewhere in the Caroline Islands, he subsequently became the supreme sea god. Like the Polynesian Tinirau, he has two faces, one looking ahead and the other looking back at dangers people cannot see. Of his sons, Rongerik studies diligently under his father, as a future navigator should, and later has to rescue his brother Rongolap, who had thought only of women and had neglected his studies.

Three women who transmitted navigational lore to people are the Yap goddess Legerem, who taught canoe building, navigation, and star lore; the Kiribati ancestress Branch of Buka, whose grandfather taught navigation and bonito fishing to her rather than to her selfish brothers; and in the Carolines, Aluluei's daughter, who, having given three navigation gods an inexhaustible drinking nut, received from them knowledge that was as yet unknown to her father.

Certain mythical canoes made of rock, sand, taro tubers, or pandanus drupes obey verbal commands even if the owner is not aboard. Others skim through the air, reflecting Micronesian interest in flying by magic over their vast island area; in one myth a man's hollow wooden bird carries him to his abducted wife. More pragmatically two Pikinni (Bikini) men are said to have invented the Tridacna adze and the paddling canoe. Subsequently the Marshall Islanders learned about Loktanur's invention of masts and sails, with which she had enabled Jebro, youngest of her five sons, to win a race to become chief. Like other Pacific Islanders, a canoe maker may find his or her felled tree restored by an offended spirit. When this happened to Rongerik, Aluluei told him to first greet a trilling bird named Seilangi, god of carpenters. This done, happy Seilangi made Rongerik's canoe in one night to start him on his great career as a navigator.

POLITICS AND POWER. Throughout Micronesia knowledge is power. Those who possess the narratives hide things, change things, and selectively reveal things that will give a certain shape to political and social reality. While myths seem to speak of the past, certain themes, such as the resistance to hegemony found in trickster stories, address the present and offers hope for the future. On Pohnpei, Isokelekel's victory over the increasingly despotic Sau Deleur becomes a motif for resistance to the regionalizing tendencies of the Federated States of Micronesia. In the Marshall Islands, Etao does prevail against the more powerful gods and thus becomes a symbol of hope in the struggle of the people of Pikinni, Anewetak, and Epja against the American military weapons program.

BIBLIOGRAPHY

The following publications are organized according to three eras of collection of mythological materials.

First Era

The Belief among the Micronesians, the third volume of James G. Frazer's *The Belief in Immortality and the Worship of the Dead* (London, 1913–1924), gives English translations from the first era of Spanish and German collections of myths, tales, and legends that, despite Frazer's title, relate to more than simply death and immortality. These collections date up to and include 1914. The volume also contains many examples from Wilhelm Müller's *Yap* (Hamburg, 1917–1918), which is contained in *Ergebnisse der Südsee-expedition, 1908–1910* (ESSE), edited by Georg Thilenius, a work that is conventionally identified as ESSE II. B. II.1–2. Frazer's *Myths of the Origin of Fire* (London, 1930) includes Micronesian examples from English sources, such as Frederick William Christian, *The Caroline Islands* (London, 1899; reprint, London, 1967), and English translations of Spanish and German sources, including examples from several ESSE volumes.

As almost every ESSE volume includes myths (some are devoted entirely to narratives and chants), the series is an indispensable primary source. Also during the first era, the series Anthropos Bibliothek published August Erdland, *Die Marshall-Insulaner* (Münster, Germany, 1914), and Laurentius Bollig, *Die Bewohner der Truk-inseln* (Münster, Germany, 1927), both of which take into account the islanders' own classification of genres. Paul Hambruch, *Südseemärchen aus Australien, Neu-Guinea, Fidji, Karolinen, Samoa, Tonga, Hawaii, Neu-Seeland* (Jena, Germany, 1921), has valuable notes on the distribution of certain myths.

Second Era

As the first era was that of Spanish, and then German, political control of the Marianas, Carolines, and Marshalls (the Gilberts remained British), the second era of collection was that of the Japanese between the two world wars. Lack of translation from the Japanese has made largely inaccessible such publications as those by Masamichi Miyatake and Masaachi Noguchi for Palau (now Belau) and especially Hisataka Hijakata for Palau and Satawal. Until Hijakata taught Palauans to carve portable storyboards, they had carved mythic scenes only on men's clubhouses.

Third Era

The third collecting era in the three archipelagoes began after World War II with the Coordinated Investigation of Micronesian Anthropology (CIMA) and led many Americans to do fieldwork in the area. A work of special note is Edwin Grant Burrows's *Flower in My Ear: Arts and Ethos of Ifaluk Atoll* (Seattle, Wash., 1963), which discusses myths and chants in terms of style and social values. Roger E. Mitchell, *Micronesian Folktales* (Nagoya, Japan, 1973), includes notes on distribution. Seventeen pages of annotated listings of Micronesian, including Kiribati, mythology are in Margaret Orbell, *A Select Bibliography of the Oral Tradition of Oceania* (Paris, 1974).

Collections by Micronesians themselves are increasing. Particularly remarkable is John L. Fischer, Saul H. Riesenberg, and Marjorie G. Whiting, eds. and trans., *The Book of Luelen: Luelen Bernart* (Honolulu, 1977). Luelen (1866–1946?), a

Ponapean man, wrote and dictated between 1934 and 1946 what he considered significant for his family to know about Pohnpei, including its myths, oral history, and song texts. John L. Fischer, Saul H. Riesenberg, and Marjorie G. Whiting, eds. and trans., *Annotations to the Book of Luelen* (Honolulu, 1977), adds explanations, variants, and comparative data.

Yale University's Human Relations Area Files (HRAF) has produced English translations of parts of the German ESSE and other works. An example is the complete translation into English of the German work by Augustin Krämer and Hans Nevermann, *Ralik-Ratak (Marshall-Inseln)* (ESSE II. B. XI; Hamburg, 1938), as HRAF no. 1003. Most Micronesian school readers retell the traditions, but Pensile Lawrence et al., eds., *Pohnpei ni Mwehin Kawa: Old Po-nape* (Saipan, 1973), uses Paul Hambruch's *Ponape* (ESSE II. B. VII.3; Hamburg, 1936), quoting his Ponapean texts and translating into English Hambruch's free German translations.

There have been significant attempts to collect, preserve, and use Micronesian myths. Students have become more aware of their heritage, as evidenced in Gene Ashby, comp. and ed., *Never and Always: Micronesian Stories of the Origins of Islands, Landmarks, and Customs*, 2d ed. (Eugene, Oreg., 1983). Museums and libraries have begun to collect local myths, for example, the Alele Museum on Majro, the Belau National Museum, the libraries at Belau Community College and the Community College of Micronesia, and the Oceania and Special Collections at Northern Marianas College. These and other sources contributed to Bo Flood, comp., *Marianas Island Legends: Myth and Magic* (Honolulu, 2001), and Bo Flood, Beret E. Strong, and William Flood, comps., *Micronesian Legends* (Honolulu, 2002).

Anthropologists continue to develop an understanding of Micronesian myths. Glenn Petersen explores the meanings and political uses of narratives in *Lost in the Weeds: Theme and Variation in Pohnpei Political Mythology*, Occasional Paper 35 (Honolulu, 1990). Ward H. Goodenough analyzes the relationship between myth and personhood in *Under Heaven's Brow: Pre-Christian Religious Tradition in Chuuk* (Philadelphia, 2002). A notable collection of myths is Jack A. Tobin's *Stories from the Marshall Islands: Bwebwenato jan Aelon Kein* (Honolulu, 2002). Tobin provides texts collected over the last forty years in both Marshallese original and English translations.

There have been some creative attempts to bring myths to bear on present realities. Robert Barclay probes the neocolonial arrangement on Kwajalein through parallel story lines juxtaposing life in the expatriate American community, life in the Marshallese labor community, and life in the spiritual world of Etao and Jemaluut in *Melal: A Novel of the Pacific* (Honolulu, 2002).

KATHARINE LUOMALA (1987)
MICHAEL A. RYNKIEWICH (2005)

MIDRASH AND AGGADAH [FIRST EDITION]. Regardless of what specifically the Hebrew word *midrash* stands for in its two occurrences in a postexilic book of the Hebrew scriptures (2 Chr. 13:22, 24:27), where the

reference is clearly to something written or written in (Heb., *ketuvim*; Gr., *gegrammēnoi*), by the last century BCE it stands for oral interpretation, that is, interpretation of the Torah, the Law of Moses; and one who interprets the Law is referred to as *doresh ha-torah*. This we learn from the literature of the Dead Sea sectarians (*Damascus Covenant* 6.7, 7.18f., 8.29; *Manual of Discipline* 6.6, 8.15; see also *Ecclesiastes* 1:13). Indeed, it is possible that already at the beginning of the second century BCE there were in existence schools where Torah interpretation was going on. In the Hebrew of *Ben Sira* (c. 200–180 BCE), the author, Simeon ben Joshua ben Sira, or Sirach, by whose time “wisdom” is already equated with the Torah, speaks as follows: “Turn to me, you who are untaught, and lodge in my school [*beit midrash*; literally, ‘house, or place, of *midrash*’; *en oikō paideias*].” *Midrash* is therefore a school activity. In the *beit ha-midrash*, the school, learning is to be found, wisdom is to be acquired, there is a master, and there are disciples; through interpretation, understanding of the Torah is attained: “The book of the covenant of the Most High God, the Law (Torah) which Moses commanded us . . . fills men with wisdom, like the Pishon, and like the Tigris at the time of the first fruits. It makes them full of understanding like the Euphrates, and like the Jordan at harvest time” (*Sir.* 24:23–26)—and there is more to this effect.

ORIGINS OF THE MIDRASH. A question that may never be answered satisfactorily is that of when, precisely, the interpretation of the Torah began. For from the moment any text is adopted as a rule or guide of life, some interpretation—added explanation, commentary—inevitably becomes necessary. In scripture itself, though most commandments are lucidly drawn up, there are four occasions when even Moses was in need of further instruction regarding procedures for laws already established (*Lv.* 24:10–23; *Nm.* 9:4–14, 15:32–36, 27:1–11). The *Midrash* also calls attention to Moses facing difficulty in understanding specifically what God has ordered (*Mekhilta*, ed. Jacob Lauterbach, 1.15; cf. *Sifrei Zuta*, ed. Saul Lieberman, 6.16; but see also Harry Fox in *Tarbiz* 49, 1980, 278ff.). In scripture such cases are reported probably to underscore that no human legislator, not even Moses, is the originator of biblical laws, that Moses only transmits what the Lord ordains; the Law of Moses is God’s law which he communicates through Moses. But these cases at the same time illustrate that no written code can be operative without supplementary instruction. And supplementary instruction is what *midrash* provides.

There is therefore a measure of justice to the traditional view that the written Torah had to be accompanied from the outset by expository teachings of some kind, transmitted and inherited orally (the oral Torah). But we are in no position to fix the time when precisely such very ancient supplementary teaching began. In legendary lore there are views that, for example, statutory prayer services were first established by the patriarchs (B.T., *Ber.* 26b); that benedictions of the grace after meals were added by Moses, Joshua, David, and Solomon (*ibid.*, 48b); and that already at Sinai at the giving

of the Ten Commandments interpretation was taking place (*Mekhilta* 2.267). But such statements have no historical value and perhaps are not meant to be taken as history in the strict sense. They represent a tendency to project later institutions farther and farther back in time in order to suggest high antiquity and that these are not recent unauthorized inventions.

Whatever very ancient interpretation may have been like (reflected also in glosses, popular etymologies, and parables within the Hebrew scriptures themselves; cf. I. L. Seeligmann in *Supplement to Vetus Testamentum*, vol. 1, 1953, pp. 150–181), it is unquestionable that from roughly 250 BCE, when the Pentateuch was translated into Greek (as the Septuagint), and continuing for seven hundred years and beyond, when major collections of midrashic literature continued to be redacted, *midrash* flourished in the Jewish academies of Palestine. From the end of approximately the second century CE, *midrash* flourished to a lesser extent in the Babylonian Jewish academies as well, though it was principally a Palestinian creation.

Hellenistic-Roman influence on intellectual and cultural life in Jewish Palestine affected midrashic activity, as can be seen in the penetration of Greek (and other foreign) terms, the terminology for some rules of interpretation, the circulation of tales and epigrams, the parables drawn from royal and imperial establishments, a few cultic details, and the significance given to the numerical value of Hebrew words (*gimatriyyah*). In short, while it would be inexcusably uncritical to assume that wherever there is influence there is simultaneously direct dependence and borrowing, the rich and constant intellectual preoccupation with explanation of the language and content of scripture by teachers to students in the schools, and to the public at large by means of sermons in the synagogues, is an echo of the stimulation provided wherever—not only in Palestine—the spirit of Greek learning and letters came to the attention of the learned classes. Native traditions were not necessarily abandoned; indeed, they might now be held onto more tightly, but they would also be interpreted in ways comprehensible to those who lived in an age when Greek models of thinking and expression dominated the overall intellectual climate.

AGGADIC MIDRASH. *Midrash* (i.e., interpretation, commentary, exegesis, amplification) was applied to all of scripture, and in tannaitic times (approximately the first two centuries CE), especially to four books of the Pentateuch, *Exodus* through *Deuteronomy*, because these contained the bulk of biblical *halakhah*, the regulations governing the conduct of society as well as individual practice. However, even in these books there is considerable nonhalakhic material, what is called *aggadah*, and the first book of the Pentateuch, *Genesis*, is almost entirely *aggadah*. Aggadic subject matter was therefore also commented on in the tannaitic *midrashim*, and some of the leading masters of *halakhah* were also leading masters of *aggadah*. Thus we have aggadic *midrashim* not only on *Genesis* but also in the midrashic compilations on

the other Pentateuch books as well, and aggadic discussion is thus included not only in the tannaitic *midrashim* but in subsequent works devoted to all the books of the Hebrew Bible.

The word *aggadah* may be rendered as “narrative, recitation, account based on scripture,” but the term, the concept, implies and refers to very much more in the midrashic and Talmudic corpora. By *aggadah* is meant that which strictly speaking is not classified as *halakhah*, as required, normative practice. *Aggadah* includes narratives, historical composition, poetry, speculation, genealogical records, fanciful interpretation, moral exhortation—in short, the exposition of the whole variety of scriptural contents beyond the codified, legislative, and juristic, prescribed courses of action which constitute *halakhah*.

There are instances where a sharp line between aggadic comment and halakhic cannot be drawn easily; see, for example, *Keritot* 6.3 (and cf. Eli‘ezer in *Keritot* 6.1). On the whole, however, a halakhic discussion is easily distinguished from an aggadic one. In the former, legalistic concern is uppermost, norms of practice are sought, there is close attachment to what the sages regard as literal meaning, argument by authorities is erudite and acute, there is constant resort to tradition, rules of interpretation are followed with due regard for their function (those of Hillel in the first century, those of ‘Aqiva’ and Yishma‘el in the second century), and casuistry is employed as in all legal and scholastic disciplines. On the other hand, *aggadah* is unrestrained contemplation and interpretation associated with the vocabulary and themes of all parts of the Bible. There is free application of the subject of one verse in scripture to another verse far removed from it, so that, for example, in undertaking to comment on *Leviticus* 1:1, the teacher or preacher introduces *Psalms* 103:20 and by skillful adaptation can demonstrate that the *Psalms* verse explains the intention of the *Leviticus* verse. *Aggadah* is very often sermonic, interpretation for the benefit of the folk in the synagogue, and therefore, though there are, so to speak, rules of interpretation for *aggadah* as well, they do not really confine the *aggadot* within strictly drawn hermeneutical perimeters.

Considerable liberty of interpretation was permitted to and practiced by the authors of *midrash aggadah*, who employed all the rhetorical devices common among textual scholars of their time, used, for instance, in the interpretation of Homer. Thus much is made of punning, of homophones, of methods of dream interpretation, of figures of speech, and of acronyms. A frequent form of interpretation is the parable of kings and their subjects. Verses receive not just one but many interpretations, which indictes not the rejection of previous explanation but the simultaneous legitimacy of a number of meanings which the biblical, divinely revealed text contains and hence, also, beneath-the-surface lessons. *Midrash aggadah* is employed for polemic purposes, against internal challengers as well as antagonists from the outside. For example, when Pappos interprets *Job* 23:13 as a state-

ment of God’s omnipotent and arbitrary power, ‘Aqiva’ hushes him up by means of an alternative interpretation that every decision of God is just, (*Mekhilta’* 1.248). Or when Israel is mocked because the Temple was destroyed (presumably, a sign of God’s rejection of Israel), one sage declares that this was, on the contrary, a sign of God’s love for Israel, in that he let out his wrath on the sticks and stones of the structure (his own habitation) rather than on the people themselves (*Lam. Rab. on Lam.* 4:11 ed. Buber, 74b). Comments like these were obviously made as a consolation after profound tragedy. And they reveal too the ready resort to paradox: even misfortune may be for the good (see also *Genesis* 45:5–8; for paradox in *halakhah*, see *Tanhuma’* on *Numbers*, ed. Buber, 52a–b).

Along with polemics, *midrash aggadah* does not hesitate to indulge in varieties of apologetics. Thus examples of questionable behavior of the patriarchs and Israel’s heroes (the twelve sons of Jacob, David, and Solomon) are frequently excused and presented in a positive light, while their enemies’ characters are in almost all respects regarded as wicked—typical folkloristic treatment. Events in scripture are identified as foreshadowings of experiences later in the sages’ own times and of the age to come. By means of *midrash* the protests and resentments of later generations find eloquent outlet, and this in turn leads to attempts at theodicy. In the retelling of biblical narratives legendary lore is drawn upon in order to emphasize particular values and ideals; so, too, to contrast the ways of the nations of the world with Israel’s ways. And in virtually all interpretation, especially where more than immediate, literal meaning is sought, the aim of aggadic *midrash* is moral and didactic. This is particularly noteworthy in the stories told about famous sages: in these, fancy and fact are so closely intertwined it is rare that the one can be separated from the other.

Aggadic *midrash* also preserves evidence of Gnostic speculation by certain rabbis on the theme of creation, on the chariot spoken of by Ezekiel, on the overpowering reality of the godhead and his celestial retinue, on major historic experiences of Israel (at the sea after the redemption from Egyptian bondage and at the Sinai revelation), on the contrast between the fate of man after the Fall and before it and what might have been otherwise.

With such latitude available to aggadic *midrash*, all aspects of life come under review—the relations of man to God and of man to fellow man. Piety of conduct (in the light of the law and in action surpassing legal prescription) and piety of thought are exemplified. Public virtue and private virtue are discussed in the light of moral expectation, related to biblical verses, which are quoted and given novel interpretation, and interrelated with the particular theme in the mind of the teacher or preacher.

For example, scripture (*Ex.* 19:1–2) reports that “On the third new moon after the Israelites had gone forth from the land of Egypt, on that very day, they entered the wilderness of Sinai. Having journeyed from Rephidim, they en-

tered the wilderness of Sinai and encamped [here the verb is plural: *va-yahanu*] in the wilderness. Israel encamped [here the verb is singular: *va-yihan*] there in front of the mountain.”

To draw the moral of these verses the homilist first invokes a verse from *Proverbs* in which the subject is the excellence of wisdom, which for the homilist and his audience is already understood as the Torah. Then *Proverbs* 3:17—“Its [wisdom’s] ways are ways of pleasantness, and all its paths are peace”—is made to shed light on the *Exodus* report. Thus the Holy One, blessed be he, actually wished to give the Torah to Israel at the time they left Egypt, but the Israelites kept quarreling with each other, saying all the time, “Let us head back to Egypt” (*Nm.* 14:4). Note what is written (*Ex.* 13:20): “They set out from Succoth and encamped at Ethan”—both verbs are in the plural, for as the Israelites moved on (“set out”), they quarreled, and as they halted (“encamped”), they quarreled; but when they reached Rephidim, they all made peace and became a united assembly (a single band). (And when is the Almighty exalted? When Israel forms a single band, as it is said [*Am.* 9:6], “His band he founded on the earth” [*Lv. Rab.* 30.12, 710]—possibly an appeal not to break up into conflicting sects.) How do we know that they all became a united assembly? For the verse (*Ex.* 19:2) says, “Israel encamped there in front of the mountain,” and this time the verb is in the singular: *va-yihan*; it is not written, “they encamped,” with the verb in the plural, *va-yahanu*. Said the Holy One, blessed be he, the Torah, all of it, is peace (-loving); to whom shall I give it? To the nation that loves peace. Hence (*Prv.* 3:17), “and all its paths are peace” (*Mekhilta’* 2.200; *Lv. Rab.* 9.9, 188; *Tanhuma’* on *Ex.*, ed. Buber, 37b, 9).

A number of elements, typical of *midrash* as a whole, appear in this passage. To begin with, there is the association of a verse “far removed” (in *Proverbs*) with the particular verse (in *Exodus*) to be interpreted—which is meant to demonstrate that all parts of scripture endorse each other and that it can be shown, when necessary, that they are not in conflict. Second, there is meticulous attention to minutiae—the significance even of shifts from plural to singular (by dropping one consonant)—from which an important lesson can be derived. Third, verses are cited at every opportunity to serve as proof text; in many *midrashim* this feature is even more lavishly exhibited than in our passage, and there is no trace of their authors’ possessing concordances to help them in their search for apt quotations. Finally, of course, there is the chief theme with which the *midrash* may be concerned, in our case, the theme of peace (which may be a warning against sectarianism or even an exhortation not to contemplate rebellion against the ruling powers). That study of the Torah thrives on peace and leads to peace is what the midrashic and Talmudic sages frequently tried to stress.

GOALS AND THEMES OF THE MIDRASH. There are very many *midrashim* even more complex in their structure and content, but basically it may be said that all midrashic teaching under-

takes two things: (1) to explain opaque or ambiguous texts and their difficult vocabulary and syntax thus supplying us with what we would call literal or close-to-literal explanation or, for lack of that, purely homiletical guess; (2) to contemporize, that is, so to describe or treat biblical personalities and events as to make recognizable the immediate relevance of what might otherwise be regarded as only archaic. As we have seen, a scene from the account of the revelation of the Ten Commandments becomes a homily on Torah and peace. Patriarchs will be described as mourning for the destruction of the Temple. Esau comes to represent the Roman empire. The twelve sons of Jacob become extraordinary military heroes. And so it goes for the rest of scripture: the past addresses the present, directly or indirectly, and drops hints of the future. There are midrashic interpretations that grow out of both a lexical problem in the verse and the desire to apply the explanation to the thinking and need of the later age. For example, for *ve-anvehu* (“and I will glorify him” [*Ex.* 15:2]) Abba’ Sha’ul says, “Take after him [*ani ve-hu*’; lit., ‘I and he’], even as he is gracious and compassionate, so should you be gracious and compassionate”; thus a meaning of the problematic *anvehu* is provided and along with that the moral lesson of *imitatio dei* (*Mekhilta’* 2.25).

Although, as I have said earlier, the midrash takes into account whatever scripture refers to, there are at least three themes to which much reflection and commentary are devoted. The first is the absolute unity and incomparability of God. The cue for this is of course in scripture (*Dt.* 6:4 and elsewhere), but the kind of emphasis given is essentially post-biblical—that is, that no dualism or plurality of gods is to be tolerated; no worship of God is to be modeled after pagan worship; that regardless of what overtakes Israel, God’s justice is not to be denied; that unlike frequent frivolous treatment of their gods by the pagan world, Israel must love God absolutely, with no reservations, come what may. In the *midrash* God may be spoken of anthropomorphically; this does not embarrass the sages; they know that such speech is metaphorical and inevitable (therefore its presence in scripture itself); what they fear is blasphemy and anything that can lead to the desecration of God’s name.

A second recurring theme is Israel—that is, Israel of the biblical past, Israel of the present, and the ideal Israel of the age to come. To the patriarchs of Israel there had already been the promise that God would maintain a unique relationship with their descendants. And though God may grow angry at them and visit them with punishments and disasters, the bond between God and their people is a permanent one (see also *Ezekiel* 20:30–44). Israel is under obligation to carry out his commands, and in midrashic and Talmudic centuries this meant not merely the commands as formulated “briefly” in the scriptures but as interpreted at length by the sages: “If you do not hearken unto me’ (*Lv.* 26:14), that is, if you do not hearken to the interpretation, the instruction [*midrash*] of the sages” (*Sifra’* 111b; see also *Sifrei, Dt.* 49, ed. Finkelstein, 114f.). Along with this fundamental view come all

sorts of promises of ultimate reward for adherence to the terms of the covenantal relationship and all sorts of regulations concerning how Israel is to remain distinct from the nations of the world in whose midst Israel of the present must live. The self-consciousness demanded by the original covenant and its subsequent reaffirmations is not merely taken for granted or left implicit; it is repeatedly articulated.

No less pervasive is the third theme, that of Torah, which has two meanings, often simultaneous but often also distinct, and it is not always easy to decide which is intended. The word *torah* can stand both for the study of the Torah and for putting into practice the teachings of the Torah. While obedience to the commands of the Torah is already a frequent biblical injunction, what especially characterizes the demands of the sages in the *midrash* is their tireless exhortation that all must study Torah, that neglect of study is not just a sign of a poor education but a deficiency in one's role in life. The sages do not deny that one may merit a share in the life of the world to come even if he is not a scholar or student. But this hardly satisfies them, and ever and again they return to the duty and privilege of Torah study. It is a person's required curriculum from the time he begins scripture study at the age of five—from the time he begins to speak, he should be taught selected verses on the theme of Torah—until the day of his death. Many hyperbolic sayings occur in this connection, and these are indicative of the lengths to which the sages were prepared to go in order to impress on all classes in society, rich and poor, the supreme obligation and value of Torah study. It is the emphasis on Torah study, indeed, that gradually transformed the originally prophetically oriented religion of Judaism into an intellectually directed religious experience in which scholars are the elite.

THE PROCESS OF COMPOSITION. The bulk of aggadic *midrash* commentary which we possess very likely came into being as homilies in connection with the Torah reading as part of synagogue worship. Unfortunately, it is still impossible to fix the time when public Torah reading was first institutionalized. It was certainly in existence by the end of the last century BCE and the first century CE, for Philo Judaeus, Josephus Flavius, and the New Testament all refer to the study and exegesis of Torah (and prophetic selections) as a weekly Sabbath program. The weekly reading (in Palestine, according to a three-and-a-half-year cycle) served as the principle of organization, the scheme of arrangement for the midrashic homilies.

The different midrashic compilations display a certain variety of composition—there are *midrashim* that comment on the biblical text verse by verse (exegetical *midrashim*; e.g., *Genesis Rabbah*) and those that comment only on the opening verse or verses of the pericope and then move on to the next biblical unit (homiletical *midrashim*; e.g., *Leviticus Rabbah*) In these exegetical and homiletic *midrashim*, before the principal midrashic interpretation there may be an introductory homily or homilies, *petiḥta*, *petiḥata*, or proems, as a

kind of overture to the principal interpretation; perhaps (as suggested by Joseph Heinemann in *Scripta Hierosolymitana*, 1971) these served as brief sermons before the Torah reading. Tanḥuma' Yelammedenu *midrashim* tend to introduce the aggadic discourse by citation of a halakhic question and answer, doubtless not only to convey a rule of practice but to underscore that *halakhah* and *aggadah* are one in aim. There are midrashic texts drawn up for the round of special days in the year, feasts and fast days and other appointed occasions (e.g., *Pesiqta' de-Rav Kahana*). There are still other compilations, but what is significant is that in all these texts, regardless of stylization, there is created an intellectual, didactic, hortatory tone which all the *midrashim* share, and thus all the *midrashim* sound as though they all were in manner or approach alike. At a later time (from about the seventh century on), midrashic views are combined to create a literary composition—for example, on the sacrifice of Isaac or Abraham, on the rabbinic martyrs of the Hadrianic period, on Abraham's discovery of and commitment to the one God, on the death of Moses, and so forth.

There seem occasionally to have existed books of *aggadah* even in rabbinic times, but the rabbis disapproved of them. Like all other branches of study, except for scripture, aggadic *midrash* was delivered and attended to as part of the oral law, that branch of the total tradition that was not to be put in writing: midrash, Mishnah, targum, Talmud, the *halakhot* and the *aggadot*—in other words, what the rabbis taught.

The creators of the aggadic *midrashim* were the rabbis, but this does not mean that they drew only on scholarly sources or had only scholarly exposition in mind. The rabbis did draw on these, especially when biblical terms were difficult; but they also drew on folklore, on popular legends, on anecdotes, on deliberately imaginative identifications which would make the passage they were interpreting intelligible and also surprising to their audience. They might use current Greek words and epigrams to add special vividness to their interpretation. They might adopt allegorical methods of explanation. Everyone, including women and children, attended the synagogue to hear the preacher. Midrashic method became so popular that even nonscholarly men could express themselves in the form, or so the *midrash* relates. For example, a rabbi's ass driver undertakes to refute a Samaritan when the rabbi himself is at a loss for a proper retort (*Gn. Rab.* 32.10, 296f.); an unlearned man offers an interpretation of a verse the rabbi had not thought of, and the rabbi promises the man that he will use that interpretation in a sermon in the man's name (*ibid.*, 78.12, 932f.). When a homily is admired, one might praise it as "a precious gem."

Exposure and attention to aggadic *midrash* were certainly widespread, especially when the hearts of the people craved comforting. But aggadic *midrash*, as I have mentioned, was also part of the oral law and was also a subject of the *beit ha-midrash*, the academy. There is no lack of comments emphasizing the value of this study, but the very repetitions in favor

of *aggadah* create the impression that scholars had to be encouraged again and again not to neglect it. Early allegorists said, "If you wish to recognize him who spoke and the world came to be [i.e., if you wish to have correct thoughts about the creator of the universe], study *aggadah*, for it is thus that you will recognize him who spoke and the world came to be and cleave to his ways" (*Sifrei Dt.* 49, ed. Finkelstein, p. 115). The superlative estimate of *aggadah* is here evident: what leads one to a proper knowledge of God and to attachment to his ways is to be found not in pursuit of halakhic studies (alone?) but in reflection on the acts of God as described in many places of the *aggadah*. But the feeling is inescapable that such sentiments imply a criticism of those scholars who, because they are chiefly masters of the law, experts in the complex disciplines of dialectic and halakhic subtleties, tend to regard *aggadah* condescendingly. The very freedom of speculation it permits and its very lack of fixed rules of mandatory conduct probably make the sages uncomfortable. Moreover, the exacting analytic exercises demanded by *halakhah* may have made single-minded halakhists feel superior to that which appealed to popular taste. On the other hand, for the folk as a whole the *aggadah* was a perennial refreshment of spirit and of the courage to endure. This the scholars did not deny, and that experience of refreshment remained true for centuries to come.

PRINCIPAL COMPILATIONS. The following is a list of the principal midrashic compilations and treatises; critical editions are listed briefly within parentheses. Particular but non-critical editions are listed without parentheses.

First are the tannaitic *midrashim*; these are essentially halakhic, but they contain a good deal of aggadic material as well:

1. *Exodus: Mekhilta' de-Rabbi Yishma' e'l* (edited by Jacob Lauterbach; a second edition was edited by Hayyim Horovitz and Israel Rabin) and *Mekhilta' de Rabbi Shim'on bar Yoh'ai* (edited by Jacob Epstein and Ezra Melamed).
2. *Leviticus: Sifra'*, edited by I. H. Weiss. There is also an edition by Meir Ish Shalom [Friedmann] that is critical but only a beginning; Louis Finkelstein has published Vatican Manuscript Codex Assemani LXVI of the treatise with a long and instructive introduction. Finkelstein's critical edition of *Sifra'* has begun to appear.
3. *Numbers: Sifrei de-vei Rav*, and *Sifrei zuṭa'* (both edited by Horovitz).
4. *Deuteronomy: Sifrei* (edited by Finkelstein) and *Midrash Tanna'im*, edited by David Hoffmann.

The following are aggadic *midrashim* from the amoraic period (c. third through fifth or sixth century) to the thirteenth century:

1. The collection known as *Midrash Rabbah* on the Pentateuch and the Five Scrolls (*Song of Songs*, *Ruth*, *Lamentations*, *Ecclesiastes*, and *Esther*). The individual works

were drawn up in different times: *Genesis Rabbah* (edited by Julius Theodor and Chanoch Albeck), from the late fourth to early fifth century, is the earliest, and just a little later is *Leviticus Rabbah* (edited by Mordecai Margulies). For *Deuteronomy Rabbah*, see also the edition by Saul Lieberman. On this collection as a whole, see Zunz (1892).

2. *Tanḥuma'* on the Pentateuch and *Tanḥuma'*, edited by Solomon Buber.
3. *Pesiqta' de-Rav Kahana'* (edited by Bernard Mandelbaum).
4. *Midrash Tehillim* (Midrash of the Psalms), edited by Buber.
5. The Yemenite *Midrash ha-gadol* on the Pentateuch, by David ben Amram Adani (thirteenth century), which draws on earlier midrashic compilations (some no longer extant) and even Maimonides to form a collection of its own: *Genesis* and *Exodus* (edited by Margulies); *Leviticus* (edited by Nahum Rabinowitz and Adin Steinsalz); *Numbers* (edited by Solomon Fisch; a second edition was edited by Tsevi Rabinowitz); *Deuteronomy* (edited by Fisch).
6. *Yalqut Shim'on*, also of the thirteenth century, by a rabbi Shim'on, which gathers its material from many earlier *midrashim* and covers the whole of Hebrew scriptures.

BIBLIOGRAPHY

On all this literature see the classic presentation by Leopold Zunz, *Die gottesdienstlichen Vorträge der Juden* (1832; 2d ed., Hildesheim, 1966) but even better the Hebrew translation thereof, *Ha-derashot be-Yisra'el* (Jerusalem, 1947), which is brought up to date and corrected by Chanoch Albeck in the light of later research. Other midrashic collections not listed here, albeit of considerable importance, are also described and discussed in this work.

The best presentation of the sages as aggadic teachers is Wilhelm Bacher's *Die Agada der Tannaiten*, 2 vols. (1884–1890; reprint, Berlin, 1965–1966); *Die Agada der palästinischen Amoräer*, 3 vols. (Strasbourg, 1892–1899); and *Die Agada der babylonischen Amoräer* (Strasbourg, 1878). Bacher introduces each of the principal teachers separately, organizes the teachings around major categories as embodied in many scattered sayings, and comments on them. This work is also available in Hebrew translation by A. Z. Rabinowitz. See also E. E. Epstein-Halevi's *Ha-aggadah ha-historit biyyogerafit le-or meqorot Yevaniyim ve-Laṭiniyim* (Jerusalem, 1973).

The nature of Judaism as a religion as it emerges from aggadic *midrash* especially (but not exclusively) is best represented by Solomon Schechter's *Some Aspects of Rabbinic Theology* (London, 1909), reprinted as *Aspects of Rabbinic Theology* (New York, 1961); George Foot Moore's *Judaism in the First Three Centuries of the Christian Era, the Age of Tannaim*, 3 vols. (1927–1940; reprint, Cambridge, Mass., 1970); Joseph Bon-

- sir-ven's *Palestinian Judaism in the Time of Jesus Christ*, translated by William Wolf (New York, 1964); and E. E. Urbach's *The Sages: Their Concepts and Beliefs*, 2 vols., translated from the second Hebrew edition by Israel Abrahams (Jerusalem, 1975). For additional reading one may consult the selected titles listed below.
- Albeck, Chanoch. "Introduction." In *Genesis Rabbah*. Edited by Chanoch Albeck and Julius Theodor. Berlin, 1931. Reprinted under the title *Midrash: Rabbath Genesis*. Jerusalem, 1965.
- Bickerman, Elias J. "La chaîne de la tradition pharisienne." *Revue biblique* 59 (1952): 44–54.
- Fischel, Henry A. *Rabbinic Literature and Greco-Roman Philosophy: A Study of Epicurea and Rhetorica in Early Midrashic Writings*. Leiden, 1973.
- Ginzberg, Louis. *Legends of the Jews*. 7 vols. Translated by Henrietta Szold et al. 1909–1938. Reprint, Philadelphia, 1946–1955.
- Goldin, Judah. *The Song at the Sea*. New Haven, 1971.
- Halperin, David J. *The Merkabah in Rabbinic Literature*, American Oriental Series, no. 62. New Haven, 1980.
- Heinemann, Isaak. *Darkhei ha-aggadah*. Jerusalem, 1970.

JUDAH GOLDIN (1987)

MIDRASH AND AGGADAH [FURTHER CONSIDERATIONS]. Scholarship on midrash and aggadah grew exponentially during the last two decades of the twentieth century. As a result, many of the areas covered by Judah Goldin in the first edition of this *Encyclopedia* have been subjected to further academic scrutiny and changed consensus. New avenues of inquiry have opened and are discussed here. This essay primarily covers the ideas and works of authors who have been active since the 1980s. The updated bibliography briefly annotates the works cited here.

ORIGINS OF MIDRASH. Goldin's assumptions regarding the biblical origins of midrash have been buttressed in a number of works. This insistence on biblical antecedents has been exhaustively demonstrated by Michael Fishbane (1985) and also linked to the scribal and wisdom circles of the late Second Temple era by James Kugel (1986, 2001). It should be noted that this tracing of the lineage of the midrash to its biblical roots is somewhat apologetic in nature in that it depicts rabbinic activity as preexistent within the canon and as the natural outgrowth from it. Nevertheless, the prerabbinic origins of midrash and aggadah are now considered well established.

COMPARISON WITH OTHER LITERATURES. The work of comparison of rabbinic literature and its exegetical activity with that of Hellenistic authors continues apace. Henry Fischel (1977) edited an anthology of essays on the issue, and he appended a thoroughly annotated bibliography. It is now a given in scholarly circles that midrashic literature sits quite comfortably within a Hellenistic milieu, as demonstrated in the Stroum Lectures by Lee Levine.

At the same time, scholarly attention has turned to comparison of the midrashic works of the rabbis with those of the Church Fathers. Here, the commonalities of their exegetical techniques are explored, and areas of rabbinic polemic against the church are also considered. The work of Burton L. Visotzky (1995) includes a consideration of methodology in these areas as well as a survey of recent scholarship on the topic. This comparison of rabbis and Church Fathers builds on the earlier comparative work done with Hellenistic literature and recognizes the common intellectual patrimony that both rabbis and Church Fathers owe to their Hellenistic forbears.

TEXTUAL CRITICISM AND TRANSLATION. The production of critical editions of rabbinic works of midrash and aggadah also continues. New editions, such as those of *Exodus Rabbah—Part I* (Shinan, 1984), *Midrash Mishle* (Visotzky, 1990), and *Pesiqta Rabbati* (Ulmer, 1997), now share a place on scholarly bookshelves. Other scholars, including Menahem Kahana (1999) and Menahem Kister (1998), published preliminary studies to critical editions. Although a debate continues between scholars such as Peter Schäfer (1986) and Chaim Milikowsky (1988, 1996) regarding the proper form such a critical edition should take, there is a growing interest in the use of electronic media in the production of online virtual editions and CD-ROM texts with search capabilities. This trend promises to enhance further scholarly activity in the study of midrash and aggadah and potentially obviate the debate regarding printed text editions.

A broad variety of translations into English were published in the last two decades of the twentieth century. Four principal publishing programs have enhanced this scholarly translation movement. Jacob Neusner and his students translated much of the library of rabbinic literature, including works on midrash and aggadah. The Yale Judaica Series and the Jewish Publication Society also have continued to pro-

duce high quality, annotated English translations of classic rabbinic works. Finally, the Soncino Press continues to reprint their earlier, yet still reliable translations. All in all, most major works of midrash and aggadah now are available in English translation.

FROM HISTORY TO LITERATURE. During the two-decade period that closed out the twentieth century, under the influence of the work of Morton Smith and his students (e.g., Jacob Neusner, Lee Levine, Shaye J. D. Cohen, and Seth Schwartz), there has been a decisive move away from treating works of midrash and aggadah as evidence for the history of the rabbinic period. This group of historians, writing primarily in North America, determined that rabbinic literature is largely undependable for historic documentation. The reasons for this vary, but include the lack of reliable attributions of traditions to given named rabbis, the insecure dating of traditions within rabbinic documents, and the didactic literary forms of the legends themselves.

In place of this negativist assessment and concomitant with the growth of postmodern literary studies in the greater academy, the study of midrash and aggadah has turned more and more to literary critical techniques for its methodology, as exemplified in the works of Jonah Fränkel (1981) and James Kugel (1990). Treating midrash and aggadah as literature values these texts in their own right and also yields differing results regarding the role of the literature. The recent attention to deconstruction and other postmodernist trends in the broader literary world has also affected the study of midrash and aggadah. The work of Susan Handelman (1982) sought to compare midrash and deconstruction (decisively criticized by David Stern, 1984). A broader anthology of essays linking the postmodernist literary critical movement with midrash was edited by Geoffrey Hartman and Sanford Budick (1986). The thoughtful work of David Stern (1996) is an excellent example of the move to literary theory on midrash and aggadah. In the late twentieth and early twenty-first century there has been a much broader interest in and study of midrash and aggadah as literature than at any time in modern history.

Richard Sarason (1981) led the way in treating midrash as literature rather than as historic documentation. His work caused scholars to cease looking for synagogue settings for what had been presumed to be the collected sermons and homilies of the rabbis. Instead, the works currently are treated as intertextual exegetical exercises by Daniel Boyarin (1990), as miscellanies of various literary and homiletic materials by Burton Visotzky (2003), and artfully edited anthologies by scholars as diverse as Jacob Neusner (1985) and Norman Cohen (1981).

A form of midrash called the *petihah*, or its Aramaic form, *petihtha*, best exemplifies the debate regarding the question of synagogue setting versus literary compilation. Some scholars, including Joseph Heinemann, hold the opinion that this form, which is sometimes translated as a “proem,” is a redacted sermon or an introduction to the weekly trien-

nial Torah lection in the synagogues of the Land of Israel—although they are careful to refer to the form as a “literary homily.” Other scholars, including Sarason (1982) and Visotzky (2003), imagine the *petihah* as a primarily literary or editorial construct, devised as a means of ordering and anthologizing earlier textual and oral traditions. The current trend toward treating midrash and aggadah first and foremost as literature is readily apparent, even when scholars continue to use the historical-critical tools of analysis associated with the old school of *Wissenschaft des Judentums*, such as philology and traditions-history. Günter Stemberger’s (1992) update of Hermann Strack’s classic *Introduction to the Talmud and Midrash* remains the best summary of the now-waning historical-critical avenue of research.

ORALITY AND FOLKLORE. Scholars are also currently considering a newly nuanced view of the oral nature of the midrash and aggadah. Obviously, all of the midrashic works extant are literary, in that they are preserved in a written text form. In the past, however, the debate regarding the origins of these traditions was framed as either there are oral or written materials, with no middle ground. Today, the scholarship of Martin Jaffee (1998, 2001) advocates a blurring of the relationship between the possible oral origins of midrash and aggadah and their written record. Jaffee suggests that each sermon may have been an oral performance of traditional materials and that texts as they now exist may thus be *librettos* or snapshots of given performances of these traditions. Jaffee’s theory helps explain the existence of variant textual traditions, allows for the literary development and editorial redaction of these rabbinic works, and potentially maintains a grip on the theory of oral origins in the “performance” of the synagogue sermon. This area of scholarship offers great promise for future research on understanding the origins and transmission of midrash and aggadah.

Another direction of research related to oral performance is the treatment of some parts of the corpus of midrash and aggadah as folk literature. Particularly in Israel, folklorists such as Dov Noy and Galit Hasan-Rokem treat elements of aggadah as folklore, subjecting it to the types of analyses common in that cross-cultural field of study. Another field of study, still operating under the assumption of an original synagogue setting for midrash and aggadah, displays a growing interest in the nexus of midrash and aggadah with the Aramaic translations of the Torah called *Targum*, notably in the scholarly writings of Avigdor Shinan (1992). Yosef Yalom explores the relationship of both of these genres of rabbinic literature with synagogue liturgical poetry, *Piyyut*.

OTHER SUBCATEGORIES OF MIDRASH. There is growing interest in the subcategories of midrashic literature, as evidenced by the studies in the *petihah* and the genres of *Targum* and *Piyyut*. The parable (*mashal*) in the midrash garnered the interest of David Stern (1981, 1991) and Daniel Boyarin (1985), who debated the role of the *mashal* in the pages of a journal of Jewish literary history. The *mashal* continues to be of interest to those who would compare it to the New Testament parable and forms of Hellenistic *allegoresis*.

The religious ideas expressed in midrash and aggadah also remain of great interest to students and scholars alike. The theological ideas of the literature and their relation to Christian or Hellenistic philosophical thought of the Late Antique period of Roman history are discussed by a broad range of both Jewish and Christian scholars. Rabbinic theology is decidedly unsystematic and is expressed, instead, through *mashal*, various exegeses, and narratives. Michael Fishbane (2003) has considered the varying modes of rabbinic mythopoesis, the ways in which the rabbis reshape and expand earlier biblical and ancient Near Eastern myth. The beginning of a broad intellectual history of rabbinic thought has also been ably explored by David Kraemer (1990).

MIDRASH AND AGGADAH. This discussion of the ideas of midrash and aggadah leads to a consideration of rabbinic literature as composed of two interrelated, yet distinct modes of narrative. In the first, midrash, the rabbis perform exegesis of Scripture, playfully yet seriously unpacking the Sacred Writ. However, rabbinic exegesis of Scripture, which might be construed as narrowly focused explication of biblical words and phrases, can and often does yield narrative, as demonstrated by Israeli scholars Ofra Meir (1987) and Fränkel.

In the second mode of narrative, aggadah, the rabbis employ a style less directly tethered to Scripture, often in the form of Sage Tales about one another. These Sage Tales, although emphatically not biography, are a form of religious didactic fiction, a Jewish version of the legends or *Lives of the Saints*. This latter aggadah is the subject of intensive study relying on literary techniques such as New Criticism in the works of Fränkel and his American student Jeffrey Rubenstein (1999). Further consideration of this type of rabbinic narrative has been done under the rubric of new historicism by Daniel Boyarin (1993). The results of these various studies yield a corpus of rabbinic short stories, as it were, which express the religious and social ideas of the rabbis through tales and legends about the characters who are the very authors of the literature itself.

IMPACT OF FEMINISM. Feminist theory is one of the other manifestations of postmodern literary criticism that has had a profound impact on the study of midrash and aggadah. In this arena, there is still a great deal of criticism needed, and such studies as those of Judith Baskin (2002) help lay the groundwork by explicating texts about women in rabbinic literature. The work of Miriam Peskowitz (1997) offers a gendered reading on all aspects of rabbinic literature and bears a great deal of fruit as a sophisticated methodology with roots in feminist studies.

Feminism and this new approach to midrash also gave birth to an outpouring of creative writing about women in biblical narratives. In some instances, a Bible story is retold from the perspective of a woman character. In further instances, voice is given to female characters who otherwise are silent. Works such as Anita Diamant's *The Red Tent* (1997) achieved enormous commercial popularity. Many other

studies offer feminist perspectives on biblical narratives, and these, too, contribute to what is being called modern midrash. Norma Rosen's *Biblical Women Unbound* (1996) is a representative work of this latter genre of current fiction.

OTHER FORMS OF MODERN MIDRASH. In addition to feminist studies, other types of modern midrash are burgeoning in creative areas as diverse as fiction, poetry, television and film. In fiction, older works such as that of Thomas Mann's *Joseph and His Brothers* (1948) have been supplemented by writings such as Israeli author Shulamit Hareven's *The Miracle Hater* (1988). The nexus of midrash and aggadah with poetry is ancient, going back to classical *piyyut*. In the modern era, Israeli writers in particular offer poetry that contemplates biblical themes, such as the works of Dan Pagis and Yehuda Amichai. Again in Israel, a great deal of television programming has been devoted to midrashic explorations of the Bible. In the United States, in addition to the regular fare of costume-dramas, public television has taken up "Genesis: A Living Conversation," in a ten-hour series hosted by Bill Moyers. Finally, even Hollywood produced modern midrash, most notably the animated feature *Prince of Egypt*.

In summary, the study of midrash and aggadah continues to expand in both academic and popular settings. The annotated bibliography that follows offers sources for more in-depth study.

BURTON L. VISOTZKY (2005)

MIGRATION AND RELIGION. Migration almost always affects religion. This is so because when people migrate to a new place they alter routines of daily life, and new experience inevitably acts upon even the most tenaciously held religious tradition. Conversely, religion often inspires migration.

RELIGIOUS MOTIVES. Organized religious groups may decide to move to a place where their pursuit of holiness will face fewer obstacles. Some successful colonies of this kind played important historic roles by defining patterns of conduct for larger, less religiously incandescent communities that succeeded them.

Among Christians and Muslims, though rarely for other religions, armed migration also played an important part in spreading and defending the faith. Crusade and *jihād*, between them, defined the frontier between *Dār al-Islām* and Christendom for more than a millennium, from the first Muslim conquests of the seventh century until the secularized statecraft of the eighteenth pushed religious antipathy to the margins of military enterprise. The Muslim conquest of India (eleventh to seventeenth century) was likewise sustained by a flow of fighting men who came to Hindustan in order to combat infidelity, and, perchance, to acquire fame and wealth in the process.

Personal and private pursuit of holiness has also inspired innumerable pilgrims to visit shrines that are usually located where their religion originated or had its earliest efflorescence. A contrary flow of holy men beyond the frontiers of the society of their birth has often led to the conversion of strangers, even across linguistic and cultural barriers. Overall and in general we may therefore say that religiously inspired migration, whether peaceable or warlike, had a great deal to do with the definition of civilizational and cultural frontiers in historic times.

Pilgrimage affirmed and helped to homogenize religious and secular culture within each civilization. It became especially important for Islam. Long after the caliphate collapsed, the thousands of pilgrims who traveled to Mecca each year from all over the Muslim world maintained a loose but effective unity among the community of the faithful. Holy war and peaceable conversion on the other hand, enhanced heterogeneity by bringing new populations within the circle of one or another religion from time to time. Diversity did not bother Hindus and Buddhists very much, but new frictions arose among Jews, Christians, and Muslims with every missionary success, since converts inevitably retained some remnants of older "pagan" outlooks and habits. For these faiths, therefore, local and sectarian diversity remained in perpetual

conflict with the ideal of uniform and punctilious obedience to God's will as authoritatively defined by religious experts and administrators.

Second only to crusade and counter-crusade, religiously inspired collective migrations offer the most dramatic manifestations of how human motility and religiosity interact. The migrants' goal, of course, is to find a place where the will of God can be more perfectly obeyed. Undoubtedly, most sectarian enterprises of this sort do not last very long. The mass suicide of Jim Jones's followers in the jungles of Guyana in 1978 was a reminder of how such ventures may collapse in grisly failure. At the other extreme, the Puritans of Massachusetts and the Mormons of Utah dominated their chosen localities for generations and still influence the mainstream of American life. In Russia, communities of Old Believers played almost as prominent a part, for they, too, thrived on the frontiers and influenced the wider community around them by pioneering privately managed trade and industry in the eighteenth and nineteenth centuries.

In the deeper past, monastic communities offered the most important examples of collective migration undertaken for religious reasons. Buddhist, Daoist, Shintō, and Christian monasteries were often set up in remote rural localities where the monks' devotion and learning propagated and sustained the faith among surrounding populations while also providing a focus for economic exchange and (at least sometimes) for political activity as well. Such monastic centers were especially important in times and places where towns were absent or poorly developed, and tended to become marginal in proportion to the rise of secular urban centers.

The initial establishment of such monasteries was achieved by deliberate, collective migration of bodies of monks or nuns. Subsequent recruitment came from far and wide, since the inhabitants did not reproduce themselves. Monastic establishments thus depended on and could only thrive by retaining connection with the currents of personal migration in search of holiness that flowed within (and sometimes between) each of the Eurasian civilizations.

Private, personal migration for religious reasons is difficult to document since itinerant holy men, living on alms, seldom recorded their experience in writing. The forest retreats of ancient India where the Upaniṣads were generated constitute the oldest attested examples of personal, private migration away from the toils of ordinary society in order to pursue religious enlightenment and truth. They were, perhaps, archetypal. At any rate, India's warm climate was propitious since it allowed seekers after holiness to survive on little food and with little clothing. The ascetic way of life, in turn, encouraged and sustained mystic visions of transcendental reality—visions that validated the holy way of life and confirmed the aspiration of escaping from the ills of this world by entering into contact with suprasensory reality.

Transient and personal master-disciple relationships among Indian holy men took a new and enduring form

among the followers of Gautama, the Buddha. For, on the occasion of his death (484 BCE), the Buddha's followers defined a holy way of life that combined itinerant mendicancy with periods of rest and recuperation in specially constructed monasteries. Following this regimen, Buddhist monks soon penetrated far beyond the borders of India, traveling along the caravan routes of Asia to the Far East and boarding merchant vessels bound for Southeast Asia as well. In ensuing centuries, holy men of other faiths (Manichaeans and Nestorian Christians especially) adopted similar modes of life. Later still, Daoists and adherents of Shintō established monastic communities modeled more or less closely on the Buddhist prototype.

Wandering holy men, whether of the Buddhist or some other persuasion, had much in common with the merchant-peddlers who frequented the same trade routes. Indeed, these itinerant holy men *were* a kind of merchant whose stock-in-trade consisted of esoteric knowledge and personal experience of the transcendental world. They lived, in effect, by exchanging their special access to the supernatural for the alms that sustained their bodily wants.

Mainstream Christianity and Islam went in opposite directions in developing the Buddhist pattern of religiously motivated migration. Early in the history of Christian asceticism, monastic rules inhibited the private pursuit of holiness by itinerant almstakers. Yet this did not prevent the systematic establishment of new monasteries at distant frontier locations. Rather, monasteries played a leading role in spreading Christian civilization beyond the borders of the Roman Empire, both in the west among Germanic peoples and in the east among the Slavs. Then, after the voyages of discovery by Europeans during the sixteenth century, missionary orders met with enormous success in converting Amerindians to Roman Catholicism, but failed to win many Asians or Africans to their faith. Protestant missions flourished mainly in the nineteenth century, and probably converted more Asians and Africans to the secular aspects of Western civilization than to their various versions of Christianity.

Within the realm of Islam, on the other hand, the initial effort to make the entire community perfectly obedient to God left no room for monks or any other kind of specially holy personages. The Qur'an accordingly forbade monastic vows. As a result, when the first burst of conquest came to a halt, pious Muslim merchants took over the missionary role that had been exercised for other faiths by monks and other religious specialists. Thus with the advent of Islam the convergence between missionary and merchant, already apparent in Buddhist practice, became complete.

To be sure, from the twelfth century onward, dervish communities, somewhat analogous to the monastic orders of other religions, arose within Islam. They flourished most in the frontier lands where the expanding Turkish power encountered the Christian populations of Asia Minor and the Balkans. Dervish forms of piety had an important role in

converting Christians to Islam along that frontier, but the dervishes never escaped the taint of heterodoxy.

There is profound irony in the upshot of all these various religiously motivated patterns of migration. Puritans of New England as much as Old Believers in Russia, along with all the variegated company of monks and holy men who propagated Hinduism, Buddhism, Christianity, and other faiths along remote frontiers, all sought to escape from the corruptions of civilized society as exemplified in their initial homelands. Yet the net effect of their efforts at withdrawal and pursuit of a more perfect obedience to the precepts of their religion was to spread civilized skills and knowledge among previously simpler societies. Institutional success in the form of flourishing monastic or civil communities, dedicated to holiness though they might be, perversely propagated the very corruptions of civilization which the founders had so earnestly wished to escape from. Of course, discrepancy between intentions and accomplishments is normal in human affairs, but the gap is seldom so patent as in these instances.

SECULAR MOTIVES. Migration undertaken for other than religious reasons also had the overall effect of spreading civilized complexity. Its immediate impact on religion was usually to provoke some sort of blending of old and new traditions as immigrants encountered new peoples and new conditions of life along with alien faiths and religious practices. But religious interactions exhibited many variations, depending on conditions of the encounters and on choices individual leaders and teachers made in coping with unprecedented novelties.

If one seeks to make sense of such diversity it is useful to distinguish between migrations that carry a particular population up a cultural gradient and migrations that carry people in an opposite direction toward frontiers where civilized institutions weaken or disappear.

A people that moves up a cultural gradient may do so as conqueror or captive. Peaceable infiltration of individuals or small family groups is also theoretically possible but remained statistically unimportant until the nineteenth century, when the advent of superior public peace, efficient communications, and mechanically powered transport made that kind of migration feasible on a mass scale for the first time. It follows that the Israelites' conquest of Canaan on the one hand and the African slave trade on the other are the appropriate models for most historical migration, unlike the sort of individual and family migration that did so much to populate the United States between the 1840s and 1920s.

In matters of religion, conquerors and captives alike have three options when arriving in lands whose skills are superior to their own. The newcomers may accept the established religion of the land to which they have come, retaining only a few telltale traces of their own older practices. The Akkadian invaders of ancient Sumer seem to have accepted this option at the very beginning of civilized history; Turks com-

ing into the realm of Islam either as slaves or as conquerors did the same. So did the African slaves imported to North America to work on plantations.

Slaves had little choice as a rule. Forcibly separated from the social context that had nurtured them, they could not, as more or less isolated individuals, carry very much of their native religion with them. Conquerors, however, were in a position to choose. Nevertheless, simple maintenance of accustomed rites and ideas was seldom possible. New experiences, ideas, and circumstances crowded in on successful conquerors. To resist their subjects' religions took a special effort, all the more difficult in view of the fact that the established rituals of the land were already adapted to the circumstances of civilized and agricultural life.

The Bible record shows how hard it was for the Israelites to maintain their desert faith in the land of Canaan after settling down to an agricultural existence. Energetic, violent means were needed to repress Baal worship. This was the work of kings and prophets, who in reaffirming the old religion in fact transformed it. That transformation is what made Judaism so enormously influential in the world at large, but its influence also attests the exceptional character of the prophetic response to the conditions of agricultural civilization.

Other invaders who rejected the religion of the land they had conquered were nonetheless affected by contact with people of a different faith. This happened even when the subjected population accepted the faith of their conquerors en masse. The contamination of Turkish Islam with Christian elements was a pronounced feature of Ottoman life, for example, while the Mughals in India alternated between a policy of permitting and resisting the parallel contamination of their faith with Hindu practices and ideas. A similar situation prevailed in the crusading states of the Levant, and when the Mongol Empire was at its height, Khubilai Khan's policy of patronizing all available religions, so as not to foreclose any avenue of access to the supernatural, shocked and puzzled Christians and Muslims alike.

A third policy that attracted many "barbarian" conquerors was to try for the best of both worlds by espousing a heretical form of civilized religion. This marked the conquerors off from their subjects and helped to maintain a collective *esprit de corps* among the invaders, while also allowing the new rulers to benefit from advantages of civilized religion—for example, literacy, an authoritative scripture, and a hierarchical priesthood. The German tribesmen who adhered to Arian Christianity when invading the Roman Empire in the fourth and fifth centuries followed such a policy. The Uighurs, who became Manichaeans, and the Khazars, who became Jews, illustrate a variation on the same theme, for the religions of their choice served to mark them off from neighbors and subjects while at the same time offering rulers the support of a fully civilized faith.

Nevertheless, such barbarian polities were transitory and so were the heresies they found attractive. The reactions that

mattered were assimilation to civilized forms of religion on the one hand and inventive rejection on the other that has been so central in the history of Judaism, of Shintō, and, since the mid-nineteenth century, to the evolution of Hinduism and Islam as well.

Migrations undertaken for economic or political reasons that carry a people to lands less developed than those they leave behind ordinarily have less impact on traditional religious practices. The Chinese migration from north to south that created the imposing mass of contemporary China, for example, had no very obvious effect on Chinese religion. The same may be said of Japanese expansion northward through their islands and of the German *Drang nach Osten*.

Only in modern times did it become possible for family groups and isolated individuals to migrate safely toward an open frontier. In such circumstances, of course, pioneers left organized religion behind. This prepared the ground for itinerant revivalists. Emotionally vibrant forms of established religion fared best in such circumstances, with conspicuous individual conversion the goal.

Proletarian migrants into cities faced circumstances similar in some important respects to the deculturation and individual isolation of the rural frontier. It is not really surprising therefore that the Methodists who first addressed themselves to unchurched urban populations of Great Britain were also among the most successful on the American frontier.

Other varieties of religious revivalism are currently flourishing among urban immigrants, both in the United States and beyond its borders. Islamic revivalism is the most politically prominent of such movements, but sectarian forms of Christianity also have a vigorous life in American cities and in many developing nations, while offshoots of Buddhism can also be observed making headway in urban contexts, both Eastern and Western. Marxism, too, is no more than a secular heresy competing in this environment for human commitment to its materialist doctrines.

CONCLUDING REMARK. In the world at large, as populations increase and migratory flows swell to unexampled proportions, religious interminglings and interactions—both hostile and pacific—are sure to intensify. The future history of humankind will in all likelihood be written around the clash of religions and cultures that is taking place around us, for secular thought and abstract reasoning are weak reeds by comparison with the tidal flows of faith and feeling that govern human conduct today as much as at any time in the past.

WILLIAM H. MCNEILL (1987)
Revised Bibliography

MI LA RAS PA (MILAREPA) (1028/40–1111/23) was a highly revered Tibetan yogin, famous both for his austere hermetic lifestyle and for the Tantric instructions he imparted through songs of realization. Mi la ras pa is considered an early founder of the Bka' brgyud (Kagyü) sect of Tibetan Buddhism, and therefore an heir to the Tantric tradition of the Indian *siddhas*, or spiritual adepts, Tilopa (fl. tenth century), Nāropa (c. 1016–1100), and Maitripa (1007–1085). He is also esteemed throughout the Himalayan Buddhist world as an exemplar of religious dedication, perseverance through hardship, and meditative accomplishment. Themes principally associated with his life story—purification of past misdeeds, faith and devotion to the *guru*, ardor in meditation and yogic practice, and the possibility of attaining liberation in a single lifetime—have shaped the development of Buddhist teaching and practice in Tibet. Mi la ras pa's biographical tradition also inspired works of significant literary achievement in which readers found not only the portrait of an exemplary life but an exhortation to lead such a life themselves.

As a child, the yogin was called Thos pa dga' (Delightful to Hear) and was later given the Tantric initiation name Bzhad pa'i rdo rje (Laughing Vajra). But the master is ubiquitously known as Mi la ras pa. *Mi la* was his clan name; *ras pa* is derived from the single cotton robe (*ras*) worn by Tibetan anchorites—an attire Mi la ras pa retained for most of his

life. The name is therefore an appellation, perhaps translated as “The Cotton-Clad Mi la.” He is universally addressed with the title *rje btsun*, a word difficult to translate (it is often rendered as “Venerable Lord”) but which carries the meaning of both skillful guide and unsullied master.

Mi la ras pa’s life story has been the subject of a vast hagiographic tradition in Tibet. Perhaps the earliest record of the yogin’s life and teachings is found in an extensive work known as the *Bu chen bcu gnyis* (The twelve great disciples version), purportedly written toward the end of Mi la ras pa’s life by a group of his close disciples. Accounts of the biography soon proliferated, and Tibetan authors writing several centuries later mention the existence of more than one hundred versions of the life story.

In the late fifteenth century, the iconoclastic author Gtsang smyon Heruka (1452–1507), the so-called Madman of Central Tibet, completed what would become Mi la ras pa’s definitive portrait. Beginning in 1488 he published two major works concerning the yogin: a sacred biography, often known simply as the *Mi la ras pa’i rnam thar* (The life of Mi la ras pa), and a collection of versified teachings organized within short framing tales, the *Mi la ras pa’i mgur ’bum* (Hundred thousand songs of Mi la ras pa). Cast as a first person narrative, the *Life* draws upon traditional models of Buddhist hagiography (including the historical Buddha’s pursuit of enlightenment), poignantly describing Mi la ras pa’s childhood, his search for a Buddhist master, and his rigorous practice of solitary meditation. The latter collection presents Mi la ras pa’s teaching career, his assembling of disciples, subjugation of harmful spirits, and forging of a sacred landscape across the Himalayan region. As its name suggests, the work also preserves Mi la ras pa’s primary legacy: his songs of practical instruction and inner realization. The number “one hundred thousand” in the title is a conventional reckoning used to signify a great quantity. Compilations called one hundred thousand songs (*mgur ’bum*) became a popular genre of Tibetan writing, of which Mi la ras pa’s was arguably the most famous example.

While clearly based on earlier accounts, these two works became classics in Tibet. As literary masterpieces of the highest order, they quickly eclipsed all previous accounts of Mi la ras pa’s life. They were also promoted, and promptly accepted, as presenting the authorized version of the saint’s life, which came to be known by generations of readers around the world. Innumerable Tibetan authors refer to Gtsang smyon Heruka’s editions; modern scholars continue to hail Mi la ras pa as “Tibet’s most celebrated saint,” largely based on the popularity of these two works.

Although his dates are debated, biographies agree that Mi la ras pa was born to a prosperous family in the Gung thang region of southwest Tibet. At an early age, after the death of his father, he lived with his mother and sister under the care of a paternal uncle, with the family estate stipulated to return to the boy upon his reaching majority. The rapacious uncle instead appropriated the estate for himself, re-

ducing Mi la ras pa and his family to lives of poverty and privation. At the behest of his mother, Mi la ras pa sought out instruction in black magic and hail making in order to exact revenge upon their manipulative relatives.

In central Tibet, Mi la ras pa found several skilled teachers, fervently applied himself to their instruction, and quickly showed signs of success. Traditional sources describe how, through the power of a particularly effective magical rite, he murdered thirty-five people gathered one evening for the wedding reception of his uncle’s family, sparing his aunt and uncle only so that they could bear witness to his revenge. In retaliation, the surviving relatives conspired to kill Mi la ras pa’s mother. To defend her, Mi la ras pa once again applied himself to the practice of magic, this time destroying the crops of his village under a great hailstorm. Eventually, through the ensuing tumult, Mi la ras pa came to realize the magnitude of his misdeeds. Feeling deep contrition for his past actions, he sought to redeem himself from their karmic effects through the practice of Buddhism. He secured the support of his former magic instructor, promised to devote himself to the *dharmā*, and set out in search of a Buddhist master.

Mi la ras pa briefly studied Rdzogs chen (dzogchen, Great Completion) practice under one lama before meeting his principal *guru*, the great translator of Indian texts Mar pa Chos kyi blo gros (Marpa Chokyi Lodro, 1002/1012–1097). The relationship that developed between Mar pa and Mi la ras pa would become a celebrated example of the link forged between *guru* and disciple in Vajrayāna Buddhism, emphasizing the central role of faith and devotion in the reliance upon a spiritual guide. It is said that the mere mention of Mar pa’s name caused Mi la ras pa’s body to shake with devotion. Mar pa, however, was famous for his quick-tempered and demanding personality, and he did not immediately teach his new disciple. He instead subjected Mi la ras pa to repeated abuse, segregating him from other students and forcing him to undergo various ordeals, such as the famous trial of constructing immense stone towers. Pushed to the brink of despair, Mi la ras pa contemplated escape, and later suicide. Mar pa finally assuaged his disciple, revealing that the trials were actually a means of purifying previous negative *karma*. He explained that Mi la ras pa was, from the beginning, a disciple prophesied by Mar pa’s own *guru*, the Indian *siddha* Nāropa. Mi la ras pa received numerous Tantric initiations and instructions—especially those of *mahāmudrā* and the practice of *gtum mo* (*tumo*), or yogic “inner heat”—together with the command that he should persevere against all hardship, meditating in solitary caves and mountain retreats.

Mi la ras pa spent the rest of his life practicing meditation in seclusion and teaching small groups of disciples, mainly through spontaneous poetry and songs of realization. He had little interest in philosophical discourse and no tolerance for intellectual pretension. His songs are composed in vernacular idioms, abandoning the highly ornamental formal

structures of classical poetry in favor of a simple, direct, and often playful style. Employing metaphors from everyday Tibetan life, they illuminate the nature of mind, emphasize meditation over study, and reflect a love for solitude in nature.

Mi la ras pa traveled widely across the Himalayan region where he attracted a devout following among ascetics and householders alike. Dozens of locations associated with the yogin have become important pilgrimage sites and retreat centers. He spent much of his life in southern Tibet, at caves sites such as Brag dkar rta so (Drakar Taso, White Rock Horse Tooth), La phyi (Lapchi), and Chu dbar (Chubar), and he visited Nepal on several occasions. According to tradition, he secured Mount Kailāsa (Kailash) as a Buddhist pilgrimage site after defeating a priest of the Bon religion in a contest of magic. One account records his stay at the acclaimed Stag tshang (Taksang) hermitage in Bhutan, first consecrated by the eighth-century Indian adept Padmasambhava. Mi la ras pa's disciples, including the illustrious Sgam po pa Bsod nams rin chen (Gampopa Sonam Rinchen, 1079–1153) and Ras chung pa Rdo rje grags (Rechungpa Dorje Drak, 1084–1161), established a lineage of Bka' brgyud masters that continues to play an important role in the dissemination of Tibetan Buddhism.

The figure of Mi la ras pa has likewise remained deeply embedded within the Tibetan religious world. Buddhist practitioners of all sectarian affiliations throughout the Himalayan region still memorize his songs; elaborate temple murals and scroll paintings record episodes from his life story in great detail; monastic dances reenact his meetings with important disciples; Tantric rituals and *guruyoga sādhanas* invoke his presence as an enlightened being; and new generations of Buddhist yogins embark on solitary meditation retreats, often in caves that he is said to have inhabited, with him as a chief inspiration. Mi la ras pa's biographical tradition also played a central role in the study of Tibet by early European and American scholars. Beginning in the late nineteenth century, the *Life* and *Hundred Thousand Songs* were among the first Tibetan texts to receive widespread attention. Compilers of the earliest Tibetan-English dictionaries made frequent use of passage from these works as models of Tibetan literary usage and style. The figure of Mi la ras pa, the tales of his life, and the penetrating wisdom of his songs persist as part of a living tradition within Tibetan Buddhist communities, and now serve as potent symbols of Tibet to the rest of the world.

BIBLIOGRAPHY

The first complete English translation of Mi la ras pa's life story was edited by W. Y. Evans-Wentz (in collaboration with the Sikkimese translator Kazi Dawa Samdup), published as *Tibet's Great Yogī Milarepa* (Oxford, 1928). A modern trans-

lation by Lobsang P. Lhalungpa, *The Life of Milarepa* (New York, 1977), has now largely superseded this pioneering effort. The standard collection of Mi la ras pa's songs appears in Garma C. C. Chang, trans., *The Hundred Thousand Songs of Milarepa: The Life-Story and Teaching of the Greatest Poet-Saint Ever to Appear in the History of Buddhism* (New Hyde Park, N.Y., 1962). Two further volumes of Mi la ras pa's stories and songs have been translated by Lama Kunga and Brian Cutillo in *Drinking the Mountain Stream* (Novato, Calif., 1978) and *Miraculous Journey* (Novato, Calif., 1986). These works are of particular interest since they include material left out of Gtsang smyon Heruka's versions and may therefore offer, in the translators' words, "pieces from the cutting-room floor."

MILLENARIANISM

This entry consists of the following articles:

AN OVERVIEW

CHINESE MILLENARIAN MOVEMENTS

MILLENARIANISM: AN OVERVIEW

Millenarianism, known also as millennialism, is the belief that the end of this world is at hand and that in its wake will appear a New World, inexhaustibly fertile, harmonious, sanctified, and just. The more exclusive the concern with the End itself, the more such belief shades off toward the catastrophic; the more exclusive the concern with the New World, the nearer it approaches the utopian.

MILLENARIAN THOUGHT. Complexity in millenarian thought derives from questions of sign, sequence, duration, and human agency. What are the marks of the End? At what stage are we now? Exactly how much time do we have? What should we do? Although warranted by cosmology, prophecy, or ancestral myth, the End usually stands in sudden proximity to the immediate era. The trail of events may at last have been tracked to the cliff's edge, or recent insight may have cleared the brier from some ancient oracle.

The root term, *millennium*, refers to a first-century eastern Mediterranean text, the *Apocalypse of John* or *Book of Revelation*, itself a rich source of disputes about the End. John of Patmos here describes in highly figured language a penultimate battle between forces of good and evil, succeeded by a thousand-year reign of saintly martyrs with Jesus, and then the defeat of Satan, the Last Judgment, a new heaven, and a new earth. This interim, earthly reign is literally the millennium (from Lat. *mille*, "thousand"; Gr., *chil*, whence "chiliasm," sometimes applied pejoratively to belief in an indulgent, carnal millennium, or "chiliad"). Not all millenarians expect an interim paradise before an ultimate heavenly assumption; not all anticipate precisely one thousand years of peace; not all stipulate a messianic presence or a saintly elite. Like John, however, they have constant recourse to images, for millenarians are essentially metaphorical thinkers.

In theory, as a speculative poetic enterprise, millenarianism is properly an adjunct of eschatology, the study of last

things. In practice, millenarianism is distinguished by close scrutiny of the present, from which arise urgent issues of human agency. Once the fateful coincidence between history and prophecy has been confirmed, must good people sit tight, or must they gather together, withdraw to a refuge? Should they enter the wilderness to construct a holy city, or should they directly engage the chaos of the End, confront the regiments of evil? Millenarians answer with many voices, rephrasing their positions as they come to terms with an End less imminent or less cataclysmic. Where their image of the New World is that of a golden age, they begin with a restorative ethos, seeking a return to a lost purity. Where their image is that of the land of the happy dead or a distant galaxy of glory, their ethos is initially retributive, seeking to balance an unfortunate past against a fortunate future. Few millenarians remain entirely passive, quietly awaiting a supernatural transformation of the world; those who go about their lives without allusion to the looming End customarily escape notice. Most millenarians conflate the restorative and retributive. They act in some way to assure themselves that the New World will not be unfamiliar. Images of a fortunate future are primed with nostalgia.

A millenarian's sense of time, consequently, is neither strictly cyclical nor linear. However much the millennium is to be the capstone to time, as in Christian and Islamic traditions, it is also in character and affect the return of that carefree era posited for the start of things. However much the millennium is to be an impost between two of the infinite arches of time, as in Aztec and Mahāyāna Buddhist traditions, it is for all mortal purposes a release from pain and chaos for many generations.

To the uninitiated, the millenarian mathematics of time may seem mysteriously scaled: how can one account for that arbitrary algebra that assigns the value 3,500 years to the locution "a time, and times, and half a time" (*Rv.* 12:14)? Millenarian thought is figurative in both senses of that word—metaphorical and numerological. Intricate play with numbers of years is founded upon a faith in the impending aesthetic wholeness of the world-historical process. Millenarian searches for laws of historical correspondence between the individually human and the universally human bear a formal similarity to one another, whether the searchers are nineteenth-century social visionaries (the Saint-Simonian Gustave d'Eichthal, the young Hegelian August von Cieszkowski, the Confucian reformer Kang Yuwei), seventeenth-century theologians (the Puritan chronologist Joseph Mede, the natural philosopher Isaac Newton, the Shī'ī Neoplatonist Muḥammad Sadr al-Dīn), or twelfth-century monastics (the abbess Hildegard of Bingen, the abbot Joachim of Fiore, the White Lotus monk Mao Ziyuan). Each discerns a pattern of historical ages that promises both completion and recapitulation.

World religions have known two deep reservoirs of millenarian thought, one noumenal and Gnostic, the other phenomenal and nomothetic. When the reservoirs empty into

each other—when mathematicians allude to secret knowledge or contemplatives allude to laws of physics (as in fifth-century southern China, seventeenth-century Western Europe, twentieth-century North America)—millenarianism waxes strong. Alchemy and astrology, nuclear physics and molecular genetics share with qabbalistic magic and Tantric yoga an appreciation for techniques of prediction and mutation. Popularly set in sharp contrast to millenarian "fanatics," scientists and mystics have in fact been crucial to the cultural continuity of millenarian thought; they have preserved an intense concern with processes of transformation and the pulsing of time.

Among the world religions we can locate two constellations of millenarian thought about an epochal pulsing of time, one Zoroastrian-Jewish-Greek-Christian, the other Hindu-Buddhist-Daoist-Confucian. In the Mediterranean littoral, an epochal aesthetic was elaborated by scribal elites who were resistant first to Greek rule (thus producing the Jewish *Book of Daniel* and the lost sources for the Mazdean *Apocalypse of Hystaspe*), then to Roman rule (producing the Egyptian *Potter's Prophecy* and Judeo-Christian apocalypses such as *Enoch* and the *Epistle of Barnabas*), and finally to Muslim rule (producing the Syrian-Christian *Revelations of Pseudo-Methodius*). Feasting upon a cosmopolitan diet of Zoroastrian cosmology, Jewish notions of Sabbath, and Greco-Roman ideas of historical recurrence, these literati stamped the disturbing flux of empires with the template of the divine creative week, which they saw being played out again at length in human history through a reassuringly predictable series of world kingdoms over a period of six or seven thousand years. At the end lay a millennial sabbath, transposed from a time of perpetual rest to a time of truce and earthly reward prior to the final onslaughts of the dragon, tyrant, or false messiah.

This demonic figure of imperium acquired a righteous cousin, the Last World Emperor, whose inexplicable abdication would open the way to his black kin. The dialectic between devious shape-changing evil and prematurely vanishing good, played out against a Christian backdrop that placed a redemptive event close to the center of Roman history, gradually reversed epochal theory, which had begun with a fourfold schema of decadence from golden antiquity. The upshot by the fourteenth century was a progressive tripartite schema bounded on one side by fall and flood, on the other by fire and judgment, and aesthetically framed: here a primordial earthly paradise spoiled by a fork-tongued beast; there a climactic earthly paradise spiked by a horned beast, the antichrist. Between these ran three broad historical ages, each with its bright dawn and horrid nightfall. These ages were identified with other trinities (Father-Law-Justice, Son-Faith-Grace, Spirit-Love-Freedom). Over the next centuries, the millennium itself was annexed to the third age and enshrined in historical rhetoric (classical, medieval, renaissance; feudal, capitalist, socialist). Nineteenth-century exponents of infinite progress had only to remove the limiting aesthetic frame.

Across East Asia, a millenarian aesthetic developed within contexts far less adversarial, and we find no figure antiphonal to the universal perfect ruler (the Hindu *cakravartin*, the Buddhist Rudra Cakin, the Javanese hybrid *Ratu Adil*) or to the future incarnate savior (the Hindu Kalkin, the Maitreya Buddha, a reborn Laozi). Furthermore, the epochal scheme was overwhelmingly degenerative: it fixed all recorded history within the last of the four increasingly chaotic eras (*yugas*) of the aeon (*kalpa*). The problem here was not to expand the prophetic horizon but to foreshorten the 4.3 million-year Indian *kalpa* cycle so that hundreds of thousands of distressing years of the fourth era, the *kaliyuga*, did not still lie ahead.

Each *kalpa* was to end in a cosmic disaster that would, after some blank time, initiate a new cycle whose first *yuga* was always a golden age. Strategic foreshortening brought present catastrophe stern to snout with a renewed world. The foreshortening began in northern India with early Mahāyāna Buddhist images of *bodhisattvas*, compassionate enlightened beings who chose to work in this world for the benefit of others rather than withdraw into final *nirvāṇa*. Almost simultaneously, Chinese commentators during the Later Han period (25–220 CE) alloyed the Confucian golden age of antiquity, the Datong, to the Daiping golden age, which according to Daoist sexagenary cycles could be both ancient and imminent, as the Yellow Turban rebels in 184 sincerely hoped. By the sixth century, the colossal four-cycle Indian cosmology had collapsed under the weight of Daoist alchemy, pietist Pure Land Buddhism, and popular Chinese worship of the Eternal Mother (Wusheng Laomu) and the *bodhisattva* Prince Moonlight (Yueguang Tongzi).

There were then three accessible ages, associated cosmologically with the Daoist Former, Middle, and Latter Heavens, typologically with the three Buddhas (Lamplighter, Śākyamuni, and Maitreya), and synecdochically with the Buddhas' lotus thrones of azure, red, and white. Each age begins with a new buddha and then declines, again in triplets: True Doctrine, or Dharma; Counterfeit Doctrine; and Last Days of Doctrine. Since the days of the historical Buddha, Śākyamuni (and, traditionally, of Confucius and Laozi), we have squatted uncomfortably in the dissolute Last Days, awaiting Maitreya or his predecessor, Prince Moonlight, who is due to sweep in at the height of catastrophes one thousand years after Śākyamuni's *parinirvāṇa*. Profitably vague as it was, such a schedule made it clear that Venerable Mother, responsible for sending each of the buddhas, intended our imminent return to the Pure Land, the Western Paradise.

The upshot of this foreshortening was an epochal aesthetic which, by the fourteenth century, called for rounded contours to a humanly proportioned history, and a millenarian White Lotus rebellion, which in 1351 drew the curtain on the Yuan dynasty and set the stage for the Ming (from Ming Wang, the Chinese name for the Manichaean "perfect ruler," the Prince of Radiance). This aesthetic survived to inform the White Lotus uprisings of the eighteenth century, the Taiping Rebellion of 1851 to 1864, the Dao Lanx sect

founded in 1849 by the Vietnamese Buddha Master of Western Peace, Doan Minh Huyen, the Ōmotokyō, founded in 1892, by the Japanese farmer Deguchi Nao, and the Saya San rebellion in Burma from 1930 to 1932.

Stretched between the Mediterranean and East Asian constellations, Manichaeism and Islam transected both. Mani's lithe dualism darkened the antichrist and highlighted the Amitābha (Pure Land) Buddha and the Ming Prince of Radiance. Islam shared with the Mediterranean a demonic end-time imposter, al-Dajjāl, and with East Asia a degenerative epochal theory, but more important was its caravan of redeemers. By 1300, Shī'ī Muslims had at least four candidates for the job of world-renewer: the twelfth spiritual guide, or *imām*, who had disappeared in the ninth century and was in hiding or occultation; a twelfth caliph, under whose reign would appear the restorer of the faith, the Mahdī, to usher in a short golden age before the End; and 'Īsā (Jesus) who would do military honors at the End. Ismā'īlī and Ṣūfī emphasis on the hiddenness of the *imām* may have colored later Christian visions of a Last World Emperor dying (or vanishing) prematurely, and Shī'ī Mahdism certainly splashed across North India and Indonesia. Eventually, *imām*, caliph, and Mahdi merged; in Africa even 'Īsā had joined ranks by the mid-1800s. Two epochal motifs also merged then, a punctual one, according to which a renewer of the faith would appear at the end of each Islamic century, and a symmetrical one, according to which the twelfth *imām* would reappear in the thirteenth century AH (1785/6 to 1881/2 CE), which was a century of worldwide Mahdist movements—northern Nigeria (1804), India (1810, 1828, and 1880), Java (1825), Iran (1844), Algeria (1849, 1860, and 1879), Senegal (1854), and the Sudan (1881).

Common to millenarian aesthetics in all the world religions is this epochal scenario: a calm inaugural and a riotous finale to each act; the circling of two protagonists near the End, one imperial, the other sacramental; and a time at the End that is at once encore, intermezzo, and the throwing open of the doors.

Millenarianism stands therefore in contrast to the modern pessimism that paints miniatures of global devastation yet mounts no panorama of a future marvelous world. Though flood, plague, famine, or war may summon visions of collective death, millenarians promise more than an accurate prediction of catastrophe. They promise an earth lifted beyond safety to grace. Even at their most catastrophic, millenarians insist that a classical tragedy must be fought through only to reach a genuinely good time. From this conviction of drama derive those socially uncompromising rituals of breaking—obscenity, nudity, fasting, celibacy, rebellion—so coincident with millenarian movements. At their most utopian, millenarians tone down the nightmare of the final act: the earth will be transformed by sheer unanimity. Through evangelism, prophecy, and technologies of translation (speaking in tongues, polyglot scriptures, computer mailing), people will, in the face of local despair, embrace the

same faith. A single faith, warmly bespoken, must entail a universal community whose very existence will effect the harmony, sanctity, and security long sought. A time of crisis thus becomes a time of redemption.

Characteristically, millenarians are least specific concerning the millennium itself, a time of instant and perfect communication whose seamlessness makes anatomical detail unnecessary. Millenarians are, rather, diagnosticians of bodies in metastasis. It is hardly coincidental that millenarianism in such diverse contexts as central Africa, western Europe, and northeastern Brazil has been chartered by homeopathic healers, who best appreciate the dramatic working-through of crisis. Not all healers become prophets, but most millenarian prophets claim therapeutic powers that extend from the ailing human body to the ailing body politic. Themselves usually colporteurs of regional symbolic systems, the prophet-healers take millenarianism from diagnosis to prescription, from philosophy to jubilee.

MILLENARIAN MOVEMENTS. If millenarian thought is curled inside calendar scrolls, millenarian movements are engraved on maps. Their rhetoric has to do less with time than with place. Just as millenarian thought focuses upon golden ages, so millenarian movements have golden places: Heaven on Earth, the Pure Land, the Blessed Isle, the Land without Evil, California (this last from a sixteenth-century Spanish romance read by Hernán Cortés). And since in most iconographies what is closest to perfect is closest to the eye of the storm, millenarians are sure that any migration they make is no retreat but a step toward the New World. Millenarian crying of doom and recruitment of the elect must be understood as the epochal duty of taking into the calm center the kernel of humanity.

Prime metaphor of millenarian movements, migration can also become the prime experience, palpable or vicarious. Millenarians encourage those sensations of the migrant that observers may mistake for motives: exile and wandering, put in scriptural tandem with the peripatetic Buddha, the Wandering Jew, the itinerant Jesus, and Muḥammad's Hijrah; nostalgia for lost lands; contrary moods of excited expectation and deep remorse; inflation of the spiritual benefits of transit, sustained by epics of a terrifying, miraculous crossing; ambivalence toward the New World as both brave and strange.

Whether a millenarian group solicits new gods or extorts aid from the old, it will confuse old home with new. Imagery of migration brings into view earlier mythical dislocations (deluge, expulsion) even as it makes evident the need to accommodate to a new land. The more intransigent the notion of home, the more people must provide themselves with apologies for imagined or actual movements away from it, and the more they will tend toward migration as a commanding metaphor.

We know that the English Puritan settlement of "New" England, like the Spanish Franciscan conquest of "New"

Spain, had such millenarian resonance that neither Puritans nor Franciscans were able to acknowledge the historical integrity of the so-called Indians. We know also that for many societies, visitors of a different complexion already had a millenarian role in myths of migration and ancestry (the pink-skinned Europeans for the Fuyughe of the New Guinea highlands, the white-skinned Europeans for the MuKongo of the region of the Kongo, the dark-skinned Mongols, or "Tartars," for western Europeans). For victor as for vanquished, millenarian vertigo has conditioned initial contacts, later misunderstandings, violence, and oppression.

If millenarianism is the religion of the oppressed, it is no less the religion of the oppressor. What prompts the oppressed to envision a new moral order is likely to be the same as what, some decades earlier, prompted the oppressor to move on or over or through. So millenarianism may be both cause and result of migration. This is seen most vividly in the conjunction of Sudanese Mahdism with long-term migration south from an expanding Saharan desert, accelerated pilgrimage across the Sudan to Mecca during the thirteenth century AH, and Egyptian disruption of slave trade from 1850 to 1880.

There is, to many millenarian movements, a primary ecology dependent upon this experience of migration, whether lived or fantasized. Millenarians commonly foresee an End in which the elements of the world are used up, consumed by fire, lava, or flood. As the faithful migrate, the world does too, its elements recombining. How else could that ultimate harmony between the human and the natural be established? Although the elemental reshuffling may be divinely operated, millenarians have typically excited notice by their own human, mimetic acts of violence, their putative disregard for the wealth of the world and the bonds of social life. Cattle killing or pig killing, bonfires of earthly possessions, neglect of crops—these are more than public commitments to prophets or prophecies; they are attempts to act in concert with what seems to be a driving rhythm of history—humanity and nature cracking apart in war and earthquake or crumbling more silently through immorality and faithlessness.

The New World implied by most millenarian movements presumes not only a new natural physiognomy but also a new human physiognomy, one that is messianic in import. We can make no easy distinctions between messianic and millenarian movements. Few messianic leaders appear without heralding an instantaneous New World. Obversely, where there are no focal messianic leaders, as in the Chinese Eight Trigrams Rebellion in 1813, millenarians usually take upon themselves a collective messianic mantle, with cloth enough to redress themselves and the world.

For those who follow prophets toward a New World already marked out—Jan Beuckelzoon's Münster (Germany, 1534), Jemima Wilkinson's Jerusalem (New York, 1788–1794), Antonio Conselheiro's Canudos (Brazil, 1893–1897), Julian Baltasar's Cabaruan (the Philippines, 1897–

1901), Rua Kenana's Maungapohatu (New Guinea, 1907–1916)—the millennium begins in miniature as a sacred prologue. For civic millenarians—the Japanese of Nichiren's Tokaido region in the 1250s, the Italians of Girolamo Savonarola's Florence in the 1490s, the Americans of the 1860s in Emanuel Leutze's mural *Westward the Course of Empire Takes Its Way* in the Capitol, Washington, D.C.,—the burden of pointing the way toward the millennium lies not upon any prophetic enclave or diasporal elite but upon the entire population. The city, the city-state, the state itself becomes the vehicle for world renovation.

So millenarianism may beat at the heart of aggressive nationalism, as in the French revolutionary anthem “La Marseillaise” (1792) or at independence day extravaganzas everywhere. It has underlain beliefs in a Russian mission to redeem civilization, as promoted by the novelist Johann Heinrich Jung-Stilling, the occultist Baroness Barbara Juliane von Krüdener, and Tsar Alexander I before his Holy Alliance of 1815; a Hungarian mission, as in *The Entry of the Magyars*, (1892–1894), a cyclorama celebrating Hungary's “millennial constitution”; a German mission—the Nazi Third Reich; and a Greek mission—the Zoeist Fraternity of the 1950s. Ancient westerly migrations from the Asian steppes by Huns, Magyars, Aryans, and Dorians have thus been roused out of annals, written into history, and gilded to serve as a national mandate. Talk of a “Third World” as the last hope for a failing planet is a contemporary extension of the same civic millenarian ideal.

“First World” scholars tend to link civic millenarianism with modern Christian postmillennial theology, which holds that Jesus' second coming will postdate the start of the millennium, and that no great tumult will intervene between this world and the New World. Millenarians of this type may be told only by their rhythms from the gentler rocking of reformers. In contrast, premillennialists, paradoxically considered both more primitive and more revolutionary, actively prepare for the advent. The New World, inaugurated by Jesus, ruptures the historical chain and affirms the supernal nature of deity. (“Amillennialists,” such as Augustine of Hippo, run the millennium concurrently with the life of the church, so that there can be no separate future earthly kingdom.)

Millenarian movements do not settle conveniently into a pre- or postmillennial stance; even within Latin Christianity, these categories had little bearing before the nineteenth century. From the time of Lucius Lactantius (c. 240–320) until the Reformation, the issue for millenarians was whether the millennium would occur before or after the advent of the antichrist. When early Protestants convinced themselves that the Roman papacy was the antichrist, their heirs had to rephrase the advent debate in terms of the reappearance of Jesus. In the seventeenth century, another generation built up historical arguments in favor of Protestantism by adducing a theory of dispensations through which God progressively revealed divine law. Their heirs mustered courage to

reread the *Book of Daniel* and the *Book of Revelation* as if these books could at last be compassed. Such courage led John Nelson Darby (1800–1882) to lower from the flies a startlingly theatrical machine that inspired many subsequent premillennial scenarios: the “secret rapture,” an unannounced ascension of the living elect while Jesus returns to do battle on the earth below (cf. *1 Thes.* 4:17). Certified by the widely distributed Cyrus Scofield Bible commentary (1909; amended 1919), this machine resembles Hellenistic blueprints of the Gnostic sage's ascent to the lower heavens during world conflagration. Both tend to cloud the supposedly radical thrust of premillennialism.

In larger perspective, it is less useful to distinguish between conservatives and radical millenarians than to note that millenarian movements go through phases: an expansive phase during which believers move out to a ripening world and an astringent phase during which they pull in toward a holy refuge. These phases are equally political. In the stubbornest withdrawal to the most undesirable, inaccessible places (like Jim Jones's village in the Guyanese jungle from 1972 to 1978), millenarians become *prima facie* political threats, whether or not they speak of loyalty to earthly regents. Total withdrawal so often suggests cabal that the more a millenarian group seeks full disengagement, the more the ruling elite may suspect conspiracy and subversion. Similarly, in their expansive phase, millenarians may be the missionary outriders of empire (Christopher Columbus, for example, his monogram qabbalistic, his “Christ-bearing” mission self-consciously prophetic) or the counterforce to empire (the Plains Indian Ghost Dance of the 1880s, the Contestado of Brazil in the 1910s, the New Mexican La Raza movement in the 1960s); they may be the impetus for nationalism (the Tana Bhagat of India, 1915) or the barrier against it (the Watchtower and Kitawala movements in south-central Africa since 1909, Alice Lenshina's Lumpa Church in Zambia in the 1960s); they may be universalists (the International Workers of the World and their general strikes of 1905 to 1920) or ethnic separatists (Juan Santos presenting himself in 1742 as Apu-Inca, descendant of the last Inca, Atahualpa, or the Altai Turks in 1904 awaiting the Oiro Khan's return and freedom from the Russians). Expansive or astringent, millenarian movements are inherently political but not inherently reactionary or revolutionary.

Typologies of millenarian movements. Altogether, as a system of thought and social movement, millenarianism spins on two axes: golden age or new era; primitive paradise or promised land. This oscillation leads perplexed observers to depict millenarian movements as volatile, metamorphic, undirected, and ephemeral. Journalistic or academic, administrative or missiological, works on the subject abound with images that have shaped policy. Millenarianism is described in five iconic sets:

1. a contagion to be quarantined (as with Mormonism in Utah in the later 1800s);
2. a quicksand to be fenced off (as in the legal actions

against the American Shakers in the early 1800s and the present-day anticult campaigns against the Unification Church);

3. a simmering stew to be watched, on the premise that a watched pot never boils (as in police surveillance of the group surrounding Catherine Théot in Paris in 1793 and 1794);
4. a boil to be lanced (as in the English kidnapping of the prophet Birsa from Munda country in northeastern India in 1895 or the Belgian imprisonment of Simon Kimbangu and his first disciples from 1921 to 1957);
5. an explosion to be contained (the German war against the Maji Maji of German East Africa [modern-day Tanzania] in 1905 and 1906 or the Jamaican government's preemption of Rastafarian music and rhetoric).

Millenarianism appears here as an epiphenomenon, a symptom of or a pretext for something more sinister. These images (and policies) have an august history. Church councils in Latin, Byzantine, and Protestant Christianity, legal scholars of Sunnī Islam and rabbinic Judaism, the presiding monks of Buddhist *sanghas*—all have long regarded millenarianism as a disguised attack on codes of behavior that are meant to govern faith and cult. Rulers and their bureaucracies—Confucian, Islamic, Hindu—have regarded millenarianism as a ritual mask worn by crafty rebels.

Present-day typologists are somewhat more sympathetic. For them, millenarianism is emblematic, a ceremonial flag waved furiously over swamps of injustice. Such an interpretation was codified by the French and German Enlightenments, then refurbished by liberals in the nineteenth century until positivist denials of a religious instinct made religion itself seem epiphenomenal. Latter-day social scientists have made millenarianism doubly emblematic, for they describe it as the sign of transition from a religious to a secular society.

Current typologies work along three scales: temporal focus, soteriology, and sociopolitical engagement. On the first scale, typologists range those movements oriented toward (1) the reconstitution of an earlier social structure (called nativist, traditionalist, conservationist, restorative), (2) the imaginative making of peace with change (called acculturative, adjustive, perpetuative, revivalist, reformative), and (3) the creation of an ideal future society (called messianic or utopian). The second scale runs from those movements concerned exclusively with individual salvation (called redemptive, revivalist, thaumaturgic) to those that demand an overhaul of economy and etiquette (called transformative or revolutionary). The third scale starts at total isolation and finishes with collective assault on the state. This scale especially has been plodded and plowed by rhetoric (re-actionary/progressive, passive/active, prepolitical/political, mythological/ideological). Like mule teams, these binary terms are hardworking but perpetually sterile, since millenarians delight in the yoking of opposites.

Dynamic typologies, plotted by such scholars as Mary Douglas (1970), James W. Fernandez, (1964), and Wim M.

J. van Binsbergen (1981), are quadrivalent, balancing social pressures against social structures. Douglas uses two variables, social cohesion and shared symbolic systems. Fernandez takes acculturation as his ordinate, instrumentality as his abscissa. Van Binsbergen considers both the source of disequilibrium (infrastructural, superstructural) and the nature of the threat (“peasantization,” “proletarianization”). Such typologies, more appreciative of the complexity of millenarian movements, still hesitate before the phase shifts through which most movements go.

Motives for the fabrication of typologies may themselves be classified as prophylactic or exploitative. Most typologies mean to be prophylactic. Political scientists, for example, may hope to forestall the rise of charismatic tyranny; anthropologists in colonial settings may want to persuade authorities to handle millenarian movements more reasonably and with less show of force; missionaries may wish to avoid spawning highly independent churches or syncretic cults. Other typologies are exploitative. Marxist and capitalist alike place millenarians on a sociohistorical ladder so as to direct their obvious energies upward, toward national liberation and socialism or toward modern industrialism and oligopoly. Occultists and irenic church people place millenarians on one rung of the ladder of spiritual evolution so as to draw them toward higher consciousness, the Aquarian age, or one broad faith.

Explanations for millenarian movements. Despite the many typologies, there are but two current scholarly explanations for the birth of millenarian movements. The first asserts that millenarianism arises from feelings of relative deprivation in matters of status, wealth, security, or self-esteem. Millenarian movements appear in periods of crisis, when such feelings become most painful. The crisis may be as blatant and acute as the sack of a city or as subtle and prolonged as the passage from isolated agrarian community to industrial megalopolis. Whichever it is, the crisis engenders personal fantasies of invulnerability and escape, which are transformed by charismatic individuals who are often members of displaced elites. These prophets shape public expressions of protest at a time when more straightforward political action seems useless. In the necessarily unsuccessful aftermath, millenarians master the cognitive dissonance between expectation and failure by perpetuating millenarian beliefs within a revised chronology and a new missionary plan. The underlying causes for feelings of deprivation will not have been resolved, so a millenarian tradition, halfway between social banditry and the politics of party, burns on.

The second, complementary explanation says that millenarian movements spring from contact between two cultures when one is technologically far superior to the other. Millenarianism spreads within the settled, inferior culture, whose polity is critically threatened. The newcomers, usually white and literate, disrupt traditional systems of kinship, healing, and land rights. Most wrenching are the factorial economics introduced by the newcomers, whose quantitative

uses of time and money rasp across the qualitative webs of social reciprocity. The indigenes must redefine their notions of power, status, and law, or they must stave off the well-armed traders, their navies, and their missionaries. Acknowledging the superiority of the newcomers' technology but not that of their ethic of possessive individualism, the indigenes begin to speculate about the true origin of the goods and gods of the stingy, secretive newcomers. The result is the contact cult (also called a "crisis cult" or "cargo cult") devoted to frenzied preparation for the receipt of shiploads of goods (cargo) that will dock unaccompanied by whites or in the company of fair-skinned but unselfish ancestors. Already under intense pressure, the people ceremonially destroy sacred objects and standing crops. They believe that this world is ending and a new one must begin, best with the newcomers here and themselves masters of the secret of wealth.

Contact is the sociology for which deprivation is the psychology. Contact leads to millenarianism when one group feels unalterably deprived vis-à-vis a new other. The two explanations, compatible with stock images of eruption and contagion, rely on the premise of a closed system. At the millenarian core lies frustration; out of frustration squirms fantasy, and fantasy breeds violence. Early Freudian analyses of hysteria, psychosis, and schizophrenia have been employed here to wire the circuit between individual fireworks and collective explosion.

Deprivation theories prevail despite decades of criticism for their being slackly predictive. Scholars have noted that relative deprivation does not account specifically for millenarianism; it may as easily induce fracas, sabotage, or personal depression. Conversely, millenarian movements have not "burst out" where relative deprivation has been most apparent: eighteenth-century Ireland, nineteenth-century Ethiopia, the southeastern coast of modern India. Indeed, as critics may add, where across this imperfect world has relative deprivation ever been absent or a crisis lacking?

At this point, theorists invoke a *homo ex machina*, the charismatic prophet who processes the raw stuff of frustration. As a person whose life portends or echoes social crises, the prophet articulates the myth-dream of the people and so becomes invested with the power to direct its expression. Wherever gambols a weak social theory about religious movements, sure to follow is the fleece of charisma. For face-to-face groups, as W. R. Bion showed in his *Experiences in Groups* (New York, 1961), prophetic leaders may embody group fantasies of rebirth. For larger groups—like most millenarian movements—charisma becomes narcotic, a controlled substance rather than a theory of social relations.

Theorists have given particularly short shrift to the remarkable prominence of women as millenarian prophets. In all but Islam and Judaism, women have stridden at the head of millenarian movements, with men as their scribes, publicists, and ideologues. The list is long; a few examples must do: Priscilla and Maximilla of the New Prophecy (the Montanists) in Asia Minor in the late second century; Guglielma

of Milan and her women disciples in the late thirteenth century; Dona Béatrice's Antonine movement in the Lower Congo from 1703 to 1706; Joanna Southcott with perhaps twenty thousand followers in England before her death in 1814; Ellen Gould White, chief oracle of the Seventh-day Adventists in the United States, in the late nineteenth century; Jacobina Maurer of the Brazilian Muckers movement from 1872 to 1898; the visionary Gaidaliu in Assam from 1929 to 1930 and 1961 to 1965; Mai Chaza's Guta ra Jehova (City of Jehovah) in Rhodesia from 1954 to 1960; Kitamura Sayō's Dancing Religion (Tenshō Kōtai Jingukyō) founded in Japan in 1945.

Deprivation theories maintain that women, an injured group, use religion as a means to power otherwise denied them by patriarchies. This makes religion a negative (compensatory) vehicle for women and a positive (creative) vehicle for men, and it fails to explain the power that women gain over men through millenarian movements. There is as yet no sufficient discussion of female charisma. Indeed, where prophetic leadership is male, analysis customarily proceeds from the instrumental, socioeconomic background to doctrine and political tactics; where female, it proceeds from affective, sexual background to ritual and spirit possession. Active men, reactive women: a contact theory of the sexes.

Contact theories are tricky. Amazed by discoveries of previously unknown tribes in the Amazon region and in the Philippines, industrial societies exaggerate the isolation of nonindustrial people. Nonetheless, contact is always a matter of degree: from armies with bulldozers abruptly grading runways in Melanesia to pandemics of smallpox hundreds of miles from (European) vectors. Contact is never so much a shock that some prophecy or other has not already accumulated around a piece of strangeness that years before drifted in on a storm tide or fell from the clouds.

In addition, we have sparse evidence that a number of peoples—the Guaraní of South America, the Karen of Burma, the Lakalai of the island of New Britain, and perhaps the Pacific Northwest Indians—had myths, rituals, and cults whose motifs were millenarian and whose origins were prior to contact with an in-pressing "superior" (Eurasian) culture.

Furthermore, not every uneven contact lights a millenarian "fuse." While the same material imbalance between Europeans and natives faced both Polynesians and Melanesians, millenarian movements have been infrequent among the politically stratified societies of Polynesia. More loosely bunched and socially fluid, Melanesians had inadequate etiquette by which to carry out diplomacy between distinctly separate orders. The customary structure of discourse, not contact itself, seems to have been a key variable in the general absence of cargo cults in Polynesia and their flowering in Melanesia, where consistently powerful Europeans could not be dealt with as easily as could another and analogous order.

At best, deprivation predisposes, contact precipitates. There are six other factors whose presence predisposes to millenarian movements:

1. permeable monastic communities and lay sodalities that extend loyalties beyond the family;
2. itinerant homeopathic healers who carry ritual and rumor across regional borders;
3. a mythopoetic tradition in popular drama and folktale, which makes history prophetic and the people the bearers of prophecy;
4. numerology and astrology, which encourage people habitually to search out relationships between number, event, and time;
5. rituals of inversion, such as carnival or exhaustive mourning, in which endings and beginnings are willfully confused;
6. migration myths that call for the return to an ancestral land or for the return of the dead to a renewed land.

There are negatively prejudicial factors as well. Millenarian movements are least likely at the extremes of the economic spectrum—that is, among those who have complete freedom of mobility and among those absolutely constrained. No millenarian movements occur within groups whose positions are secure, comfortable, and protected by mechanisms of caste (classical North Indian, Japanese, and Roman aristocracies). Nor do millenarian movements occur within groups whose mobility has been severely restricted by political oppression (prisoners, inmates of concentration camps), economic oppression (slaves), physical illness (hospital patients, the starving), or mental illness (asylum inmates, the autistic).

This verges on tautology: millenarian movements happen where physical movement is possible. But the near tautology is suggestive. Where cultural ideals of physical movement differ, so, correspondingly, may the nature of social movements. For example, to be harshly schematic, Western Europeans have stressed vertical, direct, outbound motion in their sports, their dancing, their tools, and their manners; the head and shoulders lead, with the mass of the body in tow. Sub-Saharan Africans such as the Dogon have a kinesthetic of orchestral, highly oppositional, polyrhythmic motion in which the body twists at the hips. The northern Chinese have in their martial arts, their medicine and calligraphy a kinesthetic of sustained circular motion, an integrated body linked to the flow of universal energy. These differences may be expressed in the European proclivity for a tight echelon of prophets leading an undifferentiated millenarian body, the African tendency toward coextensive and fissiparous leadership, the Chinese history of generational continuity from one guiding millenarian family to the next. Kinesthetic differences may also determine the relative importance of the precipitants of millenarianism: where a society looks for whole-body motion, the triggering instances must affect the entire society; where a society looks for articulated or isolated motions, the triggering instances may be more local.

The following four factors recur cross-culturally as major precipitants of millenarian movements:

1. the evangelism of foreign missionaries whose success re-

quires the reordering of native patterns of marriage, family, diet, and calendar;

2. displacement by refugees or invaders, or as a result of persecution, economic decline, or natural calamity;
3. confusion about landholdings due to shifting settlement, the superposition of a new legal grid, or the advent of new technologies, as foreshadowed most particularly by census taking, geological surveys, rail laying, and road building;
4. generational distortion, where the traditional transfer of loyalties and moral authority is profoundly disturbed by war deaths, schooling, long-distance migrations, or urbanization.

These are, of course, related. Threaded throughout are anxieties about inheritance, boundaries, and language (its intelligibility, its capacity for truth-telling). Set within a matrix of predisposing factors, granted some rumors and good weather, these anxieties should specifically engage the wheels of millenarianism, with its special freight of ages, places, and figures of speech. Expansive millenarianism occurs when believers are imperiled or impressed by forces within their society; astringent millenarianism occurs when the forces seem foreign.

Patterns of millenarian movements in world history.

The world's great religions share a larger historical pattern of millenarian activity (although Vedānta Hinduism may be a partial exception). Founded on the fringes of empire or at the fracture line between competing kingdoms, these religions find themselves several centuries later at the center of an empire. Millenarian thought then appears in canonical form, drawing its impetus from those forces of imperial expansion that compel the recalculation of calendars, histories, distances, and sacred geography. The new arithmetic signals a shift in scales of measurement, mediated as much by mystics as by scientists. When an empire seems to have reached its limits, millenarian movements flourish, usually several generations before the dynastic collapse.

When the millennium does not arrive, or when millenarian movements are co-opted by a new dynasty, as in Ming China or Safavid Iran, millenarianism does not fade away. End-of-the-world images linger in the dreams and speech of the people, and end-time ideas are filtered through monasteries, lay brotherhoods, and scientific communities. As these are gradually attracted to the nodes of political power, millenarian movements reappear either as adjuncts of conquest or as resistance to it. Millenarian activity peaks again when the limits of territorial coherence are felt within the empire and along its colonial periphery.

This sequence may obtain for other than the great world religions (e.g., for the Aztec, Iroquois, and Ba-kongo), but materials are lacking that would sustain such an argument for the many preliterate cultures. It is tempting, in the same way that millenarianism itself is tempting, to offer a global explanation—such as climatic cycles—for its rhythms. The

quest for global explanations, however, like the quest for a fountain of youth, tells more about the explorers than it does about the territory.

CONTEMPORARY FASCINATION WITH THE END. Why does millenarianism presently seem in such need of some kind of covering law? The answers to this question have to do with the characteristics of the North Atlantic ecumene, which is responsible for most of the law making.

A first answer is that millenarians tend not to fall within the bell of the ecumene's emotional curve. Although sternly depressed about current affairs, millenarians are at the same time exultant about the prospects for a New World. European and North American psychologists interpret ambivalence as a symptom of inner discord; the greater the ambivalence, the more serious the illness. But "sensible" middle-class citizens join UFO cults, buy fifteen million copies of Hal Lindsey's *The Late Great Planet Earth* (Grand Rapids, Mich., 1970), and order bulk goods from End Time Foods, Inc., in Virginia. Why?

A second answer is that millenarians threaten the stability of the ecumene, upsetting the development of outlying colonies. Millenarians seem haphazardly amused by industrial investment and international tariffs. Why do they keep popping up to make a hash of foreign policy, and why do they prefer the "magical" to the "practical"?

A third answer is that the wars of the twentieth century burned the mark of the beast on North Atlantic arts, philosophy, and history. The beast roared through the no-man's-lands of World War I and the gas chambers and radioactive cinders of World War II. Apocalypse has lost its reference to millennium; it has become simply a synonym for disaster.

We can also trace the growth of a catastrophic mood in North Atlantic science over a century of work in astronomy, cosmology, ecology, climatology, and, recently, morphogenetics and mathematics (the last two united by catastrophe theory, which accounts topologically for instant changes of state). The mood has prevailed in popular science from Henry Adams's 1909 essay on the second law of thermodynamics ("The Rule of Phase Applied to History") to the syzygy scare of the so-called Jupiter effect (1974–1982).

A fourth, more upbeat answer is that archaeology, theology, politics, and the Gregorian calendar have conspired to regenerate the utopian side of millenarianism. Although no millenarian movements and exceedingly few prophecies were geared to the year 1000 (few then used such a calendar), the historical myth persisted because it seemed to many that the year 2000 would be truly millennial. The discovery of the Dead Sea Scrolls since 1947 has underscored the contention, popularized by Albert Schweitzer in 1906, that eschatological hope was vital at the time of apostolic Christianity and should therefore be part of all true Christian belief. Israel's statehood in 1948 and its 1967 reunification of Jerusalem have convinced fundamentalist Christians of the nearness of the Second Coming, for which a principal sign is the

Jews' return to Zion. So we see in the ecumene a telephone hot line for news of the latest scriptural prophecies fulfilled, an international conference on end-of-world prophecies (in Jerusalem in 1971), and a new perfume called Millennium: "In the life of every woman's skin there comes a turning point, a time when her face begins to look older. Now there is an alternative."

Outside the ecumene, detached from Christian dates, Hindu and Buddhist revivalists (Hare Krishna, Divine Light Mission, Sōka Gakkai) preach the last era, the *kaliyuga* or *mappō*. Shī'is awaiting the Mahdi at century's end (AH1399/1979–1980 CE) experienced instead the Iranian revolution. Mexican intellectuals of the Movement of the Reappearance of Anauak, following the Aztec calendar, find this a time of cataclysm. Marxists, flipping through an economic almanac, tear off the leaves of late capitalism.

The fifth answer, then, is that from within and without the ecumene, notions of change have taken on a prepotently millenarian cast.

THE SIGNIFICANCE OF MILLENARIANISM. Claims for the significance of millenarianism, either as a system of thought or as a tradition of social movements, range from the thoughtfully deprecatory (that it is one more index to the predicament of capitalism) to the modestly dismissive (that it is an expression of a universally human fantasy of returning to the womb and resuming unhindered power in a practically timeless world) to the complimentary (that it is a rich mode of dissent where other modes are either unavailable or unavailing) to the genuinely laudatory (that in the form of the myth of the eternal return and its rituals of cosmic renewal, it is the taproot of religion and revolution). The truth, as usual, lies athwart.

BIBLIOGRAPHY

Millenarian scholarship, chiefly a phenomenon of the North Atlantic ecumene, has followed the same patterns of historical change.

During the sixteenth century, while European merchants redefined time as fortune, millenarians appeared in Roman Catholic histories of heresy and Protestant martyrologies. For Catholics and for the Magisterial Reformers, millenarianism was occasioned by lust (impatience, appetite without love); for radical Protestants, millenarianism came of a desperately loving desire to return to the apostolic model. Then, as today, the bell cows of any overview were the communalistic Taborites in fifteenth-century Bohemia, Thomas Müntzer's rebels in the German Peasants' Revolt of 1524–1525, and the antinomian Anabaptist kingdom at Münster in 1534. In these three episodes the consequences of the millenarian program were so played out that most subsequent commentaries used them to distinguish between legitimate and illegitimate visions of religious and social renewal.

Early seventeenth-century histories, written in a confusing era of religious warfare, tended to describe millenarianism as the confused or gangrenous extension of piety, for which in En-

English was coined the word *enthusiasm*, an outlier of the syndrome of melancholia. Melancholics seemed to resemble the age itself, mixing categories and muddling the practical, the extravagant, and the fantastic.

After the near revolutions of midcentury—the French Fronde with its *illuminés*, the English Civil War with its Levellers and Fifth Monarchists—millenarianism was implicated in political plotting and secret communication. So the medical figure of contagion, used earlier against witchcraft, was resurrected in works about millenarians, who might be possessed or mad or deluded but were likely first to have been infected by conniving knaves. Every one of these explanations was offered for the mass appeal of the great Jewish false messiah, Shabbetai Tsevi, who in 1666, at the height of his career, converted to Islam under penalty of death.

Eighteenth-century accounts, although sometimes pietist and sympathetic to millenarians, moved toward a vaguely biological description: millenarianism was seen as corpuscular, nervous, iatromechanical. In an era of newly accurate clocks and mortality statistics, historical source-criticism and the propaganda of Newtonian science, millenarians seemed to have lost their sense of time and power of memory.

Most modern assumptions about millenarianism were in place soon after the French Revolution. Encyclopedias of religion and dictionaries of sects sank the stakes: millenarianism was a personal reaction to internal chemical imbalance or to feelings of envy or lust; it was a social ploy or a disguise for politicking, money making, or ambition. Later in the century, under the impact of revivalism and labor agitation, millenarianism became part of the sociology of crowds; as a personal disorder it was associated homologically with *dementia praecox* (soon to be called schizophrenia). Anthropologists worked with Europocentric genetic metaphors: if millenarian movements occurred within Western civilization, they were classified as throwbacks to the spiritual childhood of religion; if outside, they were seen as infantile tantrums of primitive societies.

At least three thousand studies of millenarianism have been printed in this century, more and more often with a sympathetic preamble. Even so, because millenarians seem destined to inevitable disappointment, people of all political persuasions have resented the millenarian label, none more so than revolutionaries who want to make it clear that their programs for a New World are neither illusory nor doomed. Since Ernst Bloch's *Thomas Müntzer als Theologe der Revolution* (Munich, 1921), millenarian scholarship has been especially sharpened by political as well as religious polemic.

At midcentury, out tumbled a spate of works insisting on the centrality and continuity of millenarianism: for European culture, Normal R. C. Cohn's *The Pursuit of the Millennium* (1957), 3 ed. (New York, 1970); for peasant culture, Eric J. Hobsbawm's *Primitive Rebels* (New York, 1959); for world culture, *La table ronde's* full issue on "Apocalypse et idée de fin des temps" (no. 110, February 1957); and the human condition, Mircea Eliade's *Cosmos and History: The Myth of the Eternal Return* (New York, 1954). Simultaneously, in *When Prophecy Fails* (1956; reprint, New York, 1964), Leon Festinger, Henry W. Riecken, and Stanley Schachter developed a theory of cognitive dissonance to explain the endurance of millenarian beliefs from the point of view of social

psychology. The capstone was a conference in 1960 sponsored by *Comparative Studies in Society and History* (The Hague, 1958–), the journal that is still the most active in millenarian studies. The event set the agenda for at least a decade of research, prompting scholars to fashion typologies and to formulate distinctions between varieties of millenarian activity. The conference results were published in book form in *Millennial Dreams in Action: Essays in Comparative Study*, edited by Sylvia L. Thrupp (The Hague, 1962).

Although the works discussed above remain the most consistently cited sources in millenarian studies, their popularity is largely a measure of the comfort they have afforded a North Atlantic ecumene that is increasingly upset by liberation movements and cold war apocalypse diplomacy. Millenarianism, they assure us, has a history, a tradition, a phenomenology, a philosophy, and a psychology.

Henri Desroche's *Dieux d'hommes: Dictionnaire des messianismes et millénarismes de l'ère chrétienne* (Paris, 1969), although incomplete and outdated, codified much earlier scholarship. That year also saw a general turn away from theories of social pathology and mental illness to explain millenarian movements. Sophisticated analysis has turned toward the creative and polysemous nature of millenarianism. The following are some of the most thoughtful and evocative works published in English since 1969.

The oxymorons of millenarian thought have been deftly handled by Marjorie E. Reeves in *The Influence of Prophecy in the Later Middle Ages: A Study of Joachimism* (Oxford, 1969) and *Joachim of Fiore and the Prophetic Future* (London, 1976), which should be supplemented by a series of articles by Robert E. Lerner, including "Medieval Prophecy and Religious Dissent," *Past and Present* 72 (1976): 3–24; J. G. A. Pocock's *Politics, Language and Time* (New York, 1971), especially his essay "Time, History and Eschatology in the Thought of Thomas Hobbes," pp. 148–201; and Sacvan Bercovitch's *The Puritan Origins of the American Self* (London, 1975), which is excellently extended in his article "The Typology of America's Mission," *American Quarterly* 30 (Summer 1978): 135–155. Theodore Olson's *Millennialism, Utopianism, and Progress* (Toronto, 1981) moves heroically from the Greeks to the present, slipping and sliding along the way but always serious and sometimes passionate. Joseph Needham's purview is even broader; Needham masterfully draws out the similarities as well as the differences between European and Chinese approaches to time, in "Time and Eastern Man" in his *The Grand Titration: Science and Society in East and West* (Buffalo, N.Y., 1969), pp. 218–298. Like Needham, Charles Webster underlines the philosophical but also the social relations between science and millenarianism in his *The Great Instauration: Science, Medicine and Reform, 1626–1660* (New York, 1976).

Social anthropologists have been at the forefront of theory about millenarian movements. Alluded to in the text were Mary Douglas's *Natural Symbols: Explorations in Cosmology* (New York, 1970); James W. Fernandez's "African Religious Movements," *Annual Review of Anthropology* 7 (1978): 195–234, and "African Religious Movements: Types and Dynamics," *Journal of Modern African Studies* 2 (1964): 531–549; and Wim M. J. van Binsbergen's *Religious Change in Zambia* (Boston, 1981). Highly influential for his sophistication and

for his theory of differential access to redemptive media is Kenelm Burridge's *New Heaven, New Earth* (New York, 1969). An interesting and thoroughgoing Marxist approach is presented by Berta I. Sharevskaya in *The Religious Traditions of Tropical Africa in Contemporary Focus* (Budapest, 1973); more accessible may be her article "Toward a Typology of Anticolonial Religious-Political Movements in Tropical Africa," *Soviet Anthropology and Archaeology* 15 (1976): 84–102. Less anthropological but nicely eclectic is Stephen Sharot's *Messianism, Mysticism, and Magic: A Sociological Analysis of Jewish Religious Movements* (Chapel Hill, N.C., 1982).

For particularly well done case studies of millenarian movements, see Mangol Bayat's *Mysticism and Dissent: Socioreligious Thought in Qajar Iran* (Syracuse, N.Y. 1982); Pierre Clastres's *Society against the State*, translated by Robert Harley and Abe Stein (New York, 1977), concerning the Guarani of South America; Hue-Tam Ho Tai's *Millenarianism and Peasant Politics in Vietnam* (Cambridge, Mass., and London, 1983); Susan Naquin's *Millenarian Rebellion in China: The Eight Trigrams Uprising of 1813* (New Haven and London, 1976) and *Shantung Rebellion: The Wang Lun Uprising of 1774* (New Haven, 1981); my own *The French Prophets: The History of a Millenarian Group in Eighteenth-Century England* (Berkeley, 1980); and Anthony F. C. Wallace's *The Death and Rebirth of the Seneca* (New York, 1972).

Further bibliographies may be found in my "The End of the Beginning: Millenarian Studies, 1969–1975," *Religious Studies Review* 2 (July 1976): 1–15; Harold W. Turner's *Bibliography of New Religious Movements in Primal Societies*, 4 vols. (Boston, 1977–); and Bryan R. Wilson's *Magic and the Millennium* (New York, 1973), pp. 505–531.

MILLENARIANISM: CHINESE MILLENARIAN MOVEMENTS

The yearning for a utopia where one is free from want and where peace and prosperity reign supreme has been very much an integral part of Chinese religion since pre-Qin times (before 221 BCE). Confucius (551–479 BCE) maintained the notion of a golden age when Sage-Kings such as Yao and Shun reigned effortlessly in perfect harmony. Laozi also espoused the idea of small agricultural communities where life was simple and government was noninterfering. The Moist concept of undifferentiated and nondiscriminating love was expressed in the form of *datong* ("grand unity" or "great equality"), which had been incorporated into the Confucian text *Liji* (The classic of rites). However, all these utopian states were understood to have existed in the distant past. As time progressed, the conceptualization of utopia became more concrete and contemporary. During the Qin-Han period (221 BCE–220 CE), mysterious lands in the extreme east and west of China were regarded either as paradises inhabited by immortals, or as idealized countries where justice and honesty prevailed. The realm of Xiwangmu or Queen Mother of the West, on Mount Kunlun in the west and the three fairy islands of Penglai ("proliferating weeds"), Fangzhang ("square fathom"), and Yingzhou ("ocean continent") in the eastern seas belonged to the first category, while the land of "Great Qin" (Da Qin), an idealized version of the Roman Empire, belonged to the second.

In contrast to pre-Qin utopias, all these ideal realms were understood to be contemporaneous with those who visited or reported on them. However, they were accessible to only a few privileged members of society. The Queen Mother of the West, for example, entertained only emperors and regaled them by her turquoise pond with her peaches and wine of immortality. The three fairy islands were similarly inaccessible to ordinary mortals; they either sank into the ocean when approached, or caused big storms to drive people off course.

EARLY MOVEMENTS. Two major soteriological movements developed in China in the second century of the common era. Both had appeal to the masses. The first, centered in western China (present-day Sichuan and Shaanxi), was headed by Zhang Lu, who created a theocratic state between 186 and 216 CE. Tracing his teaching to his grandfather Zhang Daoling (34?–156? CE), Zhang Lu taught that illness was a sign of sin and could be healed by confession. Furthermore, he advocated the establishment of communal facilities to expedite the realization of his utopia on earth. These facilities provided free food for the needy and undertook all kinds of public works for the good of the commonweal. Zhang's movement, known as the Five Pecks of Rice (Wudoumi) or Way of Celestial Masters (Tianshi dao), survived the Han-Wei dynastic transition because of his accommodation with political authorities. It became the recognized orthodox Daoist tradition in China, and Zhang Daoling was revered as the first Daoist patriarch.

There was another religious movement in eastern China that, under the leadership of Zhang Jue (d. 184 CE), existed contemporaneously with Zhang Lu's and in many ways resembled the latter in both belief and organization. It was called the Way of Highest Peace (Taiping dao) because of its alleged subscription to the text *Taiping jing* (Classic of highest peace). However, it differed from Zhang Lu's movement in that it rebelled in 184 and was ruthlessly crushed by the Han imperial forces. This rebellion, known as the Yellow Turban Rebellion because of the color of the headgear worn by the rebels, represented the first large-scale religiously inspired rebellious movement in Chinese history.

Some scholars argue that the impetus for the militancy of the Yellow Turbans came from the *Taiping jing* which, despite its Confucian and perhaps even Buddhist borrowings, was obviously a Daoist text concerned with eschatology and changing the course of history. Compiled in the form of a continuing dialogue between the Celestial Master, an emissary of Dao, and his disciples, the *Taiping jing* offers description of an ideal society and provides expectation of a renewal of the world through heavenly agents. The significance of the text's eschatology lies in the fact that it relativizes the validity of the existing society. It sees drastic change in the course of history as imminent and desirable, for the demarcation between this world and the beyond will be broken down, and the dawning of a mystical new order will be at hand.

Thus, from the original view of an ideal world existing in the remote past, through the transitional view of the utopia existing in distant lands contemporaneously, Chinese religion finally came to the view of the perfect realm existing in the future, the arrival of which would signal the end of the present age.

THE MEDIEVAL PERIOD. The several centuries after the collapse of the Han dynasty were a time of burning religious zeal, caused in part by the people's desire to seek solace from a rapidly disintegrating society brought about by "barbarian" invasions and incessant warfare. With Confucianism in eclipse, both Daoism and the newly introduced Buddhism made great inroads into the hearts and minds of the Chinese. Especially attractive to the suffering masses was the promise of messianic deliverance offered by both Daoist and Buddhist sectarian groups. It was during this time, specifically from the fourth century on, that a Chinese-style millenarianism developed, complete with the identification of an eschatological crisis, the appearance of a messianic figure, the apocalyptic battle, the guaranteed survival of the elect, and the portrayal of the "New Jerusalem."

In sectarian Daoism, millenarianism was expressed in the cult of Laozi, which now assumed the name of Li Hong the Perfect Lord. Between the fourth and the fifth centuries numerous rebel leaders, claiming to be incarnations of Li Hong, staged uprisings. As described in the *Dongyuan shen-zhou jing* (Classic of divine spells from the deep cavern), a Daoist text compiled in the early fifth century, the millenarianism of the Li Hong cult contains the following themes:

1. There is an impending crisis of cosmic proportions caused by the accumulation of evil. The time of reckoning will be the year *renchen* (which occurs once every sixty years in the Chinese calendar, but was generally understood to specify the year 392 CE), when floods surging upwards of several thousand feet and epidemics of every imaginable kind will afflict the world.
2. The savior Li Hong will appear to deliver his believers from this cataclysmic disaster and to eradicate all nonbelievers, who will be discarded as chaff. This apocalyptic battle will result in the total triumph of Li Hong and his chosen ones.
3. An era of unutterable joy and peace will ensue. The ravages of war will be eliminated. The cosmos will be reconstituted. The entire earth will be covered with seven treasures. One sowing will yield nine crops and human lifespan will be extended to three thousand years, after which it will be renewed again. All men and women will be sages and evil people will no longer exist.

This Daoist millenarianism was paralleled by a Buddhist version of the same period. Centered around the messianic figure of "Prince Moonlight" (Yueguang tongzi), a minor character in the legendary biography of the Buddha, this Buddhist millenarianism has essentially all the features of its Daoist counterpart, with the same expectation of apocalyptic happenings designated to take place in a specific year. In fact, the similarity between the two versions of millenarianism is so striking that one is compelled to assume that Daoism and Buddhism must have overlapped or merged together at the popular level during their parallel development at this time.

Prince Moonlight was later superseded by a much more powerful and famous Buddhist savior—the Buddha Maitreya. In Buddhist mythology, Maitreya was the Buddha who "has yet to come." He was believed to dwell in the Tusita heaven, waiting to descend to earth to save all believers. There is the further understanding that when he arrives the world will be experiencing the last days of the Buddhist *dharma* (an age known as the *mofa*), and that with one bold stroke he will rid the world of all evil elements and usher in a new golden age. The Maitreya Buddha was thus perceived as a savior, as his coming would signal the end of existing misery and injustice. Unlike Amitābha Buddha, who promised salvation in the form of rebirth in his Pure Land and made no attempt to improve this world, the Maitreya Buddha served as a world redeemer who would radically and dramatically change the status quo and transform the world into a realm of bliss and abundance. What made Maitreya worship even more subversive was the belief, pervasive since the fifth century, that his coming was imminent (rather than in the distant future as originally believed). This immediately turned him into a symbol for numerous antidynastic movements, all of which aimed at the speedy toppling of the existing order.

In addition to Daoist Li Hong and Buddhist Maitreya, there was yet another millenarian tradition in medieval

China—Manichaeism. Originally introduced from Persia during the early Tang dynasty (618–907), Manichaeism subscribed to a dualistic view of the world wherein the forces of Light, under the leadership of Mani, would engage in a fierce struggle with the forces of Darkness. Followers of this tradition held the belief that cosmic history progressed in three stages: the first stage characterized by a clear division between the realms of Light and Darkness, the second by a blurring of this division that resulted in the struggle between the two, and the third by the ultimate triumph of Light over Darkness and the creation of a realm of everlasting peace. Believing themselves to be living near the end of the second stage, followers of Mani led a pure and puritanical life in order to guarantee victory over the forces of Darkness and evil. They practiced strict vegetarianism, refused to worship spirits, ghosts, and even ancestors, and buried their dead naked. Indeed their vegetarian diet had become such a distinguishing feature that they were pejoratively referred to as “vegetable eaters and devil (Mani) worshippers” (*chicai shim*). Their antinomian values, demonstrated by such practices as naked burial and nonobservance of ancestral rites, earned them further suspicion from the authorities.

THE LATE IMPERIAL PERIOD. All the above-mentioned millenarian traditions interacted with one another as they evolved. By the fourteenth century, such a substantial merger had taken place among them that they were collectively known as the White Lotus, a catchall label used by the government to encompass most of the proscribed millenarian groups, all of which had their own respective names. In fact, White Lotus had a very distinguished beginning. It was allegedly the name of a lay Buddhist group organized in 402 by the eminent monk Huiyuan to worship the Buddha Amitābha. Later, the Pure Land master Mao Ziyuan (1086–1166) also used this name to designate his pious vegetarian group. In any event, White Lotus had obviously metamorphosed into a millenarian sectarian movement under the leadership of Han Shantong (d. 1355) toward the end of the Yuan dynasty (1206–1368). Combining Maitreyan with Manichaean elements, Han boldly declared the “incarnation of Maitreya Buddha and the birth of the Manichaean Prince of Light.” Although he was captured and executed, Han was the symbol of the religious movement that eventually brought an end to the Yuan regime.

During the ensuing Ming dynasty (1368–1644) (some scholars even argue that the very name *Ming*, which means “light,” is indicative of the Manichaean influence on the founder of the dynasty), the folk sectarian tradition generally labeled by the government as White Lotus became even more systematized. Central to this mature sectarian belief was the notion of Wusheng laomu, or the Eternal Mother, who, as progenitor of the human race, had vowed to save all her repentant children from certain demise. She would deliver them to the *zhenkong jiaxiang* (“native land of true emptiness”) where they would enjoy peace and affluence forever. This dual concept of the Eternal Mother and her Native Land of True Emptiness became the identifying creed of

these late imperial Chinese sectarians. It served as a profession of faith and a powerful bond that drew all the sect members together into one big religious family. This concept also enabled them to relativize their attachment to their earthly parents and their native communities, and allowed them to see that this world was not the best of all possible worlds, that a “new beginning” would arrive in time to replace the existing order, and that this new beginning would sit in judgment over the entire past.

Like the Manichaeans before them, the Ming-Qing sectarian believers maintained that time progressed in three major epochs: the age of the Lamplighting Buddha of the past, the age of the Śākyamuni Buddha of the present, and the age of the Maitreya Buddha of the future. Crucial to this time scheme was the expectation that the third or future age was imminent, to be ushered in by an apocalyptic conflagration that would scourge the world to remove all evil elements. (Some sects used the epithets Blue Sun, Red Sun, and White Sun to represent the respective ages.) This cataclysmic turning point was known as the kalpic transition (*jie*), characterized by floods, epidemics, earthquakes, and all kinds of unspeakable disasters during which the whole cosmic order would be torn asunder and the elect and the doomed would be separated. When the Maitreya Buddha finally appeared as the messenger of the Eternal Mother to deliver the surviving faithful, the world would be reconstructed and the reunion between the Mother and her lost children would take place. The saved would enjoy the new order, which, according to the description of the *baojuan* (“precious scrolls”)—a special genre of religious tracts compiled by the sectarians in profusion during the sixteenth and seventeenth centuries—would be peaceful, immortal, and egalitarian.

Because of this millenarian and antinomian orientation of the sectarians, they were feared and ruthlessly persecuted by successive dynasties. Their very expectation of the advent of the third age was a negation of the present age, thus undermining the authority as well as the legitimacy of the existing regime. As it turned out, this obsession with salvation in the future age did occasionally inspire ambitious individuals within the sects to proclaim the descent of the Maitreya Buddha and to raise the banner of rebellion in an attempt to usher in the third age. To be sure, the correlation between millenarianism and rebellion was never a direct one, yet the government was always suspicious of millenarians, who, it had reason to fear, were not averse to using violence in order to hasten the end of the present age. There was only a fine line separating the anticipation of the kalpa from the expedition of its arrival. Given the fact that the leaders of these sectarian groups were often uprooted, restless, and disgruntled elements in society, this official apprehension is understandable.

Suspicion was further reinforced by the vicarious sibling relationship of the sect members, which undermined the Confucian emphasis on blood ties, as well as the relative equality of the sexes within the sectarian group, flouting the

orthodox insistence on strict sexual distinctions. Sectarian organization itself, though lacking centralization, was nevertheless capable of forming large-scale regional networks in a short time because of shared beliefs among the majority of the sects. Quite often, different groups in different geographic areas would subscribe to the same precious scrolls, thus espousing the same doctrines. Many of these tracts had been handed down through generations of sect leaders, allowing the creation of a hereditary folk religious elite. Notable groups such as the Dacheng sect of Wang Sen (d. 1619) maintained an uninterrupted hereditary transmission for at least two centuries. This resilience of the sects was a great source of worry for the government.

THE TAIPING REBELLION. The most famous and spectacular millenarian movement in traditional China was, of course, the Taiping Rebellion (1850–1864) led by Hong Xiuquan (1813–1864). Hong was a frustrated examination candidate who had received Christian literature from a Chinese convert. With that minimal exposure, he wove together a religion that was a mixture of traditional Chinese eschatology and Christian salvationism. He also organized the God-Worshippers Society, which, reacting to ethnic tensions and prompted by Hong's own sense of mission, rebelled in 1850.

Hong Xiuquan's religion is best understood through the designation he chose for his movement after 1850. He named it Taiping tianguo ("heavenly kingdom of highest peace"). Taiping, it should be recalled, was the ideal of the Yellow Turbans who rebelled in 184, and had inspired various millenarian groups throughout Chinese history. *Tianguo* was derived from the Judeo-Christian notion of God's kingdom. Together, the two compound terms indicate Hong's unshakable faith that God's kingdom, in the form of Highest Peace, could be realized on earth, and that he himself would be the instrument through which this momentous task would be accomplished. Declaring himself to be the second son of God and the younger brother of Jesus, Hong saw himself as the redeemer of China, if not of the world as well. At once anti-Confucian and anti-Manchu, his brand of messianic salvationism was by far the most radical China ever witnessed.

Hong's Heavenly Kingdom was characterized by the proclaimed equality of all men and the liberation of all women. To be sure, there was the inevitable discrepancy between theory and practice. Yet this Taiping ideal was unequivocally enunciated and applied to concrete situations in the form of policy promulgations such as the land tenure system. This system provided equitable land redistribution, going so far as to observe no distinction between the sexes in land allotment.

When the Taiping army captured the city of Nanjing in 1853, Hong made it his Heavenly Capital. Nanjing, scene of the signing of the treaty that concluded the Opium War between China and Great Britain only eleven years earlier, was seen by Hong as the "New Jerusalem" promised in the *Book of Revelation*. But internal strife, coupled with Manchu

military reforms and growing Western hostility toward the Taipings, finally resulted in their crushing defeat in 1864.

Chinese millenarianism can thus be seen having a history that goes back to the early medieval period. It can still be detected among certain religious groups on the mainland, in Taiwan, and in Southeast Asia. It has exerted its greatest appeal among marginal or peripheral members of society who, though not necessarily economically deprived, were denied access to power and prestige in the orthodox world. Through mutual aid and group solidarity these people were able to gain self-respect and a sense of worth from their affiliation with sectarian organizations. The charismatic and talented among them might even achieve positions of power and influence within the sect. This was particularly true of women, who were otherwise totally barred from meaningful contacts outside of their families. Ethically relativistic because of their orientation toward the future millennium, members of these movements often invited the wrath and oppression of the authorities. They interpreted times of economic distress, social turmoil, and natural disasters as signals of the advent of the third age, an age when they would emerge triumphant in their combat against exploitation and injustice, as well as against death itself. They therefore became agitated and expectant, if not openly rebellious, and always potentially subversive. Their antinomian values and behavior posed a direct challenge to the orthodox tradition, while their millennial yearning to build a better world often implied their rejection of the present one. In a certain sense, twentieth-century Chinese revolutionaries, including the Communists, operated much in the same mode as the earlier millenarian sectarians in their attempt to change the world.

RICHARD SHEK (1987 AND 2005)

MĪMĀMSĀ. The word *mīmāṃsā* means "investigation" in ordinary Sanskrit. Since the term is applied to an important South Asian philosophical school, it must originally have meant "the investigation of the proper interpretation of the Vedic texts." The Mīmāṃsā school is thus better known as the Purva-mīmāṃsā school, which is sometimes called the Dharma-mīmāṃsā (inquiry into the nature of *dharma* as laid down by the Vedas, the supreme authority). Uttara-mīmāṃsā is the descriptive name for the Vedānta school, which deals with the nature of *brahman* as laid down in the latter part (*uttara*) of the Vedas, and in the Upaniṣads, hence also called Brahma-mīmāṃsā (inquiry into the nature of *brahman*). The word *dharma* is of prime importance in this context. It stands here for one's "duty" (*codanā*) enjoined by the Vedas, which includes both the religious or sacred duties or actions and the moral duties as well. *Dharma* also denotes the "virtue" attainable by performing such duties or following such courses of actions. Thus *dharma* is the main topic for discussion in the Mīmāṃsā school.

The Vedic scriptures were seriously attacked by the Śramaṇas (mendicant Brahmanic philosophers) about 500 BCE, and as a result its authority was apparently being devastated by criticisms. Hence the Mīmāṃsā school originated among the Vedic priests who wanted to reestablish this authority by resolving the apparent contradictions and other

textual problems found in the Vedic scriptures. The Mīmāṃsā school in this way developed the science of exegesis. A *Mīmāṃsā Sūtra* was compiled as early as the first century BCE, and it was ascribed to an ancient sage, Jaimini. It is regarded as the key text of the school.

Regarding *dharma*, Mīmāṃsā maintains a form of fundamentalism. It claims that the scriptures are the only means of knowing what is *dharma* and what is not. Only by following the injunctions of the scriptures can we attain *dharma*, or the "good," that cannot be attained by any other means. Other means of knowledge (perception, inference, reasoning, etc.) are of no help in the realm of *dharma*, for concerns of *dharma* are with transcendental matters, the imperceptibles and the unverifiables, such as the afterlife, heaven, and the moral order. Hence the Mīmāṃsā school defines the essence of the Vedas (*vedatā*) as that which informs us about such a transcendental realm. And the authority of the Vedas in such matters is self-evident. The truth of the scriptural statements is self-validating. The Vedas are to be regarded as eternal and uncreated. The scriptures are *revealed* texts, there being no author of them. In short, the truths of the Vedas are transempirical, hence no empirical evidence can conceivably bear on them.

The problem of interpretation has led the Mīmāṃsā school to the study and discussion of topics which are of great philosophical interest. The Mīmāṃsā developed itself into a kind of philosophical discipline, incorporating into it a theory of knowledge, epistemology, logic, a theory of meaning and language, and a realistic metaphysics. With its emphasis on the philosophy of language and linguistics, the Mīmāṃsā has sometimes been called the *vākya-śāstra* ("theory of speech"). It also formulated various rules of interpretation in order to resolve and eliminate the apparent inconsistencies of the scriptural texts.

Later on, the Mīmāṃsā school was divided into two subschools (c. 600–700 CE), following the two important exponents of the school, Kumārila Bhaṭṭa and Prābhākara. They are called the Bhāṭṭa school and the Prābhākara school. Of the many minor differences between the two subschools, only a few of the more notable ones have been noted here.

Kumārila speaks of six *pramāṇas* ("legitimate ways of knowing")—perception (*pratyakṣa*), inference (*anumāna*), verbal testimony (*śabda* or *aptāvacanā*), comparison (*upamāna*), presumption (*arthāpatti*), and nonapprehension (*anupalabdhi*). Prābhākara accepts the first five only. Since he rejects "absence" (*abhāva*) as a separate reality, as a "knowable" entity (*prameya*), he does not need "nonapprehension" to establish such entities. For the Bhāṭṭas, a cognition is not a perceptible property, but it is inferred from the "cognizedness" (*jñātatā*) of the object cognized: since this pot is cognized by me, a cognition of it must have occurred in me. For the Prābhākaras, a cognition is self-cognized—it perceives itself. But both regard knowledge to be self-validating. Kumārila admits both Vedic and non-Vedic *śabda* (sentences, speech) to be *pramāṇa*. Prābhākara holds that real

śabda-pramāṇa is the Vedic *śabda*. Both try to establish the Vedic authority not on God but on such transcendental reality as *dharma* and *mokṣa*. The Bhāṭṭas explicitly hold the *jñāna-karma-samuccaya-vāda*, that both knowledge and action lead to liberation. The Prābhākara view does not seem to be very different.

The two subschools differ in their views about the correct incentive for man's action (which includes both moral and religious acts). The Prābhākaras say that it is only the sense of duty while the Bhāṭṭas argue that both sense of duty and the desire for benefit constitute the correct incentive for action. On another rather technical matter, the two disagree. The Bhāṭṭas believe that the sentences get their meanings from their atomistic constituents, the individual word-meanings, while the Prābhākaras believe that the words directly constitute the sentence-meaning as a whole only insofar as they are syntactically connected (*anvīta*) with other words in the sentence.

NEUROEPISTEMOLOGY

MINERVA, a Roman goddess, was the protector of intellectual and manual skills. The oldest form of her name, *Menerva*, may derive from the Indo-European root **men-*, which is expressive of mental processes. Various Etruscan transcriptions of the name, though earlier attested than any Italic form, probably should be regarded as borrowed from the Latin.

Minerva appears neither in the so-called Numan calendar, which registers the oldest public festivals in Rome, nor

in connection with a priesthood. Her first occurrence is with Jupiter and Juno as a member of the divine triad that was worshiped on the Capitoline Hill in Etruscan-ruled Rome at the end of the sixth century BCE. Archaeological findings in Santa Marinella and Veii-Portonaccio bear witness to a contemporaneous cult of Minerva in southern Etruria.

Images of the goddess show many features of the Greek Athena: helmet, shield, spear, and aegis stamped with the likeness of a Gorgon. Recent discoveries in Pratica di Mare (the ancient Lavinium) show that the influence of Greek art did not exert itself exclusively through the Etruscan medium. The mythological episodes that were selected in Italy represent the goddess as a patroness of warlike heroes and gods (especially Herakles and Mars) and as a palladium (a token of invincibility).

Minerva was worshiped throughout Italy and on several Roman hills: with Jupiter and Juno on the Capitoline and the Quirinal and alone on the Aventine. There were also sanctuaries of the "captive Minerva" (brought from Falerii in 241 BCE) on the Caelius and of Minerva as patroness of physicians on the Esquiline. The emperor Domitian (81–96 CE), a prominent votary of the goddess, increased the number of her cult places.

Minerva was the special patroness of craftsmen, and at least from the time of Augustus (27 BCE–14 CE) craftsmen attended the festival of the Quinquatrus (March 19–23). The festival was publicly solemnized by gladiatorial exhibitions and included a *tubilustrium* (a ritual purification of war trumpets), further evidence of a link with Mars and war. Flute players celebrated a festival of their own ("little Quinquatrus") on June 13.

The cult of Minerva, supported by the municipal institution of capitols (imitations of the Roman temple of the Capitoline triad) and the devotion of craftsmen and soldiers, diffused widely throughout the Roman Empire until the beginning of the common era.

BIBLIOGRAPHY

Articles in three classical encyclopedias provide detailed and cautiously interpretative views of the subject: Franz Altheim's "Minerva," in *Real-Encyclopädie der klassischen Altertumswissenschaft* (Stuttgart, 1932); Filippo Coarelli's "Minerva," in *Enciclopedia dell'arte antica* (Rome, 1963); and Konrat Ziegler's "Minerva," in *Der kleine Pauly: Lexicon der Antike* (Stuttgart, 1969). The most recent discoveries are commented on by Ambros J. Pfiffig in *Ein Opfergelübde an die etruskische Minerva* (Vienna, 1968), for Santa Marinella, and by F. Castagnoli in *Il culto di Minerva a Lavinium*, "Problemi attuali di scienza e di cultura," no. 246 (Rome, 1979), for Pratica di Mare.

MINISTRY. The term *ministry* traditionally refers to offices of leadership in the Christian church, but there has been a growing recognition that it also describes the way the mission of the whole church is conducted. Both in terms of specific offices (ministers) and in terms of the work of the church in general, ministry has biblical roots. In Hebrew, *sheret* ("to serve") applies to temple officers and was normally translated *leitourgein* in the Septuagint. This use was carried over into the New Testament, where the various linguistic forms of *leitourgein* are used not only for general acts of service to others (*Rom.* 15:27, *2 Cor.* 9:12, *Phil.* 2:30) but also for worship (*Acts* 13:3) and particularly for priestly and Levitical functions under the Old Covenant (*Lk.* 1:23; *Heb.* 8:2, 8:6, 9:21, 10:11). But the New Testament introduced the words *diakonia* ("service") and *diakonein* ("to serve"), referring to the menial work done by a *diakonos* ("servant") or *doulos* ("slave") to indicate the quality of ministry in the church. These words represent not status but the serving relationship of the minister to the one served: following the example of Christ (and, subsequently, the example of the apostle Paul) is at the heart of the Christian understanding of ministry (*Jn.* 13:1–20; *1 Cor.* 4:16, 11:1; *Phil.* 3:17).

Scholars dispute how far the New Testament reflects a uniform and obligatory pattern of ministerial orders. Roman Catholic scholars generally hold that it does, but most Protestant scholars believe that the New Testament offers several patterns of ministry (*Eph.* 4:11–12; *1 Cor.* 12:27–31; *1 Tm.* 3:1–13, 4:11–16, 5:3–10, 5:17–22). The former view main-

tains that the orders of ministry are fixed by tradition and that their authority is transmitted by historical succession from the apostles through bishops or the pope as the vicar of Christ (apostolic succession). The latter view regards ministerial orders as essentially functional and focused on faithful transmission of the apostolic testimony.

There is, however, agreement that all ministry traces its authority to Jesus Christ and to the apostles who testified to his saving work and resurrection (*Mt.* 16:13–24, 18:18, 28:18–20; *Jn.* 20:23). Although the apostle Paul could not claim personal connection with the Galilean ministry, he did claim commission from Jesus Christ as the heart of his own call to apostleship (*Gal.* 1:1, 1:11–24, 2:1–21). Churches also generally agree that officers in the church's ministry (i.e., the clergy) have particular responsibility for preaching, for administration of the sacraments (or ordinances), and for the oversight and nurture of their congregations.

By the beginning of the second century, three principal orders of ministry—bishop or pastor (*episcopos*, "overseer"), presbyter or priest (*presbuteros*, "elder"), and deacon (*diakonos*, "servant")—had become widely accepted, and although various confessional groups may not agree how far or when these orders became dependent on the Roman pontiff, the primacy of the pope seems to have been widely acknowledged by the time of Leo I (d. 461) and continued in the West until the Reformation. In the Eastern church the break with Rome, the Great Schism, is often given the date 1054, but scholars recognize that this was the end of a process of estrangement over centuries. However, the threefold ministry remained unchanged in both halves of Christendom through a millennium of Christian history.

Catholic branches of the church claim unbroken succession with this earlier history and believe that these offices are prescribed (i.e., *iure divino*) and guaranteed by apostolic succession. Ordination is a sacrament whereby the Holy Spirit is transmitted through the bishop's imposition of hands, which imparts special grace to administer the sacraments and to exercise authority in the church. In the Roman Catholic Church these powers derive ultimately from the pope, while among the Orthodox it is exercised by the bishop within the corporate authority of the Orthodox community. Old Catholics and Anglo-Catholics hold a position on apostolic succession close to that of Rome but do not acknowledge the infallible authority of the papacy.

The sixteenth-century Reformation challenged the absolute authority of ecclesiastical tradition and its priesthood. Protestants turned from papal authority to the authority of the Bible, which led to revisions in their understanding of the church and its ministry. In the main, they claimed to restore the New Testament pattern, and in reaction to ecclesiastical legalism they tended to appeal to the Bible as a divine law book. New Testament "restorationism" appears in the early Luther, based on a primary appeal to scripture and on scripture exegeted by "the priesthood of all believers." Luther may be described as advocating a form of "evangelical prag-

matism,” since he accepted any pattern consistent with scripture that served the effective preaching of the word and the proper administration of the sacraments. Lutheranism has therefore adopted episcopal, consistorial, and congregational forms of churchmanship.

Attempts to restore a more biblical pattern of church and ministry are to be found in almost every form of Reformation church, and not least the Reformed church. Differences between Ulrich Zwingli (1484–1531) and the Anabaptists (Swiss Brethren) were not over the primacy of scripture but over its interpretation. John Calvin (1509–1564) systematized the Reformed position, claiming that church and ministry are of divine institution (*Institutes* 4.1, 4.3). Like many in his day, he regarded apostles, prophets, and evangelists as peculiar to the apostolic age, although he recognized that they might be revived “as the need of the times demands.” Pastors and teachers, he argued, were indispensable. Pastors exercised general oversight discipline and preached and administered the sacraments; teachers were responsible for doctrine. Calvin also recognized the New Testament office of deacon in care of the poor (within which he included the office of the “widow”). He insisted on both the inward call of a minister and the recognition by the church of that call. In matters of discipline the pastor was to share power with a consistory of elders so that power would not be exclusively in the hands of a single person.

Calvin’s fourfold ordering of ministry was taken over by the Reformed church and the Puritans in the British Isles and colonial America in the Presbyterian and Congregational churches. Similar forms of ministry arose out of English Separatism (e.g., Baptist churches) and the Christian Church (Disciples of Christ) movement of the American frontier. Differences between the classic Reformation positions and later restoration movements turned not so much on the appeal to the Bible as on other matters affecting scriptural interpretation: the relationship of the church to civil authorities, insistence on the church’s purity, ministerial training, and how far literal appeal to scripture may be modified by the Holy Spirit revealed in scripture. Extreme restorationists reject any deviation from the New Testament pattern; at the other extreme, the Society of Friends (Quakers) claims that the spirit of the scriptures requires no specially ordained ministers.

A different modification of the church’s ministry is seen in the Anglican settlement. In the sixteenth century, Henry VIII sought to separate from Rome without changing the shape of the national church, and his daughter, Elizabeth I, followed his lead. She wooed English Catholics by maintaining traditional vestments, liturgy, and forms of church government (episcopal). From the first the Church of England tried to reconcile appeal to scripture and to church tradition. Originally the settlement was based on the authority of the crown (the divine right of kings), but at the turn of the seventeenth century appeals to the divine right of the episcopacy began to appear. Differences concerning the role of the epis-

copy are reflected in the so-called high church (Anglo-Catholic), broad church (Latitudinarian), and low church (Evangelical) traditions within Anglicanism.

In the eighteenth century, John Wesley, founder of Methodism, refused to separate from the Church of England. He finally became convinced that priests and bishops were of the same order in the New Testament and that he had the right to ordain ministers for America, but he refused to designate bishops and instead appointed superintendents. The decision to employ the term *bishop* in American Methodism probably arose from the determination to assert independence from Anglicanism. But although Wesley believed that the threefold order of ministry is scriptural, he offered an essentially pragmatic interpretation of these offices. His position was fundamentally the evangelical pragmatism seen in Luther.

By the mid-1980s there was no acceptance of the ordination of women in the Roman Catholic and Orthodox branches of the church, but a growing acceptance of women into the ordained ministry of Protestant denominations and in some provinces of Anglicanism was evident. Protestant and Anglican practices stem from the theological belief that the call to ministry is open to all God’s people. The ecumenical movement has also prompted many churches to reexamine earlier claims and to recognize that they have much to learn from each other. Statements on ministry prepared for the Consultation on Church Union (1984), which reflected the views of ten American Protestant denominations, and by the World Council of Churches (1982) indicate a significant and growing consensus. This consensus reveals an emphasis on the servanthood of ministry as evidenced in the ministry of Jesus; an awareness that the whole church is the proper context in which the ordained ministry should be considered; an awareness that the doctrines of church and ministry cannot be separated; and a recognition that the traditional threefold ordering of ministry should not be lightly discarded. This growing consensus shows that many Christian churches seek to manifest their essential unity and to arrive at a point where their ministries may be mutually recognized.

BIBLIOGRAPHY

The tendency today is to consider the doctrines of church and ministry holistically, and in any reading list on ministry, books about the doctrine of the church should find a place. Among the older books considering ministry, *The Apostolic Ministry*, edited by Kenneth E. Kirk (London, 1946), and T. W. Manson’s *The Church’s Ministry* (Philadelphia, 1948) must be mentioned because they illustrate a classic debate on apostolic succession in relation to episcopacy. For a general account of where the churches stand on the issues, *The Nature of the Unity We Seek*, edited by Paul Minear (Saint Louis, 1958), may be consulted, and also the relevant documents

in *The Documents of Vatican II*, edited by Walter M. Abbott (New York, 1966), for the Roman Catholic position.

One of the most thorough historical studies to be conducted in the United States is *The Ministry in Historical Perspectives*, edited by H. Richard Niebuhr and Daniel D. Williams (New York, 1956), and H. Richard Niebuhr's theological interpretation of that evidence, *The Purpose of the Church and Its Ministry* (New York, 1956), underscores the recognition that church and ministry cannot be separated. *The Pioneer Ministry*, by Anthony Tyrrell Hanson (London, 1961), an important biblical study of ministerial leadership in the Pauline churches, responds to assumptions made earlier in Kirk's book, while my own book *Ministry* (Grand Rapids, Mich., 1965) places this Anglo-Saxon debate within its ecumenical context. Ronald E. Osborn's *In Christ's Place: Christian Ministry in Today's World* (Saint Louis, 1967) arrives at similar conclusions on the basis of New Testament evidence.

The most important recent documents on ministry are those coming out of bilateral conversations, such as *The Ministry in the Church* (Geneva, 1982), published by the Roman Catholic/Lutheran Joint Commission; the documents produced by the Consultation on Church Union, such as the *Digest of the Plenary Meetings* (Princeton, 1979–) and *The COCU Consensus: In Quest of a Church of Christ Uniting* (Princeton, 1985); and the documents published by the World Council of Churches, particularly the "Lima Document," in *Baptism, Eucharist and Ministry*, "Faith and Order Paper no. 111" (Geneva, 1982).

MINOAN RELIGION SEE AEGEAN RELIGIONS

MIQVEH. In Jewish tradition, a *miqveh* (plural *miqva'ot*) is a pool of water, either natural or constructed, used for ritual purification of persons and objects.

BIBLICAL PERIOD. Biblical texts concerning contraction of ritual impurity, such as *Leviticus* 15 (impurity from bodily emissions), *Numbers* 19 (impurity from contact with a corpse), and *Numbers* 31:22–23 (impure objects), ordain

that immersion in water is required to remove ritual uncleanness in some instances. However, biblical legislation does not specify the nature of the pool or the source or amount of the water in which ritual immersion is to take place, nor does the word *miqveh* appear in the Hebrew Bible in this context. It seems likely that immersion in the biblical period was generally restricted to priests who were required to be ritually pure before partaking of the freewill offerings (*terumah*) given by the people.

SECOND TEMPLE PERIOD. The earliest archaeological remains of ritual bath installations date from the Hasmonaean period (second century BCE), when concern for ritual immersion appears to have become a public matter, possibly under influence from Hellenism, with its strongly developed bathhouse culture. More than three hundred *miqva'ot* dating from Hasmonaean times through the Roman period have been discovered in Judea and Galilee, half in the Jerusalem area; many were built beside agricultural installations (wine and olive presses) in both cities and villages, and others were constructed in the private dwellings of wealthy, often priestly, families. Hasmonaean ritual baths have been discovered in Jericho, Qumran, and Gezer, and it seems likely that some of the Roman period ritual baths were also in earlier use.

The most common use of such *miqva'ot* in the Second Temple period was purification prior to entering the area of the Temple. Many *miqva'ot* were located on the Temple Mount (over forty have been excavated south of the Double and Triple Gates), and the Temple itself contained pools for priests. A large number of valid *miqva'ot* were also available to festival pilgrims in towns and villages around Jerusalem. Rabbinic sources indicate that the Jewish court (*bet din*) supervised the construction, the validity, the measurements, and the cleanliness of the *miqva'ot* that served these crowds of visitors to the Temple. Because stored rainwater was always a scarce commodity, water from caves, springs, and rivers was utilized whenever possible in building *miqva'ot*.

RABBINIC PERIOD. *Miqva'ot*, the sixth tractate in the order *Tohorot* (purities) of the Mishnah (edited in the Land of Israel in the third century CE), discusses the characteristics of a valid *miqveh*, various ways of constructing a *miqveh*, and the nature and sources of the water necessary for a valid *miqveh*; it also delineates what constitutes valid immersion. According to this tractate, a *miqveh* must be hewn out of rock or built into the ground; it must also be made watertight, usually with plaster, because any leakage invalidates it. A *miqveh* must contain a minimum of forty *se'ah* (approximately one hundred gallons) of free-flowing clean water, sufficient for full immersion either vertically or horizontally. Rain- or springwater is valid, as is water diverted from a river, lake, or ocean. Once a *miqveh* contains the minimum of at least forty *se'ah* of valid water, drawn water of any amount may be added. Similarly if an upper *miqveh* contains forty *se'ah* of valid water and drawn water is then added to it and at least forty *se'ah* flows into the lower pool, that lower pool is also a valid *miqveh*. Because water must not flow through metal

vessels or other materials that are susceptible to ritual uncleanness, all pipes and other accessories are attached to the ground. The *miqveh* may not be emptied through a drain in the bottom; such a drain could allow leakage, and any drain plug would be regarded as an unacceptable vessel. A variety of construction methods based on these principles have developed over time.

MEDIEVAL PERIOD. *Miqva'ot* have been essential features of Jewish communities over the centuries. A recently discovered *miqveh* complex in the old Jewish quarter of Siracusa in Sicily probably dates from the sixth century CE and may be the oldest surviving ritual bathing area in Europe. Medieval *miqva'ot* have been discovered at a number of other European sites, including Cologne (c. 1170), Speyer (c. 1200), London (c. 1200), and Friedberg (c. 1260). The *miqveh* in Worms (c. 1190), a subterranean building with Romanesque architectural elements, is typical: from an aboveground structure, nineteen steps descend to an entrance hall, and then another eleven steps descend to the *miqveh*. A similar medieval underground *miqveh* also exists in Cairo. In many instances the *miqva'ot* of the Middle Ages also served as bath-houses because of orders from Christian rulers forbidding Jews to wash in rivers.

MIQVEH USE HISTORICALLY. Most biblical laws of ritual impurity lapsed with the destruction of the Second Temple in 70 CE, and since the rabbinic era the *miqveh* has been used most frequently by women who immerse prior to marriage, at a specified time in each menstrual cycle, and following the birth of children. *Miqveh* immersion is also obligatory according to *halakhah* (rabbinic legislation) as part of the ceremony of conversion to Judaism. Some Jewish groups have encouraged *miqveh* immersion for men on the eve of the Sabbath and festivals. The *miqveh* has also been used, in accordance with *Numbers* 31:22–23, to immerse new metal and glass vessels and vessels purchased from non-Jews.

The requirements of *miqveh* immersion for women are detailed in rabbinic *halakhah*, particularly in the Talmudic tractate *Niddah*, which discusses the practical consequences of women's menstrual and nonmenstrual discharges. In this rabbinic legislation biblical ordinances are expanded into a complicated system of rules for avoiding not only sexual intercourse but any physical contact between husband and wife during the wife's menses and for an additional seven days following the cessation of flow. On the eighth "white day" the wife must immerse in the *miqveh* before marital relations may resume (interestingly, immersion following menstruation is not a biblical commandment). The rabbinic *halakhah* is concerned with preserving men from the ritual pollution that would follow from any contact with their ritually impure wives. However, procedures for calculating the interval of time when spousal contact is forbidden relies heavily on a woman's knowledge of the stages of her cycle. Fidelity to the rules of self-examination and expedient immersion as soon as legally possible comprise one of the three areas of ritual obligations specifically incumbent on women (together

with separating a part of the dough used to make Sabbath loaves and kindling Sabbath lights). Jewish girls were traditionally taught to comply strictly and promptly with the regulations connected with the *niddah* (the menstruating woman). The process of immersion, which includes the recitation of a benediction, takes place only after the body has been thoroughly cleansed and must be complete; whereas one total immersion is sufficient according to the *halakhah*, three have become customary. Postmenstrual and postpartum women have usually visited the *miqveh* at night, often accompanied by other women.

CONTEMPORARY MIQVEH USE. In the first half of the twentieth century female *miqveh* observance appears to have declined significantly in North America, even among nominally traditional families, despite Orthodox exhortation in sermons and written tracts on the spiritual and medical benefits of *taharat hamishpahah* (family purity regulations), as these laws came to be called. Factors militating against *miqveh* use included disaffection of Americanized children of immigrants with their parents' Old World ways, the success of liberal forms of organized Judaism (the Reform, Conservative, and Reconstructionist movements) that did not advocate *miqveh* use, and the deterrent effect of ill-maintained and unhygienic *miqva'ot*. Many Jewish feminist writers of the late twentieth century also condemned *taharat hamishpahah* regulations as archaic expressions of male anxiety about the biological processes of the female body that reinforced the predominant construction in rabbinic Judaism of women as other and lesser than men.

However, the 1980s and 1990s saw a resurgence in the numbers of Orthodox Jews and a new sympathy for various previously discarded practices of traditional Judaism in Reform, Conservative, and Reconstructionist Judaism. In this period positive new interpretations of *miqveh* immersion developed, accompanied by construction of attractive modern *miqva'ot* in many Jewish communities. Contemporary Orthodox advocates of *taharat hamishpahah* regulations praised the ways in which they enhanced the sanctity of marriage and human sexuality, maintaining that traditional Judaism recognizes and values the fluctuating rhythms of human relationships by mandating a monthly separation between husband and wife when spousal communication and empathy must be enhanced in nonphysical ways. Supporters commended the elevating value of fulfilling a demanding divinely ordained mandate. They also praised the consciousness of the body and its functions that these rules impose on women and the feeling of personal renewal and rebirth following each immersion.

At the beginning of the twenty-first century *miqveh* immersion has become a symbolic expression of a new spiritual beginning for both women and men in all branches of Jewish practice beyond the domain of *taharat hamishpahah*. In addition to conversion to Judaism, rituals have developed that incorporate *miqveh* immersion as part of bar mitzvah and bat mitzvah (coming of age); before Jewish holidays; prior to

marriage; in cases of miscarriage, infertility, and illness; and following divorce, sexual assault, or other life-altering events. An indication of the probable long-term impact of this trend is the increased construction of *miqva'ot* by non-Orthodox Jewish communities.

JUDITH R. BASKIN (2005)

MIRABAI (b. circa 1500 CE) is the most famous medieval woman saint of *bhakti*, or devotional Hinduism. Known for her unwavering devotion to God in the form of Kṛṣṇa (the amorous incarnation of Viṣṇu) and for her suffering and perseverance in the face of extreme opposition to that love, Mirabai's lifestory and songs are performed throughout India and beyond. Like other *bhakti* saints, her sainthood was not conferred by any institutional authority but rather by countless subsequent devotees who have found in her an exemplar of the ideal devotee and a spiritual guide.

According to hagiographic and legendary accounts, Mirabai was born to a minor royal family in Merta, Raja-

sthan, in western India, probably around the beginning of the sixteenth century. Devoted to Kṛṣṇa from childhood, she was married into the royal family of the neighboring kingdom of Mewar, but she refused to honor her new husband or his family, seeing Kṛṣṇa as her true husband and Lord. Her in-laws found her behavior as a woman intolerable, particularly her public dancing and singing in temples and her conversing openly with holy men. Attempts were made first to stop her and then to kill her, the method of choice being poison. Who tried to kill her varies by account. Some say she was a devoted wife and it was only after her husband's death that an evil brother-in-law began to persecute her, but many more name her husband as her would-be killer.

The Mughal emperor Akbar is said to have come in disguise to see this renowned devotee of God, her appeal extending across religious boundaries. But eventually she grew weary of persecution and left her marital home to become a wandering saint, going first to Kṛṣṇa's holy city of Vrindavan. There Jiv Goswami, disciple of Caitanya (1486–1533), initially refused to meet her, having vowed not to speak to women, but he then welcomed her after she reminded him that all souls are feminine in the presence of the decidedly male Lord Kṛṣṇa. She settled in Dvaraka until a delegation of Brahmin priests arrived from her marital family to escort her back, threatening to fast to death if she refused. Entering the temple to take leave of Kṛṣṇa, she disappeared, merging with his image.

Other stories also speak of Mirabai taking the untouchable leatherworker Raidas as her guru, an act which places her under male authority but also adds defiance of caste to her transgressions. The story of Mirabai's life has inspired not only devotees of God, but also oppressed low-caste people; women whose suffering, longing, and independence parallel hers; Indian nationalists seeking heroic Indian women to inspire their struggle against the British; and such figures as Mahatma Gandhi (1869–1948), for whom she was an ideal practitioner of non-violent resistance. Upper-caste male historians have also sought to write the definitive historical biography of Mirabai, but historical sources record little about her, and Parita Mukta has even argued that Mirabai's marital family sought to actively suppress her memory. The resulting biographies, like the stories told by others, are—and indeed must be—shaped significantly by the values and assumptions of the tellers. The dates they give for events in her life and the assignment of Bhoj Raj, son of Sanga, as her husband must be treated as speculative.

Like other *bhakti* saints, Mirabai expressed her devotion in songs which have been primarily preserved and disseminated through oral traditions. No early extensive written collections of her songs exist, though such collections are available for male saints like Kabīr (c. 1450–1525) and Surdas. Unlike them, Mirabai was never formally adopted by any institutionalized branch of devotional Hinduism—she remained well loved but outside such structures, in all likelihood because of her independent behavior as a woman.

Among the songs attributed to her, those actually composed by the sixteenth-century woman cannot be distinguished from those composed by others in her name and style.

These songs speak in the first person of deep love and longing for God and of Mirabai's persecution and rejection of the royal world of her husband. They traverse the range of emotions connected with love—longing, anticipation, the ecstatic joy of union, adoration, jealousy, and anger—but also speak of a merger with the One who transcends all distinctions and forms. Throughout her stories and songs, the overriding theme is absolute love of God, with complete disregard for the consequences.

The variations in the telling of Mirabai's story show a deep appreciation for her devotion coupled with a recognition of the depth of opposition she faced and consequent suffering she endured. However, they also reflect the ambivalence that continues to surround a woman's defiance of social norms even out of devotion to God. Mirabai remains immensely popular as a saint but also both powerful and controversial as an exemplary woman.

MIRACLES

This entry consists of the following articles:

AN OVERVIEW
MODERN PERSPECTIVES

MIRACLES: AN OVERVIEW

The history of religions has preserved the record of miracles, that is, events, actions, and states taken to be so unusual, ex-

traordinary, and supernatural that the normal level of human consciousness finds them hard to accept rationally. These miracles are usually taken as manifestations of the supernatural power of the divine being fulfilling his purpose in history, but they are also caused to occur "naturally" by charismatic figures who have succeeded in controlling their consciousness through visions, dreams, or the practices of meditation. Although miracles have assumed diverse forms, healing miracles and exorcisms have often attracted most attention.

However diverse the forms may be, miracles are preeminently sociological phenomena. It is, of course, true that no miracles exist without miracle workers who often claim religious authority of one kind or another based on their performance of miracles; but as the etymological meaning of the word *miracle* (Lat., *miraculum*) may suggest, one of the conditions indispensable for the creation of miracles is the presence of those people, spectators, who take the performance of miracle workers to be wonderful, extraordinary, and worthy of admiration. These people are often the followers of miracle workers, witnesses of miracles, or professional priests or laymen of the cults at whose shrines, temples, or caves miracles have occurred, and it is they who are often responsible for the creation and propagation of miracle stories in which the saving power of the divine beings and the extraordinary personality of miracle workers are extolled.

MIRACLES IN THE "PRIMITIVE" TRADITION. In primitive societies religious specialists, such as magicians, medicine men, sorcerers, and shamans, are known for their performance of miracles as well as for their exercise of magico-religious powers. They have acquired such miracle-working powers through the practices of meditation, vision quest, or a series of initiatory sicknesses and dreams.

In some parts of Asia, Australia, and North America, it is believed that illness is caused by the intrusion of a magical object into the patient's body, or through his possession by evil spirits. Healing is effected by magicians, sorcerers, or medicine men through the extraction of the harmful object or the expulsion of demons. Among the Aranda in central Australia, for example, a man is initiated into the profession of medicine man through a series of hardships and rituals: one of the older medicine men pierces the index finger of the novice with a pointed magical wand. By this operation the novice acquires the ability to drive out the objects causing illness in his future patients. The old medicine man also seizes the tongue of the novice and cuts a hole in it with a sharp stone knife. This is done to enable him to suck out the evil magical forces to be found in the bodies of his patients.

The vision quest among the Indians of North America is a means of acquiring supernatural power through personal contact with the divine. In California, the vision is sought by shamans wishing to effect a cure. The shaman occupies a unique place among religious specialists due to his ability, in a trance state, to make the ecstatic journey to the beyond. He is engaged in the spiritual journey most often when he has to cure the sick; when he finds that the illness of a sick

person has been caused by the loss of his soul, the shaman searches for the lost soul in heaven, in distant space, and most frequently in the underworld.

The shaman acquires the power of healing as well as other magico-religious powers through his unique psychic experience. In Siberia, as a rule, the future shaman is sick for an indefinite period of time; he stays in his tent or wanders in the wilderness, behaving in such eccentric ways that he could be mistaken for a madman: he becomes suddenly frenzied, loses consciousness, feeds on tree bark, or flings himself into water and fire. These pathological symptoms can properly be interpreted in terms of initiatory trials, which the future shaman is destined to undergo in order to be miraculously transformed into a "new being."

Significantly, in the state of sickness, dreams, and visions, the future shaman has the experience of being dismembered, reduced to bones, and then given entirely new internal organs. For example, a Tunguz shaman (Ivan Cholko) states that before a man becomes shaman he is sick for a long time, his head being in a state of confusion. The spirits of the dead shaman-ancestors come, cut his flesh in pieces, and drink his blood. They also cut off his head and throw it into a caldron. According to a Buriat shaman (Mikhail Stepanov), before a man becomes shaman he is sick for a long time. Then the spirits of dead shamans come and teach him; he becomes absentminded, speaking with the dead shamans as if he were with living persons. He alone is able to "see" the spirits. They torture him, strike him, and cut his flesh in pieces with knives. During this surgical operation the future shaman becomes half dead; the beating of his heart is scarcely heard, his breathing is weak, and his face and hands are dark blue. A Yakut shaman (Petr Ivanov) gives further details concerning the initiatory ordeal of dismemberment, followed by the renewal of the body: his limbs are removed and disjointed with an iron hook by the spirits of ancestral shamans; the bones are cleaned, the flesh scraped, the body fluids thrown away, and the eyes torn out of their sockets. After this operation all the bones are gathered up, joined together with iron, and new eyes are put in place. He is thus transformed into a new being, a shaman.

The experiences described above by no means exhaust the shaman's transforming initiatory trials. The Inuit (Eskimo) shaman, for example, acquires the *qaumaneq* (mystical light). "The first time a young shaman experiences this light," Knud Rasmussen states, "it is as if the house in which he is suddenly rises; he sees far ahead of him, through mountains, exactly as if the earth were one great plain, and his eyes could reach to the end of the earth" (*Intellectual Culture of the Igtulik Eskimos*, Copenhagen, 1930, p. 113). According to Franz Boas: "When a person becomes shaman, a light covers his body. He can see supernatural things. The stronger the light is within him, the deeper and further away he can see, and the greater is his supernatural power. The light makes his whole body feel well. When the intensity of this light increases, he feels a strong pressure, and it seems to him

as though a film were being removed from his eyes which prevented him from seeing clearly. The light is always present with him. It guides him, and enables him to see into the future and back into the past" (*The Eskimo of Baffin Land and Hudson Bay*, New York, 1901, p. 133).

Shamans must demonstrate to spectators the new, superhuman condition that they have acquired: they gash themselves with knives, touch red-hot iron, and swallow burning coals. Shamans are masters over fire. They also incarnate the spirit of fire to the point where, during séances, they emit flames from their mouths, noses, and whole bodies. The practice of fire walking is imposed on shamans and medicine men in, for instance, Australia, Indonesia, China, and among the Manchu. Sometimes a shaman must prove his miraculous powers by resisting the most severe cold or by drying a wet sheet on his naked body. Among the Manchu, for example, nine holes are made in the ice during winter; the candidate has to dive into the first hole, come out through the second, and so on to the ninth hole. A young Labrador Inuit obtained the title of *angakkoq* (shaman) after remaining five days and nights in the icy sea and proving that he was not even wet. A shaman sometimes shows his miraculous powers to the public by climbing a ladder of knives. Among the Lolo in southern China, a double ladder made of thirty-six knives is built, and the barefoot shaman climbs it to the top, then comes down on the other side. Similar feats are also attested in other parts of China and among the Chingpaw of Upper Burma.

MIRACLES IN THE MEDITERRANEAN WORLD. In archaic Greece, Abaris, Aristes, and Epimenides were known for their wonders and miracles. Abaris was a shamanic figure; carrying the golden arrow in his hand, he passed through many lands, dispelling sickness and pestilence, and giving warning of earthquakes and other disasters. He was also known to fly through the air on his arrow, a symbol of magic flight. Aristes of Proconnesus could appear at the same time in two places far apart, sometimes assuming the form of a crow. Epimenides was a master of the techniques of ecstasy, well known for his miraculous powers; he journeyed through many lands, bringing his health-giving arts with him, prophesying the future, interpreting the hidden meaning of past occurrences, and expelling the demonic evils that arose from misdeeds of the past.

Especially noteworthy is Pythagoras, whose image in the Hellenistic Mediterranean world was quite complex in nature. According to his biographies by Porphyry and Iamblichus dating from the third and fourth centuries CE, Pythagoras was a "divine man" (*theios anēr*), combining the figure of the popular miracle worker, the portrait of the philosopher, and the idealized image of the practical statesman. His image as miracle worker was enhanced by several recurring motifs: (1) Pythagoras was seen in two cities at the same time; (2) he could recall his previous existences; (3) he was endowed with the ability to stop an eagle in flight; and (4) he could predict events in the future. It is highly probable

that, as Neo-Pythagoreanism gained popularity among ordinary people, the image of Pythagoras the thaumaturge was promoted by a circle of followers quite distinct from those who wished to cultivate his reputation as a philosopher and scientist.

Apollonius of Tyana, a wandering Pythagorean philosopher of the first century CE, also worked miracles. It is generally accepted that early traditions about his activity as a miracle worker were incorporated into subsequent accounts of his life, which were apologetically intended to present him as a philosopher. Apollonius described exorcisms and instances of healing the blind, the lame, and the paralytic in India (see Philostratus, *The Life of Apollonius of Tyana* 3.38–39); more important than that, he performed similar miracles himself. Apollonius reportedly performed even the miracle of raising the dead while he was in Rome (4.45): a girl had died just before her marriage, and the bridegroom was following her bier lamenting; the whole of Rome lamented with him, for she belonged to a consular family. Apollonius, meeting the funeral procession, said, “Put down the bier, for I will put a stop to your tears for the girl.” Then he asked her name. The crowd thought he was going to deliver a funeral oration, but he merely touched her and said something in secret over her, and thus he awoke her from her seeming death. In the magical papyri, his name is attached to a spell, a fact indicating his considerable popularity as a magician. According to Dio Cassius, the Roman emperor Caracalla (r. 211–217) built a temple in honor of Apollonius, who was a “perfect example of the magician.”

The figure of Moses was one of the most important propaganda instruments that Jews of the Hellenistic period used in their competition with non-Jewish schools and cults. In *Deuteronomy* 34:10–12, Moses is described as the greatest prophet in Israel, known for his signs and wonders as well as for his mighty powers and great and terrible deeds. This Moses was presented to the Hellenistic world as a miracle-working philosopher, as is exemplified in Philo Judaeus’s *On the Life of Moses*.

There are many stories in late Judaism narrating how rabbis worked miracles of healing. The best known, perhaps, is the healing of the son of Yoḥanan ben Zakk’ai by Ḥanina’ ben Dosa’. Both rabbis lived in Palestine around 70 CE. Ḥanina’ ben Dosa’ went to study the Torah with Yoḥanan ben Zakk’ai, whose son was seriously ill. Yoḥanan requested: “Ḥanina’, my son, pray for mercy for him that he may live.” Ḥanina’ ben Dosa’ laid his head between his knees and prayed, and then the boy was cured (B.T., *Ber.* 34).

Miracles of healing were performed also by kings, for example, the Roman emperor Vespasian (r. 70–79). While the emperor was in Alexandria, a blind man approached him, acting on the advice of the god Sarapis; he fell at Vespasian’s feet, demanding with sobs a cure for his blindness and imploring the emperor to moisten his eyes with the spittle from his mouth. Another man with a maimed hand, also inspired by Sarapis, asked Vespasian to touch it with his heel. “To the

great excitement of the bystanders,” states Tacitus, Vespasian “did as the men desired him. Immediately the hand recovered its functions and daylight shone once more in the blind man’s eyes” (*Histories* 4.81; see also Dio Cassius, *Roman History* 65.8, and Suetonius, *Vespasian* 7.2–3).

Throughout late antiquity, Epidaurus was a holy site especially celebrated for the epiphany of Asklepios, the divine healer. According to Strabo, Asklepios was believed to “cure diseases of every kind.” His temple was always full of the sick as well as containing the votive tablets on which treatments were recorded (*Geography* 8.6.15). Asklepios would appear to the sick sleeping in his temple—more precisely, in the innermost chamber (*to abaton*) of the sanctuary; he would approach the sick in dreams and visions, or, as Aelius Aristides put it, in a “state of mind intermediate between sleep and waking.” This practice of temple sleep, incubation (*incubatio*), was of vital importance to the sick; it was in the state of such dreams and visions that one was healed or given instructions by Asklepios. The healing god would touch his patient’s body with his hands, apply drugs, or undertake surgical operations. Consequently, the eyesight of the blind would be restored, the lame would walk, the mute would speak, and the man whose fingers had been paralyzed would stretch each of them one by one. Some examples of Asklepios’s miracles follow.

Ambrosia of Athens, blind in one eye, came to Epidaurus to seek help from Asklepios. But as she walked around the temple, she mocked at the many records of divine healings: “It is unbelievable and impossible that the lame and the blind can be cured by merely dreaming.” In her sleep she had a dream: Asklepios approached and promised to heal her; only in return she must present a gift offering in the temple—a silver pig, in memory of her stupidity. After saying this, Asklepios cut open her defective eye and poured in a drug. Her sight was soon restored. The following miracle story about a man with an abscess inside his abdomen reminds us of the initiatory dreaming of Siberian shamans. While asleep in the temple, the man saw a dream: Asklepios ordered the servants who accompanied him to hold him tightly so that he could cut open his abdomen. The man tried to escape but could not. Then Asklepios cut his belly open, removed the abscess, and stitched him up. Sometimes, the healing power of Asklepios reached the patient far away from his temple. Arata, a woman of Lacedaemon, was dropsical. While she remained in Lacedaemon, her mother slept in the temple on her behalf and saw a dream: Asklepios cut off her daughter’s head and hung up her body in such a way that her throat was turned downward. Out of it came a huge quantity of fluid matter. Then he took down the body and put the head back onto the neck. After the mother had seen this dream, she went home and found her daughter in good health; the daughter had seen the same dream.

The Mediterranean world knew Egypt as the home of thaumaturgy, theosophy, and esoteric wisdom. There, the goddess Isis was praised for her miraculous healings; she was

credited with bringing the arts of healing to men and, once she had attained immortality, taking pleasure in miraculously healing those who incubated themselves in her temple (Diodorus Siculus, *The Library of History* 1.25.2–5). At her hands the maimed were healed and the blind received their eyesight. According to the inscriptions found on the island of Delos dating from about the first century BCE, Isis worship was attended by a functionary specifically called an *aretalogos*, an interpreter of dreams, who may have functioned as a proclaimer of miraculous events. The temple of the god Sarapis at Canopus, not far from Alexandria, was also famous for its divine healing; Sarapis would visit those who slept in his temple, giving them advice in dreams.

YOGINS, DAOIST CONTEMPLATIVES, AND YAMABUSHI. Indian ascetics practicing Yoga are well known for their miraculous powers. The yogin sits cross-legged and firm on a flat space with his eyes fixed on a certain object beyond him. He has to master, at the same time, the breathing techniques (*prāṇāyāma*); at first, the breath is kept for one minute and then exhaled. This practice goes on for days, weeks, and months until the period of retention of the inhaled breath is gradually increased.

According to the Indo-Tibetan Tantric tradition, the ascetic is able to produce “inner heat” on the basis of rhythmical breathing and various “visualizations.” During a winter-night snowstorm, the degree of his progress is tested by his ability to dry a large number of soaked sheets draped directly over his naked body. “Sheets are dipped in the icy water,” reports Alexandra David-Neel. “Each man wraps himself in one of them and must dry it on his body. As soon as the sheet has become dry, it is again dipped in the water and placed on the novice’s body to be dried as before. The operation goes on until daybreak. Then he who has dried the largest number of sheets is acknowledged the winner of the competition” (*With Mystics and Magicians in Tibet*, London, 1931, pp. 227–228).

The yogin acquires the “miraculous powers” (*siddhis*) when he has reached a particular stage of his meditational discipline called *saṃyama*, referring, more specifically, to the last stages of yogic technique, that is, concentration (*dhāraṇa*), meditation (*dhyaṇa*), and *samādhi*. For example, by practicing *saṃyama* in regard to the subconscious residues (*saṃskāras*), the yogin knows his previous existences; through the practice of Yoga, he arrives successfully at the state of mind in which he is one with the things meditated, namely, his subconscious residues. This enables him to ideally relive his former existences. Through *saṃyama* exercised in respect to notions (*pratyaya*), the yogin also knows the mental states of other men; he sees, as on a screen, all the states of consciousness that notions are able to arouse in their minds. Some of the yogin’s “miraculous powers” are even more extraordinary: he can make himself invisible by practicing *saṃyama* concerning the form of the body. “When the yogin practices *saṃyama* on the form of the body,” Vācaspatimiśra comments, “he destroys the perceptibility of the color (*rūpa*)

that is the cause of perception of the body” (Eliade, 1958, p. 87).

In India, the yogin has always been considered a *mahāsiddha*, a possessor of miraculous powers, a magician. However, a yogin is still far from attaining his final goal of absolute freedom so long as his miraculous powers serve him as his “possession.” As soon as he consents to use the magical forces gained through his ascetic discipline, the possibility of his realizing absolute freedom diminishes; only a new renunciation, a determination not to use the miraculous powers, would lead the ascetic to a higher spiritual horizon.

Daoists in ancient China are convinced that man can become an “immortal” (*xianren*, *shenxian*, or *shengren*), that man is able to transcend his human condition by various means, including the practice of meditation. The *Zhuangzi* tells of one such extraordinary man living on a remote mountain: “He does not eat the five grains, but sucks the wind, drinks the dew, climbs up on the clouds and mist, rides a flying dragon, and watches beyond the four seas” (chap. 1). Moreover, “by concentrating his spirit, he can protect creatures from sickness and plague and make the harvest plentiful” (ibid.). Abstention from cereals belongs to a basic requirement in Daoism for nourishing life, as is illustrated by Ge Hong’s *Baopuzi* dating from the early fourth century CE. “Sucking the wind” and “drinking the dew” are technical terms in Daoism for breathing exercises. It is certain that the story speaks about a Daoist contemplative on his ecstatic journey, transcending the universe. Especially interesting in the story is the fact that he is able to “concentrate his spirit,” that is, to solidify his spiritual potency. The ability to solidify the spiritual potency or light belongs to the privilege of such religious specialists as shamans, yogins, and Daoist saints. According to Max Kaltenmark, the solidification of the spiritual potency points to an essential feature of the Daoist technique of meditation, which consists in freezing the faculties of the soul, concentrating them in a single point.

The practice of meditation essential for attaining immortality leads inevitably to the possession of miraculous powers. According to the *Baopuzi*, the Daoist immortal Ge Xuan, one of Ge Hong’s paternal uncles, would stay at the bottom of a deep pond for almost a whole day in hot summer weather. This “miracle” was possible because of his mastery of “embryonic respiration”: he was able to accumulate his breaths and to breathe like a fetus in its mother’s womb. Ge Xuan was a disciple of the famous Daoist immortal Zuo Ci, of whom it is said that, despite abstinence from eating cereals for almost a whole month, his complexion remained unchanged and his vitality stayed normal (*Baopuzi*, chap. 2).

Mountain ascetics in Japan known as *yamabushi* acquired magico-religious powers through a series of disciplines. The *yamabushi* was the master of heat and fire; he walked barefoot on red hot charcoals without injury; he proved his extraordinary power when, with only a white robe on his naked body, he entered a bath of boiling water and came out entirely unscathed; and he surprised his spectators

by climbing a ladder of swords, the sharp edge facing upward. Like a shaman, he was a spiritual being. In his inner consciousness he was a bird in control of cosmic space; at the culminating moment of a ceremony, the *yamabushi* in a trance would spread his arms and fly in the sky in imitation of a bird. In view of the extraordinary powers at his disposal, it is not surprising that he cured the sick, exorcised demons, and fought triumphant battles against evil spirits.

MIRACLES IN FOUNDED RELIGIONS. The founders of three major religions of the world—Buddhism, Christianity, and Islam—have each taken a different attitude toward miracle; Jesus Christ was utterly positive in working miracles, whereas Muḥammad, as represented in the Qurʾān, categorically rejected them. Significantly, the Buddha took the middle course, so to speak. Despite this remarkable divergence among these founders, the subsequent history of these religions demonstrates unmistakably that miracles and miracle stories have been an integral part of man's religious life.

Buddhism. The Buddha was well aware that the practice of meditation essential for attaining enlightenment leads eventually to the possession of "miraculous power" (Skt., *siddhi*; Pali, *iddhi*). But he did not encourage his disciples to seek *siddhis*. "O *bhikkus*," the Buddha said, "you must not show the superhuman power of *iddhi* before the laity. Whoever does so shall be guilty of an evil deed" (*Vinaya Texts*, trans. T. W. Rhys Davids and Hermann Oldenberg, vol. 3, Delhi, [1885] 1965, p. 81). The true task was not to acquire miraculous powers but to transcend the world of pain and suffering and to attain the state of enlightenment (see *Dīgha Nikāya* 24.3). Moreover, the possession of one miraculous power or another in no way promoted, in the Buddha's mind, the propagation of the central message of Buddhism; yogins, ecstasies, and other ascetics could perform the same miracles.

"Miraculous powers" are one of the five classes of "superknowledge" (Skt., *abhijñā*; Pali, *abhiññā*), which are (1) *siddhi*, (2) divine eye, (3) divine hearing, (4) knowledge of another's thought, and (5) recollection of previous existences. By virtue of deepening meditation, the Buddhist saint is able to acquire the *siddhi* in its various forms: he becomes invisible at his own will; he goes, without feeling any obstacle, to the far side of a wall or rampart or hill, as if through air; he penetrates up and down through solid ground, as if through water; he walks on water without breaking through, as if on solid ground; and he travels cross-legged in the sky, like the birds on the wing (*Dīgha Nikāya* 2.87, 11.4).

According to biographical sources, the Buddha himself was sometimes led to work miracles; for example, when he returned to his native city, Kapilavastu, for the first time after attaining enlightenment, he rose in the air, emitted flames of fire and streams of water from his body, and walked in the sky (see *Mahāvastu* 3.115). According to Aśvagoṣa's *Buddhacarita* (19.12–13), in order to convince his relatives of his spiritual capacities and prepare them for conversion, the Buddha rose in the air, cut his body to pieces, let his head

and limbs fall to the ground, and then joined them together again before the amazed eyes of the spectators. Among the eminent disciples of the Buddha, Moggallāna (Skt., Maudgalyāyana) was well known as the "chief of those endowed with miraculous powers."

As Buddhism was transplanted to China, its missionaries often resorted to the display of miraculous powers. Especially in northern China, Buddhist saints performed magical feats for evangelical purposes; Fotudeng, who came to China at the beginning of the fourth century CE, worked the miracles of producing rain, creating a lotus out of a bowl of water, and drawing water from dried-up wells. The fame of the monk Dharmakṣema was based not only on his scholarly contributions but also on his supernatural powers to produce rain and foretell the outcome of political events or military campaigns. One may not be prepared to accept all of these miracle stories told by pious biographers, but they were undoubtedly created with the good intention of glorifying the Buddha, who was able to endow his ardent followers with such miraculous powers.

Christianity. Jesus Christ performed the miracles of healing and exorcism. In the miracle stories that, together with his sayings and passion narratives, occupy an important place in the Synoptic Gospels, Jesus of Nazareth is presented as the supreme thaumaturge, the great miracle worker, the magician. In fact, there was a charge that Jesus was in league with Beelzebul (*Mk.* 3:22, *Mt.* 12:24, 12:27) and, according to a rabbinic tradition (see B.T., *San.* 43a), Jesus was executed for his practice of sorcery, misleading the people of Israel.

Typically, the miracle stories of healing and exorcism in the Synoptic Gospels all emphasize three motifs: (1) the history of the illness, (2) the actual process or techniques of the healing, and (3) a demonstration of the cure to the satisfaction of spectators. There is no doubt that the miracle stories were utilized internally for the strengthening of Christian faith and externally for propaganda purposes in a world in which such stories were commonly told of heroes of faith.

Particularly interesting are the techniques that Jesus employed for healing and exorcism. There is no question that he considered prayer to be essential for working miracles (*Mk.* 9:29). But, as a thaumaturge, he had to work up his emotions; in healing a leper Jesus was moved with "anger" (*orgistheis*), stretched out his hand, and touched him (*Mk.* 1:40–45). Jesus displayed the emotional frenzy of the thaumaturge (see also *Lk.* 4:39). In the story of the deaf and mute man (*Mk.* 7:32–37), Jesus puts his fingers into his ears, spits and touches his tongue. Looking up to heaven, he sighs and says to him, "Ephphatha" ("Be opened"). In *Mk.* 8:22–26 Jesus heals a blind man by spitting on his eyes and laying his hands on them. Groaning sighs and spittle were often used by the thaumaturges. As to the use of Semitic words for healing purposes, the account in the *Gospel of Mark* (5:41) of Jesus restoring a girl to life by saying, "Talithā Koum" ("Little girl, stand up"), retains the original Aramaic words even in otherwise translated versions. According to the Ger-

man theologian Martin Dibelius, the preservation of such foreign words and phrases may show that the stories were utilized as a kind of handbook to Christian miracles and magic. The image of Jesus as the thaumaturge can still be identified in the *Gospel of John* (see 9:6, 11:33, 11:35, 11:38, 11:43).

Especially interesting is a cycle of miracle stories in the *Gospel of Mark* (4:35–5:43) that includes the stories of the Gerasene demoniac, the woman with an issue of blood, and the daughter of Jairus. Each of these has all the characteristics of the popular miracle story, and each contributes to the impression that Jesus is a “divine man,” tempting New Testament scholars to talk about the development of “divine man Christology” in the *Gospel of Mark*, the miraculous power of Jesus is such that the Gerasenes beg him to leave their district, the touch of his clothes effects a cure, and he raises the dead by strange-sounding words. Moreover, Jesus is presented as performing the miracles of stilling the storm (4:35–41), feeding the five thousand people (6:34–44; see also 8:1–9), and walking on water (6:45–52).

Jesus Christ was followed by his apostles in working miracles (*Acts* 2:43, 5:12), and it seems that they worked the miracles of healing and exorcism “in the name of Jesus Christ” (*Acts* 3:6, 16:18; see also 19:13–17). Stephen and Philip demonstrated great wonders and signs among the people (*Acts* 6:8, 8:5–7), while Peter healed the lame and the paralytic, restoring the dead to life (*Acts* 3:1ff., 9:32ff., 9:36ff.). Even his “shadow” was believed to have healing power (*Acts* 5:15). Paul is also presented in *Acts* as a great miracle worker: he healed a cripple at Lystra (14:8ff.), performed an exorcism in the name of Jesus Christ (16:18), and cured Publius’s father, who was sick with fever and dysentery, by putting his hands on him (28:8). Even handkerchiefs and aprons that had touched Paul’s body were believed to be effective for curing sickness and exorcism (19:11–12). In *Acts* 13:4–12, Paul evokes belief in the proconsul Sergius Paulus by showing his superior thaumaturgy over the Jewish magician Bar-Jesus and another magician, Elymas.

As we can see from the portrayal of these apostles in *Acts*, the Christian community in the Hellenistic Mediterranean world had a tendency to view its heroes as “divine men”; Paul’s opponents in Corinth, especially those he argued against in 2 *Corinthians*, understood a Christian apostle as one who exhibited the aura and power of a “divine man,” and they claimed it of themselves and wanted Paul to demonstrate it of himself. Accordingly, Paul had to write to the Corinthians that he had shown the signs of a true apostle among them, “with signs and wonders and mighty works” (2 *Cor.* 12:12; see also *Rom.* 15:18–19a; 1 *Cor.* 12:9–10; *Gal.* 3:5).

Jesus Christ and his apostles in the first century set the examples to be followed by the faithful. In the subsequent history of Christianity, charisma or divine gift of “power” was represented on earth by a limited number of exceptional charismatic figures, such as the martyrs of the second and third centuries, the bishops of the late third century, and, fi-

nally, the succession of great Christian saints of ascetic origin, from Anthony onward.

Islam. Muḥammad, the “seal of the prophets,” rejected every request to pose as a miracle worker; in contrast to Moses and other Hebrew prophets, as well as Jesus, who all worked miracles (*muʿjizāt*), Muḥammad made no attempt to advance his religious authority by performing miracles, although people demanded them, saying, “Why does he not bring us a sign from his Lord?” (*sūrah* 20:133). To those people who wondered why signs, that is, miracles, had not been sent down on him from God, Muḥammad responded: “The signs are only with God, and I am only a plain warner” (29:49; see also 13:27–30, 17:92ff.).

According to Muḥammad, as presented in the Qurʾān, all the existing things in the universe are the signs (*āyāt*; sg., *āyah*) pointing to the reality of God in action. Natural phenomena, such as rain, wind, the structure of heaven and earth, the rhythmical alternation of day and night, and so forth, are not simply “natural” occurrences; they should be understood as “signs” or “symbols” manifesting God’s mercy and compassion for man’s well-being on earth. God declares, “We shall show them our signs in the horizons and in themselves” (41:53; see also 51:20–21). The universe is thus miraculously transformed into a forest of symbols; human beings dwell within the forest of divine symbols, and these symbols can be deciphered by anyone if he is spiritually prepared to interpret them as symbols. There should be no miracles except for these “signs.”

However, the majority of the Islamic community has never ceased to expect miracles. Muḥammad is presented in the traditions (*ḥadīths*) as having worked miracles in public on many occasions. It was especially Ṣūfī saints who performed miracles (*karāmāt*). Often called the “friends of God” (*awliyāʾ*, sg. *walī*), they worked miracles by divine grace. On the one hand, it is often said by the Ṣūfīs that saints must not seek after the gift of miracle working, which might become a serious obstacle in the path to the union with God. On the other hand, the biographies of leading Ṣūfīs abound in miracle stories that certainly have been utilized for evangelical purposes: saints traveled a long distance in a short time; walked on water and in the air; talked with such inanimate objects as stones, as well as with animals; miraculously produced food, clothing, and other necessities of life; and made predictions of future events. Even after their death, saints are believed to work miracles at their own graves on behalf of the faithful, and their intercession is piously invoked.

BIBLIOGRAPHY

There is no comprehensive book dealing with the topic of miracles in the general history of religions. On the problem of interpretation concerning miracles and magico-religious powers

in “primitive” societies, see Ernesto de Martino’s *Il mondo magico* (Turin, 1948), translated by Paul S. White as *The World of Magic* (New York, 1972). On the miracles and miraculous powers of shamans, there is an admirable account in Mircea Eliade’s *Shamanism: Archaic Techniques of Ecstasy*, rev. & enl. ed. (New York, 1964). This book contains an excellent bibliography.

Richard Reitzenstein’s *Hellenistische Wundererzählungen* (1906; reprint, Darmstadt, 1963) still remains a classic for the study of the miracle stories in the Hellenistic Mediterranean world. Otto Weinreich has offered a detailed analysis of some of the major motifs appearing in the Greco-Roman stories of healing miracles. See his *Antike Heilungswunder: Untersuchungen zum Wunderglauben der Griechen und Römer* (Giessen, 1909). Valuable information on the miracle stories pertaining to the cult of Asklepios is presented in Emma J. Edelstein and Ludwig Edelstein’s *Asclepius: A Collection and Interpretation of the Testimonies*, 2 vols. (Baltimore, 1945). See also Károly Kerényi’s important study *Die göttliche Arzt: Studien über Asklepios und seine Kultstätten*, rev. ed. (Darmstadt, 1956), translated by Ralph Manheim as *Asklepios: Archetypal Image of the Physician’s Existence* (New York, 1959). Miracle stories in rabbinic Judaism have been collected by Paul Fiebig in his *Jüdische Wundergeschichten des neutestamentlichen Zeitalters* (Tübingen, 1911).

On the miraculous powers of yogins, there is a brilliant account in Mircea Eliade’s *Yoga: Immortality and Freedom*, 2d ed. (Princeton, 1969), still the standard work on the theory and practice of Yoga. On Daoist immortals and their miraculous powers, there is a brief but excellent account in Max Kaltenmark’s *Lao Tseu et le daoïsme* (Paris, 1965), translated by Roger Greaves as *Lao Tzu and Taoism* (Stanford, Calif., 1969).

On miracles in the life of the Buddha, see a valuable account in Edward J. Thomas’s *The Life of Buddha as Legend and History*, 3d rev. ed. (London, 1949).

The modern study of the miracle stories in the Synoptic Gospels was initiated shortly after the end of World War I by such brilliant form critics as Martin Dibelius and Rudolf Bultmann. See a fascinating study by Dibelius, *Die Formgeschichte des Evangeliums*, 2d rev. ed. (Tübingen, 1933), translated by Bertram Lee Woolf as *From Tradition to Gospel* (New York, 1935). See also Bultmann’s admirable analysis of the miracle stories in his *Die Geschichte der synoptischen Tradition*, 3d ed. (Göttingen, 1958), translated by John Marsh as *The History of the Synoptic Tradition* (New York, 1963). More recently, Gerd Theissen has studied the miracle stories from the perspective of the sociology of literature. See his *Urchristliche Wundergeschichten: Ein Beitrag zur formgeschichtlichen Erforschung der synoptischen Evangelien* (Gutersloh, 1974), translated by Francis McDonagh and edited by John Riches as *The Miracle Stories of the Early Christian Tradition* (Philadelphia, 1983). David L. Tiede, in his very useful study *The Charismatic Figure as Miracle Worker* (Missoula, Mont., 1972), distinguishes between the aretalogy of the sage-philosopher and the aretalogy of the miracle worker. On Christian saints and their miracles, there is an excellent study by Peter Brown, *The Cult of the Saints: Its Rise and Function in Latin Christianity* (Chicago, 1981).

On Muḥammad’s reinterpretation of the concept *āyah* (“sign”), there is an admirable account by Toshihiko Izutsu, *God and*

Man in the Koran: Semantics of the Koranic Weltanschauung (Tokyo, 1964), pp. 133ff. Reynold A. Nicholson has written on Muslim saints and their miracles in his *The Mystics of Islam: An Introduction to Sufism* (1914; reprint, London, 1963), pp. 120–147. See also a fascinating account by Anne-Marie Schimmel, *Mystical Dimensions of Islam* (Chapel Hill, N.C., 1975), pp. 204ff.

MIRACLES: MODERN PERSPECTIVES

The attitude toward miracles in the Western world is a strange combination of belief and disbelief. Most of the Mediterranean cultures that laid the groundwork for Western thinking believed that human beings have two modes of coping with animate and inanimate reality. One is the ordinary way, the other the religious or miraculous way. (Most nineteenth-century Western anthropologists called the second way magical.) Humans act in the ordinary way when they use habit, conventional thinking processes, or acquired skills. When these methods fail, when humans cannot adequately deal with the physical world, or when other human beings are hostile or unchanged by threats, war, contracts, or persuasion, another option is available: they can seek the help and intervention of a spiritual or nonphysical dimension of reality, which exists alongside and interpenetrates the ordinary physical dimension. This supplication can be quite conscious or it can be performed unconsciously through actions that imply control over these powers. Help can be invoked through concentration, meditation, ritual, spell, or ecstatic trance. Aid can be sought for knowledge, protection, or deliverance. The spiritual powers called upon can be either beneficent, malignant, or neutral. When a result appears in response to such an action, a miracle is said to occur. The miracle may occur within an individual or in the external world.

Four different attitudes toward miracles are to be found in Western cultures at the present time. (1) Christianity's view, which has remained quite consistent from the teachings and practice of Jesus to the present time, holds that miracles are natural manifestations of God. (2) Rational materialism maintains that material reality accounts for all data of experience and infers therefrom that spiritual reality is an illusion and that miracles do not exist. This view has encouraged liberal Christianity to doubt the reality of the miracles found in the New Testament and to rule out the possibility of their happening at present. This view has influenced conservative Christianity as well, for conservatives believe that miracles did occur within the dispensation of God at the time of Jesus but that they do not occur now. (3) A resurgence of interest in and study of phenomena not accounted for within the framework of materialism constitutes yet another approach to miracles, which has recently engaged the scientific community. (4) A fourth attitude toward miracles prevails in Hinduism, Buddhism, and Western Christian Science. In this view, material reality is seen as illusion. A miracle occurs once an individual realizes this truth. This approach is increasingly popular in the West, for it provides an alternative to rational materialism.

CHRISTIANITY AND MIRACLE. Christianity is both a historical religion and a living one. The historic Christian faith is one of the few in which miracles are seen as constituent of the orthodox faith. It continues the Old Testament tradition of God acting powerfully in the physical world. As C. S. Lewis (1947) points out, historical Christianity sees the incarnation of God in the world as the greatest miracle that culminates in the crucifixion and resurrection. Through this invasion of God the powers of evil are defeated and the kingdom of heaven begins to manifest itself on earth. Reginald H. Fuller (1963) sees the New Testament miracles as signs of the breakthrough of the kingdom into the ordinary world, though he questions the historicity of most miracles.

I have shown in detail in *The Christian and the Supernatural* (1976) that the miraculous in the ministry of Jesus and the apostles described in the New Testament falls into six categories:

1. The most common miracles are physical and mental healings, from curing ailments like a fever (*Mk.* 1:30) to raising the dead.
2. Another class of miracles involves exorcism, or healing through the expulsion of a spiritual force causing mental or physical illness. Most mental and physical sickness was perceived not as the action of God but as the infiltration of negative spiritual powers at war with God, an infiltration that morally caused sin, physically caused disease, and mentally caused madness or possession.
3. The third category comprises communication with the spiritual world and with God through dreams, visions, revelations, or prayer. Such communication is a basic principle of the teachings and practice of Jesus.
4. Nature miracles comprise a fourth category. Examples

include Jesus walking on the water (*Mk.* 6:48), the stilling of the storm (*Mk.* 4:38), physical disappearance (*Lk.* 4:30), and the feeding of the multitudes (*Mk.* 6:35).

5. In another category of miracles Jesus shows telepathic, clairvoyant, and precognitive power (*Mk.* 2:6, *Jn.* 1:47, *Mk.* 11:1). Sometimes his statements are prophetic, as when he foretells his own death and resurrection, relates the destruction of Jerusalem, and speaks of the coming of the Kingdom.
6. In the final category of miracles are the resurrection appearances of Jesus, which combine both the physical and the spiritual in a religious experience that is dynamic and transforming.

Similar miracles are reported among the apostles after the ascension of Jesus in *Acts of the Apostles* and in other books of the New Testament. This tradition of miracles continued without interruption in both Roman Catholicism and Orthodox Christianity; services for healing and exorcism are found in the official service books of both. Writing during the fifth century, Sozomenos reports that miracles began to occur again at the end of the Arian controversy, when churches held by Arians were returned to Orthodox pastors (*Ecclesiastical History* 7.5). Throughout Christian history miracles have been reported to occur around saintly people. To this day several attested miracles are required by the Roman Catholic church before a saint is canonized.

During the Reformation, both Luther and Calvin wrote that the age of miracles was over and that their occurrence should not be expected. At the same time Protestantism was overwhelmed by the rationalism and materialism of the Enlightenment, and discussion of the miraculous nearly disappeared. The Roman Catholic church upheld its practice without trying to defend it intellectually, and shrines like Lourdes drew great crowds. The academic Protestant community came to believe that the practice of Christianity was largely a matter of morality and that neither God nor the spiritual world contacted or influenced practical human life to any great extent. Rudolf Bultmann presented this thesis consistently and thoroughly.

PHILOSOPHICAL MATERIALISM. Materialism as an adequate explanation for all things originated in the thinking of several classical Greek thinkers, was developed by Aristotle, and came to fruition in the eighteenth and nineteenth centuries. My book *Encounter with God* (1972) traces this development from its first beginnings to its full-blown denial of any aspect of reality not perceived by the five senses and not objectively verifiable. This view, diametrically opposed to the view of Hinduism and Buddhism, dominated the intellectual and academic life of the West in the nineteenth and early twentieth centuries and influenced nearly all disciplines from psychology and anthropology to comparative religion and Christian theology. In several books B. F. Skinner dismisses human consciousness as the ghost in the box. Melvin Konner in *The Tangled Wing* (New York, 1982) writes that there is

only the blind action of natural selection, sifting material genes. A person is only a gene's way of making another gene. This skeptical materialism has arisen many times in human history—in China, Greece, and Rome—but only recently has it effectively taken over nearly a whole culture.

This worldview considers all miracles and all contact with any dimension of reality other than the concrete physical one absurd, the result of ignorance, superstition, or the refusal to search long enough for the purely physical causes. Supposedly intelligent people will classify miracle with magic and ignore any experience purporting to be miraculous.

SCIENTIFIC STUDY OF PARANORMAL EXPERIENCE. Since the mid-twentieth century, when man succeeded in splitting the atom and the implications of Heisenberg's principle of indeterminacy and Einstein's theory of relativity were fully realized, theoretical physics has become much less certain that it can provide final answers. In *Physics and Philosophy* (New York, 1962) Werner Heisenberg suggests that we live in an open universe and that the conventional words describing God and spirit may have greater correspondence with reality than the highly developed words of physics. The mathematical thinking of Kurt Gödel, the analysis of scientific theory presented by Thomas S. Kuhn in *The Structure of Scientific Revolutions* (Chicago, 1962), the findings of psychosomatic medicine, the work of modern anthropologists, the data in Andrew Greeley's *The Sociology of the Paranormal: A Reconnaissance* (1975), the scientific study of parapsychological phenomena, and the theory underlying the depth psychology of C. G. Jung all cast doubt on Western materialist determinism.

In the heyday of materialism in London a group of serious scientists organized the Society for Psychical Research in 1882. An American society was organized three years later in which William James was active. Sigmund Freud was a member of the original society and contributed to its publications. Jung too studied and published on the subject of paranormal experience; he discussed synchronicity, mediumship, and telepathy and provided models for understanding these events. Joseph Banks Rhine at Duke University did many scientific studies of events that did not fit into the materialistic paradigm.

Finally, the professional organization calling itself the Parapsychological Association was accepted as an affiliate by the American Association for the Advancement of Science in 1969. One of the most comprehensive surveys of scientific parapsychology to date is that of Robert F. Jahn (1982). Jahn describes four categories of psychic phenomena; three of these are divided further. These categories are similar to the Christian ones. In the following outline, I have added explanations of the terms.

I. EXTRASENSORY PERCEPTION (ESP)

- A. Telepathy: information passing from mind to mind without physical means
- B. Clairvoyance: perception of events or happenings at a distance in space

- C. Precognition/Retrocognition: perception of events in future time or past time

D. Animal ESP

II. PSYCHOKINESIS (PK): THE AFFECT OF MIND OR PSYCHE OR SPIRIT ON A MATERIAL ENVIRONMENT

A. Physical Systems

1. deliberate, actually effected by conscious intent
2. spontaneous, as in poltergeist phenomena

B. Biological Systems

1. psychic healing
2. plant PK

III. SURVIVAL: EXPERIENCES OF THE DECEASED

- A. Reincarnation: evidence of a former life of the individual

- B. Apparitions: experience of the person deceased or spiritual reality

- C. Mediumship: using others to make contact with this nonphysical domain

IV. OUT-OF-BODY EXPERIENCES (OOBE): THE EXPERIENCE OF HAVING EXISTENCE AS A PSYCHE, BUT NO LONGER TIED TO THE PHYSICAL BODY.

Once it is acknowledged that human beings can receive verifiable information through means other than the five senses and that this reception breaks the rules of space and time, the serious scientific study of miracle becomes possible. It becomes possible to examine critically data that are not easily verifiable, such as communication from the deceased and the transformative power of religious experience. A strict materialistic framework considers communication through nonphysical means as absurd as a miracle, because it assumes that some physical signal has to enter the closed system and move the cogs so that the message can get through. An alternate theory of perception is required to avoid such an impasse.

Since the first decade of the twentieth century the medical profession has come to realize that a materialist point of view cannot explain or heal all human disease. Both James and Jung point out that the experience of meaninglessness is a disease causing both emotional and physical sickness. In *The Broken Heart* (1977) James J. Lynch describes the medical consequences of loneliness and calls organized religion to task for not providing ways to meet this human need, which is largely ignored in a mechanistic, materialistic society. O. Carl and Stephanie Simonton have described a meditative treatment for cancer in *Getting Well Again* (1978). Herbert Benson describes what he calls the faith factor in *Beyond the Relaxation Response* (1983).

In *The Structure and Dynamics of the Psyche* (1960), Jung presents a theory of synchronicity developed in conjunction with the Nobel Prize-winning atomic physicist Wolfgang Pauli. He offers a hypothesis as to how events can be influenced both by physical causality operating within the materi-

al world and by other forces as well. Jung never denied physical causality, but he concluded that it could not explain all happenings, a conclusion also reached by other scientists. Those events not explainable in purely causal terms Jung called acausal or synchronous. In his theory each instant of time contains meaning; there is a coherence in each period of duration, and these coherences have their source in the nonphysical, psychoid, or, in Christian terminology, the spiritual aspect of reality. The Chinese call this the Dao, and the Chinese book of oracles, *I ching*, is based upon this principle. Miracles exemplify synchronous events. In oracular information, dream interpretation, religious experience, healing, and nature miracles the synchronous appears autonomously or through mediation.

The most recent studies seem to suggest that the issue of miracle or paranormal experience remains an open question in the Western world.

MORTON KELSEY (1987)
Revised Bibliography

MI'RĀJ. The belief that Muḥammad ascended to heaven in the course of his life and beheld the secrets of the otherworld as no other person had ever beheld them is shared by all factions of Islam. In Muslim religious literature, the idea of the Mi'rāj, Muḥammad's ascension to heaven, is closely associated with that of the Isrā', his nocturnal journey. Neither term appears as such in the Qur'ān, yet both developed in close connection with crucial, though ambiguous, Qur'anic passages.

QUR'ANIC ASSOCIATIONS. The term *isrā'* is taken from surah 17:1, "Glory be to him who carried his servant by night from the Holy Mosque to the Further Mosque, the precincts of which we have blessed, that we might show him some of our signs." It is reasonably certain that "his servant" refers to Muḥammad, "the Holy Mosque" to Mecca (*sūrah*s 2:144, 2:149, 2:150, 2:191, 2:196, 2:217, 5:2, 8:34, 9:7, 9:19,

9:28, 22:25, 48:25, 48:27), and “by night” to a journey begun by night (44:23), without reference to the journey’s miraculous nature. Far less certain, however, is the intended meaning of “the Further Mosque” (*al-masjid al-aqṣā*). Since the earliest prophetic traditions (*ḥadīth*), this term has been explained either as a sanctuary on earth (“terrestrial” Jerusalem, the temple precinct) or in heaven (“celestial” Jerusalem, the environs of the divine throne). There is no apparent connection between the *isrāʾ* verse and a dream (*ruʾyā*) shown to Muḥammad by God and mentioned in the same *sūrah* (17:60), although the *ḥadīth* would interpret this dream as a vision of Jerusalem that Muḥammad communicated to the unbelieving Meccans.

The association of “the Further Mosque” with the terrestrial Jerusalem, which became the most widely accepted explanation, seems to be supported by the Qurʾanic phrase “the precincts of which we have blessed,” referring to the Holy Land (21:71, 21:81, 7:137, 34:18), although Palestine in general is referred to as the “nearer part of the land” (30:3). This explanation was favored under the Umayyads, who were intent on glorifying Jerusalem as a holy territory rivaling Mecca, then ruled by their opponent ʿAbd Allāh ibn Zubayr. The interpretation of “the Further Mosque” as al-Jiʾrānah, a place on the fringes of the holy precinct of Mecca from which Muḥammad set out on his pilgrimage (*ʿumrah*) of Dhū al-Qaʿdah 630, has been rejected on decisive evidence (Maurice Plessner, “Muḥammad’s Clandestine ʿUmra in the Dhū-l-Qaʿda 8 H. and Sūra 17,1,” *Revista degli studi orientali* 32 [1957]: 525–530; Rudi Paret, “Die ‘ferne Gebetsstätte’ in Sure 17,1,” *Der Islam* 34 [1959]: 150–152).

The association with the celestial Jerusalem was favored in the classical sources of *ḥadīth* and Qurʾān commentary, which tended to use *isrāʾ* for the ascension to heaven and thus linked Muḥammad’s night journey with his ascension. This explanation, which also included the purification of Muḥammad’s heart as a preparatory stage, tended to interpret the story as Muḥammad’s divine initiation to his prophetic career.

As a term for ascension, the word *miʾrāj*, literally “ladder,” appears to conceal a vaguely understood reference to Jacob’s ladder (*Gn.* 28:12). The term was probably borrowed from the Ethiopic *maʾāreg* (*Ethiopic Book of Jubilees* 21:37) as a translation of the Hebrew *sullām*. The background for the cryptic references in the Qurʾān may be provided by various motifs: the apocalyptic images of a heavenly ladder that recur in Jewish *heikhalot* literature; symbolic notions of a seven-runged ladder on which the soul ascends through the gates of heaven, found in the liturgy of Mithras; and gnostic ideas of the ladder as a means of ascending to heaven, as in the Mandaean *sumbilita* and the Manichaean pillar of glory.

In fragmentary Qurʾanic references, God is called “the Lord of the Stairways” (*dhū al-maʿārij*, 70:3; see also 43:33, 40:15), to whom the angels, the spirit, and the divine command “mount up” (*taʾruju, yaʾruju*) in a day (70:4, 32:5). God knows what comes down from heaven and what goes

up to it (34:2, 57:4). The notion of heavenly ascent appears to be implied when Pharaoh gives orders to build a tower so that he may reach the cords of heaven and climb up to the god of Moses (40:36–37), or when Muḥammad is challenged by his opponents to go up into heaven (17:93). To this he replies, “Let them ascend the cords” (38:10) and “Stretch up a rope to heaven” (22:15), for even if God opened to them “a gate in heaven” (15:14), or if they had “a ladder” into heaven (*sullām*, 52:38, 6:35) and were climbing to it (6:125), they would not believe.

Three Qurʾanic passages not explicitly referring to heavenly ascent appear nevertheless to be linked with Muḥammad’s visionary experiences of heaven. *Sūrahs* 81:19–25 and 53:1–12 give a parallel account of a vision in which Muḥammad saw a divine messenger on the horizon, and *sūrah* 53:13–18 gives an account of a vision in which he beheld the greatest signs of God near the lote tree on the edge of Paradise. In both cases the heavenly messenger approaches the Prophet from a distance but does not carry him off.

On the basis of the Qurʾanic evidence it appears certain that *miʾrāj* and *isrāʾ* refer to experiences Muḥammad had prior to his emigration from Mecca to Medina in 622, since the relevant Qurʾanic passages can be traced back to that period. It cannot be ascertained, however, whether or not these experiences occurred toward the beginning of Muḥammad’s prophetic activity in Mecca, although they seem to have their natural setting in that time.

NARRATIVE LORE. The Qurʾanic references became associated with legends that proliferated rapidly during the first two centuries of Islam through the activity of the *quṣṣās*, pious and popular storytellers. Their stories in turn were taken up and recast in the *ḥadīth* methodology of the Prophet’s biography (*sīrah*) with the aim of establishing a scholarly consensus (*ijmāʿ*) concerning this legendary and mainly oral tradition. This consensus, reflected in the *Sīrat Muḥammad* by Ibn Ishāq (d. 767), revised by Ibn Hishām (d. 834), admitted both interpretations of “the Further Mosque” and harmonized the two by assigning *isrāʾ* the particular meaning of the nocturnal journey to Jerusalem. This harmonization implied the elimination of an earlier tradition that made Mecca the starting point of the ascension and the substitution of Jerusalem, the starting point of Christ’s ascension, where, perhaps since ʿAbd al-Malik’s caliphate (685–705), the Prophet’s footprint was shown to Muslim pilgrims.

Sīrat Muḥammad. Ibn Ishāq’s account of the miraculous events occurring during a single night combines all features in a continuous narrative, yet inverts the events. One night Muḥammad is asleep near the Kaʿbah at Mecca (or in the house of Umm Hāniʾ) when he is awakened by the angel Gabriel, who leads him to a winged animal called Burāq. Gabriel places the Prophet on the back of this steed, and they journey together to Jerusalem. In Jerusalem they meet several prophets, notably Abraham, Moses, and Jesus. By leading a public prayer service (*ṣalāt*), Muḥammad takes precedence

over all the other prophets assembled there. When the Prophet finishes all that has to be done in Jerusalem, so the narrative continues, the beautiful ladder (*mi' rāj*) on which the dying fix their eyes, and which the human souls ascend to heaven, is brought. Gabriel makes Muḥammad ascend it and brings him to the gates of the seven heavens, one after the other. At each gate Gabriel is asked to identify Muḥammad and testify that revelation has already been made to him. Then follows a long description of Muḥammad's experiences in the heavens, in each of which he meets one of the prophets. Finally, Muḥammad beholds the garden of Paradise (as, from the first heaven, he has witnessed the tortures of Hell) and appears before God's throne to converse with him. God then reduces the number of obligatory daily prayers incumbent on the Muslim community from the original fifty to five. Muḥammad returns to Mecca and the next morning informs the Meccans that during the night he has gone to Syria and come back again. The public, including his close companion Abū Bakr, is naturally skeptical at first, and many of the Prophet's followers apostatize.

Hadīth. Influenced in part by the Jewish and Christian apocalyptic traditions, *hadīth* literature embellished the basic narrative of the Prophet's ascent to heaven with a great variety of detail that focused on the preparation for the ascent, the riding animal, and the experiences in heaven. It was also at this point that the story of the purification of Muḥammad's heart was prefixed to the ascension narrative. As Muḥammad is sleeping in the neighborhood of the Ka'bah, angels appear, lay him on his back, open his body, and, with water from the well of Zamzam, wash his heart and bowels, cleansing them of doubt, idolatry, ignorance, and error. They then bring a golden vessel filled with wisdom and belief and fill his body with faith and wisdom. Purified in his heart and dedicated to be a prophet, Muḥammad is taken up to the lowest heaven.

The animal that carries Muḥammad to Jerusalem, Burāq (etymologically probably Arabic, "little lightning flash"), is depicted as a miraculous beast of exceptional fleetness. It is described as a brilliant steed of either gender, saddled and bridled, in size between a donkey and a mule, with a long back, shaking ears, and "a cheek like that of a man." Wings on its shanks propelled legs that moved in one stride as far as its eyes could reach. It was the riding beast of prophets in the past, Abraham in particular, and more recently Jesus. Upon the arrival in Jerusalem, according to some traditions, Gabriel tied it to a rock or ring, while, according to others, Burāq served as a flying steed for Muḥammad's ascension, taking over the function of the ladder. In its pictorial representations Burāq received a human face, a woman's head, and a peacock's tail. From the earliest extant image in a 1314 manuscript of Rashīd al-Dīn's Jamī' al-tawārikh (Universal history) to the most splendid Persian and Turkish miniatures of later centuries, the steed, its rider, and its guide became a highly cherished motif of Islamic painting

and poetry. Beautiful miniatures of Muḥammad's *mi' rāj* can be found, for example, in the fifteenth-century *Mi' rāj-nāmah* translated into Eastern Turkish by Mīr Ḥaydar and calligraphed in Uighur script by Mālik Bakhshī of Herat (see Marie-Rose Séguy, *The Miraculous Journey of Mahomet*, New York, 1977).

The meeting of the Prophet with Abraham, Moses, and Jesus at Jerusalem may be modeled on accounts of the transfiguration of Jesus on Mount Tabor (*Mt.* 17:1, *Mk.* 9:1, *Lk.* 9:28). Muḥammad encounters Adam as judge over the souls of the dead in the first heaven, Joseph in the third, and Enoch/Idrīs in the fourth. Jesus and John the Baptist appear together in the second heaven, whereas Aaron and Moses appear separately in the fifth and sixth. Moses weeps, realizing that Muḥammad is higher than himself in God's esteem and that his followers will be more numerous than his own. Muḥammad refuses his advice to ask God to reduce the obligatory daily prayers to fewer than five. Finally, in the seventh heaven, that of Abraham, Muḥammad finds himself in the presence of God's throne, reaches the lote-tree marking the limit of knowledge that creatures possess, and beholds the rivers of Paradise, where he is offered vessels of water, wine, milk, and honey but partakes of the milk alone.

ADAPTATIONS AND INTERPRETATIONS. The theme of the Prophet's ascension found its place in the literature of Islamic theology, philosophy, and Sufism. Muslim theologians were preoccupied with the question, already discussed since early times, of whether the night journey and ascension took place in a literal or a spiritual sense. Al-Ṭabarī (d. 923) strongly favored the belief, shared by the majority of Muslims, that the Prophet was transported literally, with his body and while awake. Others, in particular the Mu'tazilah, held that he was carried in spirit to Jerusalem and heaven while his body remained at Mecca; this view was supported by a statement attributed to Muḥammad's favorite wife, 'Ā'ishah. Al-Taftāzānī (d. 1389) states that the event happened in body and spirit but does not rule out its possible occurrence in sleep or in spirit alone. The question of whether or not Muḥammad saw God face to face on the occasion of the ascension constituted another debate within Islamic theology, in particular against the background of the controversy concerning the beatific vision of the believer.

The Neoplatonic philosophers of Islam gave an allegorical meaning to the Prophet's ascension. The *Epistles* of the Ikhwān al-Ṣafā' (Brethren of Purity), completed in 969, adopted the pattern of cosmological descent and eschatological ascent and interpreted the latter as the ascent (*mi' rāj*) of the human soul that abandons its bodily existence and returns to its angelic state of pure spirituality. Abū al-'Alā' al-Ma'arrī (d. 1057) wrote a parody, *Risālat al-ghufrān* (The epistle of forgiveness), on the traditional accounts of the *mi' rāj*. Two treatises of al-Ghazālī (d. 1111) are focused on the theme of ascension: his *Mi' rāj al-sālikīn* (The ladder of those who follow the path) elucidates the theme from seven different topical angles, while his *Mishkāt al-anwār* (The

niche for lights) offers a Neoplatonic interpretation in purely psychological terms. Ibn al-Sīd al-Baṭalyawī (d. 1127), in his *Kitāb al-ḥadā'iq* (Book of gardens), describes the ascent of the purified spirits to the supernal world on “the ladder of ascensions” (*sullam al-ma'ārij*) that follows a straight line connecting the terrestrial and celestial spheres.

For the Ṣūfīs, the night journey and ascension of the Prophet became the prototype of the soul's itinerary to God as it rises from the bonds of sensuality to the height of mystical knowledge. It is doubtful whether, as is frequently asserted, Abū Yazīd al-Bisṭāmī (d. 875) claimed to have experienced *mi' rāj* himself, leading to mystical union with God. Al-Ḥallāj (d. 922) meditated on the theme in his *Kitāb al-tawāsīn*. Al-Qushayrī (d. 1074) collected accounts current among moderate Ṣūfīs in his *Kitāb al-mi' rāj* and included in it a discussion of the ascension attributed to Enoch/Idrīs, Abraham, Elijah, Moses, and Jesus. He reserved ascension in body and spirit for the prophets and conceded to the Ṣūfīs only the dream experience of ascent to heaven. Al-Hujwīrī (d. 1077) makes a clear distinction in his *Kashf al-mahjūb* (Elucidation of the secrets) between the ascension of prophets, which occurs outwardly and in the body, and that of the saints, which takes place inwardly and in the spirit only. Ibn al-ʿArabī (d. 1240) expounded the Prophet's night journey and ascension as a symbol of the soul's itinerary toward mystical union in his *Kitāb al-isrāʾ* and also devoted two lengthy sections of his *Futūḥāt* (Revelations) to the subject. In one section he has a mystic and a philosopher make the journey together; the philosopher has to stop short at the seventh heaven, while no secrets remain hidden from the mystic. In the other section applies the Prophet's ascension to the mystical experience of Ṣūfī ecstasy, recording his own mystical ascent and his conversations with the prophets about mystic themes.

The *Mi' rāj* provided an ideal type for the symbolic narratives created by Ṣūfī philosophers and poets intent on explaining the spiritual heights of mystical union. In the fine Persian *Mi' rāj-nāmah*, attributed to Ibn Sīnā (d. 1037) or Yaḥyā Suhrawardī (d. 1191), yet probably written by an anonymous eleventh-century author, the theme of the post-mortem ascent of the soul to heaven under conduct of the angel is overshadowed by the ecstatic ascent of the mystic to the divine throne in imitation of the ascension of the Prophet, the archetypal mystic. This symbolic narrative may be understood, topically although not historically, as bridging the gulf between Ibn Sīnā's Arabic allegory, *Ḥayy ibn Yaqẓān*, and ʿAṭṭār's (d. 1220) grandiose mystical Persian epic, *Mantiq al-tayr* (Conversation of the birds), both of which, in their respective ways and not unlike the Persian *Mi' rāj-nāmah*, move from the level of the symbolic interpretation of the narrative to the plane of the existential exegesis of mystic ascent experienced in the human soul.

The theme of *mi' rāj* appears in many aspects in Persian Ṣūfī poetry from Rūmī (d. 1273) to Iqbal (d. 1938). For Rūmī the *Mi' rāj* became the symbol of the radical difference

between discursive reason and mystical union. Gabriel, the symbol of reason and the guide of the heavenly journey, remains outside the divine presence while the Prophet, the symbol of the true lover of God, enjoys “a time with God” in the chamber of union and mystery. The *Jāwīd-nāmah* of Iqbal describes a contemporary version of the spiritual journey made by the poet from earth through and beyond the spheres to the presence of God.

Later popular accounts of the Prophet's ascension collect and systematize the material scattered in the older sources, largely augmenting the matter without increasing its depth. Al-Suyūṭī (d. 1505) presents a fine disquisition on the traditions of *isrāʾ* and *mi' rāj*, discussing their nature, time, place, and details in *Al-āyah al-kubrā fī sharḥ qiṣṣat al-isrāʾ*. Al-Nu'mānī, a disciple of Ibn Ḥajar al-ʿAsqalānī (d. 1449), collects a medley of traditions, theological views, and mystical statements concerning the Prophet's night journey and ascension in *Al-sirāj al-wahbāj* (The glowing lamp). The most popular *mi' rāj* book down to modern times is the *Kitāb al-isrāʾ wa-al-mi' rāj* of al-Ghaythī (d. 1573), on which Dardīr (d. 1786) wrote a gloss. Al-Barzanjī's (d. 1766) *Qiṣṣat al-mi' rāj* appears to be modeled on al-Ghaythī's work. The Uighur *Mi' rāj-nāmah*, composed in 1436/7, documents the spread of the legend in Central Asian languages.

The Christians of the Middle Ages possessed a certain knowledge about the Muslim legends surrounding Muḥammad's miraculous journey to heaven. This is evidenced by the famous Latin version of the legend, apparently prepared by Ibrāhīm al-Ḥakīm, a Jewish physician active at the court of Alfonso X of Castile (1264–1277). This Latin version (*Liber scalae*) and a French translation from Latin (*Eschiele Mahomet*) became the focal point of the discussion surrounding the question of Dante's Muslim sources in his *Commedia* (raised by the Spanish Jesuit Juan Andrès about 1780, again advanced by Ozanam in 1838 and Labitte in 1842, and clearly formulated by Blochet in *Les sources orientales de la divine comédie*, Paris, 1901).

BIBLIOGRAPHY

Historians of religions have long realized the significance of Muḥammad's ascension as a theme in comparative religion. D. W. Bousset's groundbreaking study “Die Himmelsreise der Seele,” *Archiv für Religionswissenschaft* 4 (1901): 136–169, 229–273, set the stage for an inquiry into the soul's ascent to heaven in world religions. Following Bousset's line of research and Edgar Blochet's study of the theme in “L'ascension au ciel du prophète Mohammed,” *Revue de l'histoire des religions* 40 (1899): 1–25, 203–236, Geo Widengren has traced the Iranian motifs of Muḥammad's *Mi' rāj* in two works, *The Ascension of the Apostle and the Heavenly Book* (Uppsala, 1950) and *Muḥammad, the Apostle of God, and His Ascension* (Uppsala, 1955), which attempt to establish an “ideal” ritual of the Prophet's ascension. Marie-Thérèse d'Alverny documents the theme of the soul's ascent in Latin sources of medieval philosophy in “Les pérégrina-

tions de l'âme dans l'autre monde d'après un anonyme de la fin du douzième siècle," *Archives d'histoire doctrinale et littéraire du Moyen-Âge* 15–17 (1940–1942): 239–299, while Alexander Altmann demonstrates the impact of Muslim sources on the theme of the ascension in Jewish religious philosophy in "The Ladder of Ascension," *Studies in Mysticism and Religion Presented to Gershom G. Scholem*, edited by E. E. Urbach, R. J. Zwi Werblowsky, and Chaim Wirszubski (Jerusalem, 1967), pp. 1–32. The problems of typological similarity between Muḥammad's Mi'rāj and shamanic experiences of ascension are outlined by Mircea Eliade in *Shamanism* (New York, 1964) and taken up by J. R. Porter in "Muḥammad's Journey to Heaven," *Numen* 21 (1974): 64–80.

The question of Muslim sources in Dante's *Commedia* has been treated systematically by Miguel Asín Palacios in his important work *La escatología musulmana en la Divina comedia* (Madrid, 1919), translated and abridged by Harold Sunderland as *Islam and the Divine Comedy* (New York, 1926). The controversy Asín Palacios's book stirred up is recorded in the second Spanish edition (Madrid and Granada, 1943). The basis of the discussion was significantly broadened with the independent publication of the French and Latin versions of the legend: *Il "Libro della scala" e la questione delle fonti arabo-spagnole della Divina comedia*, edited by Enrico Cerulli (Vatican City, 1949), and *La escala de Mahoma*, edited by José Muñoz Sendino (Madrid, 1949). The trends of more recent discussion on the point can be traced in Peter Wunderli's survey "Zur Auseinandersetzung über die muslimischen Quellen der Divina Commedia," *Romanistisches Jahrbuch* 15 (1964): 19–50, and Enrico Cerulli's *Nuove ricerche sul Libro della scala e la conoscenza dell'Islam in Occidente* (Vatican City, 1972).

GERHARD BÖWERING (1987)

MIRIAM, or, in Hebrew, Miryam; Israelite prophetess who flourished, according to tradition, in the thirteenth century BCE. Biblical tradition recalls Miriam as the sister of Moses and Aaron who helped Moses lead the Hebrew slaves out of Egypt (*Mic.* 6:4). *Exodus* 15:20–21 describes how she led the women of Israel in a hymn of victory to YHVH, Lord of Israel, after he had split the Sea of Reeds, enabling the Hebrews to pass through and escape their Egyptian pursuers:

Miriam the prophetess, sister of Aaron, took the drum in her hand. All the women went out after her with drums and dances. Miriam declared to them: "Sing to the Lord, for he has triumphed; horse and its rider he has hurled into the sea."

Modern scholars now tend to view the sibling relationships between Miriam, Aaron, and Moses as an embellishment on earlier traditions. Miriam was originally identified as an associate of Aaron, Israel's first priest, and later as his sister. When biblical tradition similarly developed a sibling relationship between Aaron and Moses, the great leader, prophet, and lawgiver of Israel, Miriam became known as the sister of Moses too (*Nm.* 26:39). In the story of Moses' birth (*Ex.*

2:2–7), the unnamed older sister who guards him is assumed by Jewish and Christian tradition to have been Miriam. If her name were of Egyptian origin, as some have explained, that would reinforce the conclusion that she was of the priestly tribe of Levi, as several prominent Levites bore Egyptian names.

Miriam figures primarily in one episode in the Pentateuch, *Numbers* 12:1–16, in which she and Aaron reproach Moses for having taken a Cushite wife—who may or may not be identified with his Midianite wife, Zipporah—and in which they challenge the superiority of Moses' prophetic stature to their own. YHVH responds to their challenge by asserting the unique and intimate nature of his revelations to Moses and responds to their reproach by afflicting Miriam with leprosy. Moses intercedes on Miriam's behalf at Aaron's request—thereby demonstrating his intimacy with God—and after a seven-day quarantine, Miriam's health is restored. The legendary quality of the episode is suggested by the fact that Miriam's leprosy became an admonition to any who would fail to heed the priests (*Dr.* 24:8–9). Miriam predeceased Aaron and Moses (*Nm.* 20:1) and, so far is known, never married.

The references to Miriam's leadership in *Micah* 6:4, to her prophetic status in *Exodus* 15:20, and to her importance to the Israelites in *Numbers* 12:15, create the impression that Miriam was an even more significant figure than the present form of the Pentateuch suggests. According to rabbinic legend, Miriam was on par with Moses and Aaron. The Israelites were sustained by water drawn from Miriam's well, which traveled with the Israelites on their journey in the wilderness.

- On the difficulty of establishing Miriam's historical position, see Martin Noth's *A History of Pentateuchal Traditions*, translated with an introduction by Bernhard W. Anderson (Chico, Calif., 1981), pp. 180–183. Miriam is most extensively discussed in connection with the challenges to Moses, for analysis of which see G. B. Gray's *A Critical and Exegetical Commentary on Numbers* (Edinburgh, 1903), pp. 120–128. The most exhaustive, but a very technical, analysis is Heinrich Valentin's *Aaron: Eine Studie zur vor-priesterschriftlichen Aaron-Überlieferung* (Göttingen, 1978), pp. 306–364; Valentin also discusses (pp. 377–384) *Exodus* 15:20. Martin Buber's *Moses: The Revelation and the Covenant* (New York, 1958), pp. 167–169, attempts to connect the two challenges to Moses. On Miriam's name, see Alan H. Gardiner's "The Egyptian Origin of Some English Personal Names," *Journal of the American Oriental Society* 56 (1936): 189–197, esp. pp. 194–197.
- On the apparently suppressed significance of Miriam, see Phyllis Trible, "Bringing Miriam out of the Shadows," *Bible Review* 5/1 (February 1989): 14–25, 34. Rabbinic lore on Miriam's well is gathered in Louis Ginzberg's *The Legends of the Jews*, vol. 3, translated by Paul Radin (Philadelphia, 1911), pp. 50–54, 307–308.

EDWARD L. GREENSTEIN (1987 AND 2005)

MIRRORS. Object and symbol, instrument of knowledge and type of reflection or speculation (the Latin word for mirror is *speculum*), means of visual perception and hallucination: there is scarcely a single culture that has not been interested in the mirror, first in its primitive form—a bowl filled with water, a sparkling stone (jade, obsidian)—then in more elaborate guise—polished metal discs (bronze, silver, or steel), a mirror of balloon-shaped mediaeval glass—and, finally, in the form of the plane mirror, clear as rock crystal. Because it reflects an image of the self that the eye is unable to see directly, because it traps light, because the effect of the reflection is to reveal an unseen “other,” and because it faithfully reproduces its subject while making it seem different—that is, reversed—religions have made the mirror central to the mystical life and knowledge of self.

What is the nature of that which can be learned from a mirror? It can be used in divination, metaphor, analogy, or mimicry. In the West, meditation on the mirror image originates with Plato. Before him, the reflected image was seen as a living animate form, the double that attracted Narcissus from beneath the surface of the water. One can see this myth in its original form as expressing ancient beliefs in the existence of a double or in the idea of the soul taking shape, concepts still found in primitive cultures up until the present day. It was not until the philosophy of Classical Greece had reached a certain stage of development that the reflection came to be seen as a flimsy illusion, a snare.

COSMIC PROCESS AND MYSTIC EXPERIENCE. Is the reflection in the mirror merely a deceitful trick? According to Plato, it has another function: by producing an immaterial form, it invites the mind to free itself from what is perceived by the senses and to ascend to the world of ideas. Although itself devoid of reality, a reflection provides access to the thing it signifies. It is not an optical illusion but a revelation of something hidden, an apparition rather than an appearance. Pausanias says that a mirror adorned the entrance of the temple of Lycosoura in Arcadia, and that anyone who looked in it before entering the sanctuary saw a reflection unlike any they had seen before. Thus they had to shed their appearance and assume a new identity.

According to the Neoplatonists, what is produced by the world of the senses comes about in the way that a mirror “creates” reflections. Plotinus (*Enneads* 4.3) regards the world of the senses as a mirror image emanating from the world of eternal forms, and the body as a reflection that the soul produces when it comes into contact with matter, in the same way as a human being produces a reflection when facing a polished surface: the spiritual exercise or mystical experience consists of once again ascending from the light of the body to the earlier light, without allowing oneself to be mesmerized by an illusion (like Narcissus).

Christian thinking, derived from Judaism and infused with Neoplatonist thought, has developed the concept of the symbolic double to explain the resemblance of the human being to God and the indirect knowledge of God that can

thus be obtained through analogy. According to *Genesis*, God created man in his image and likeness. The soul is a reflection of the beauty of God, but because sin has made the mirror darken, one must look in the mirror of the Bible, a book and a mirror without blemish, to restore the likeness that has been lost. The mirror is also a model of knowledge. According to Saint Paul (*1 Cor.* 13:12), the knowledge that mankind has of God here on Earth is like an image “seen through a glass darkly”: the mirror gives no more than an indirect image of the Truth. At the end of time, however, humans will see the vision of God not through the intervening reflection, but clearly, face to face. In mystical experience, the mirror is the juncture point where the visible face sees its invisible face: “We shall be like God, because we shall see him as he is,” says Saint John (*1 John* 3:2). Teresa of Ávila describes this union in the mirror: “My entire soul appeared before me like a clear mirror, back, top and bottom, everything was lit up. In the center appeared Jesus Christ” (*Autobiography*, ch. 49). Faithful and flexible, the mirror no longer indicates a different vision but the receptive nature of the person who gazes into it.

Islamic mysticism, inspired by Neoplatonism, has not ignored the reflection, that likeness by which individual essence sees itself as part of the divine being. If the body is the dark reflection in the mirror, writes the Persian poet Farīd al-Dīn ‘Aṭṭār, the soul is the “clear one.” According to a famous *ḥadīth*, the more the reflective surface of the soul is purified by asceticism, the more it will be fit to reproduce the truth faithfully, so that the believer actually becomes a mirror for another believer. As Louis Massignon and Louis Gardet point out in *Mardis de Dar-el-Salam* (1951), the back-to-front image of the face reflected in the mirror is a symbolic indication of one who has been straightened out, in accord with his essential reality. For Ṣūfīs, the entire universe is an array of mirrors in which the eternal essence may be gazed upon in many forms, all emanations of the One Being.

The Far East has developed a rich mythology concerning the reflective power of mirrors. According to a Chinese tradition going back to the third century BCE, the divine intelligence that is symbolically identified with the sun is reflected in a mirror that is circular in shape—but the mirror is also a lunar symbol, because the moon reflects the light of the sun. Huge vats filled with water were used to attract sunlight, a method subsequently replaced by the use of bronze mirrors. The idea of a link between the mirror and the sun became widespread in Japan around about the first century CE. A well-known Japanese myth describes how the goddess Amaterasu, the Divine Light, retreated into a cave following some wrongdoing by her brother, plunging the Earth into darkness. The gods arranged a ceremony, and when the goddess was attracted by this and appeared at the entrance of the cave, she saw her image reflected in a mirror that had been set up by another god. Surprised at the existence of another similar goddess, she leaned out of the place where she had retreated far enough to be seized. The cave was sealed shut behind her and she lit up the world.

Buddhism has made “mirror knowledge” one of the four stages of the path of Awakening, along with three other kind of knowledge: of equality, of clear-sightedness, and of the task to be completed. The mirror is used metaphorically in the Mahāyāna literature to suggest that Reality contains everything in the same way that a mirror contains images. The images in the mirror are clear and distinct; although not unreal, they are nonetheless not taken as real, because they cannot be grasped. Having obtained knowledge of mirrors, the consciousness of the *bodhisattva* no longer involves a division of subject and object, but becomes a clear omniscient consciousness, capable of reflecting images of everything in the universe, while also being one with what it reflects. With an understanding of universal equivalence based on the recognition of the emptiness of all things, and with the achievement of clear-sightedness concerning the nature most appropriate to each thing, the *bodhisattva*, having achieved awareness of the mirror, the peak of the mystic life, reaches Awakening. There is no more intention, no more projection; consciousness merges with the mirror. Consciousness, according to Asaṅga, is “a mirror, because in it there appear reflected images, delights, buddha-ness and knowledge” (*Mahāyānasūtrālamkāra* 9:69).

MAGIC MIRRORS AND DIVINATION MIRRORS. The shining brilliance of the reflective surface gives rise to all kinds of hallucinations and lends itself to divination: like dreams, mirrors can reveal what is not visible. Divination by mirror (or catoptromancy), which originated in Persia, is described in many texts. In the *Oneirocritica* (translated as *The Interpretation of Dreams*), for example, the Greek Artemidorus Daldianus (second century CE) devotes several paragraphs to the art of reading the future in mirror images. The magical use of mirrors to learn the future, namely, to know if one will have a long life, is frequently mentioned in European folklore. In central Asia, shamans practiced divination by mirror by pointing mirrors toward the sun or moon, which were themselves considered as mirrors in which was reflected everything that took place on Earth. In the Congo, soothsayers sprinkled reflective surfaces with kaolin (a fine, usually white, clay) in order to question the spirits.

The belief that reflections could reveal secrets rested in turn upon an ancient belief in the existence of a double. This mysterious spiritual double, as close as possible to the bodily self, was a representation of the idea of the soul and offered the possibility that one could deny death by splitting in two. Yet whereas the double guaranteed immortality and implied fertility, it also continually reminded a human being of the end; it was the specter of repressed death. In ancient Greece, for example, looking at one’s reflection or seeing it in a dream could lead to death or be a premonition of death. An old European tradition requires that mirrors in the house of someone who has died be covered, to prevent them from absorbing the soul and forcing the deceased to remain on Earth. The fear of having one’s portrait painted or photograph taken, widespread all over the world, stems from the

same concern: the soul represented by its image may be imprisoned by a stranger and subjected to evil spells.

Containing both the potential for harm and beneficent power, the mirror is regarded ambivalently in every culture. Small children are stopped from looking into the glass in case the sight of their reflection brings them bad luck; pretty girls who look at themselves see the devil suddenly appear; anyone looking at themselves at night risks losing their reflection, and anyone losing their reflection loses their creative force. In the Christian West, the mirror of God could become the mirror of the devil—something produced by the fear of death. Like all magicians, those who practiced magic with mirrors were persecuted by the Inquisition: in 1326 Pope John XXII excommunicated “those who have made a pact with Hell, manufacturing a mirror to secure demons.” Daoists believe a mirror reveals evil influences and that one may protect oneself by placing a mirror over the door of a house. In the Middle Ages, Christian pilgrims sewed small mirrors into their hats in order to absorb grace from relics that were exposed during processions. Because of what water and mirrors have in common, the Bambara people use mirror fragments or cups of water to make rain fall. In China, a mirror is a sign of harmony and fertility, but a broken mirror means that a separation will occur, particularly in marriage. The mirror has an important place in marriage ceremonies: in modern India, the couple, instead of looking at each other directly, exchange looks in a mirror hung at the far end of the room and see their faces looking up, as they will be in eternal life.

MIRROR AND SELF-KNOWLEDGE. From the start of the common era onward, mythological tradition concerning the mirror has given rise to philosophical commentaries, focused not so much on revealing a universal process as on describing a moral and spiritual condition: the disorder in the minds of those who allow themselves to be bewitched by their own reflections. The misfortune of Narcissus lies in his inability to love someone else. A later myth, in a version by Olympiodorus, recounts that the child Dionysus, fascinated by his reflection, let himself be cut into pieces by the Titans, who scattered the pieces all over the world. Commentators see in this the fate of a mind so seduced by its own reflection that it lets itself be torn to pieces by its passions. A number of such collective motifs still remain current today, along with their accompanying taboos, and modern psychology suggests new interpretations of them. The demon that appears in the mirror is the projection of repressed images. The death of Narcissus signifies the failure to transfer youthful libido to another person and fixation upon oneself in a process of autoerotic regression.

As for the double (shadow or reflection), nineteenth-century writers (Alfred de Musset, E. T. A. Hoffmann, Edgar Allan Poe, Guy de Maupassant, Rainer Maria Rilke) spent much effort exploring its deadly significance and the regions of the unconscious mind: the image in the mirror is no longer seen as a visual effect, but as a real alter ego. Psychiatry

has described the defense mechanisms by which a pathologically self-centered subject seeks to create a double by expelling a part of himself that is associated with his shameful desires, so that the double, having become a rival, both assuages his anxiety and threatens him with a powerful feeling of guilt.

The importance of the reflection in the mirror in the inception of the ego has been stressed for more than a century in the work of a number of neuropsychiatrists and psychoanalysts, including Henri Wallon, Geza Roheim, and Paul Schilder. In 1938 Jacques Lacan made the “mirror stage” an essential part of his theories on the psychological development of the infant. The infant in front of the mirror moves from awareness of his body in pieces to perceiving his reflection as a single being, and thus acquires a new grasp of symbolic function at the same time that he or she comes to understand the difference between the body and its reflection. The process of visual perception is the reverse of what befell Dionysus, because by looking at themselves infants avoid dismemberment. Françoise Dolto considered this emphasis on visual perception misleading, and preferred the idea of the “unconscious image of the body” created by all the senses. Later, Lacan introduced into his outline the necessary presence of a symbolic third party, the mother whose approval and smile validate the task of recognition. The infant thus returns to the adult: he tests the formative image that the reflection in the mirror has shown him, but he also tests, in turning back to the other, everything which is absent there, the absence of desire. It is indeed this absence, this hidden part, this “other” that the human being continues to seek by questioning the mirror.

SABINE MELCHIOR-BONNET (2005)
Translated from French by Paul Ellis

MISHNAH AND TOSEFTA. The Mishnah is a law code and school book, containing the legal and theological system of Judaism. It was brought to closure about 200 CE under the auspices of the head of the Jewish community of the Holy Land at that time, Yehudah ha-Nasi', and has remained the foundation stone of Judaism from that time to the present. The Tosefta is a collection of supplements to the Mishnah, with approximately three-fourths devoted merely to citation and amplification of the contents of the Mishnah. The other fourth of the whole is constituted by laws essentially autonomous of, but correlative to, the Mishnah's laws. The Tosefta has no independent standing, being organized around the Mishnah. Tosefta was formulated and gathered together some time in the centuries following the closure of the Mishnah, with the fifth century being a safe guess for the time of closure. These two documents together are extensively cited and analyzed in the two Talmuds, one produced in Babylonia about 500 CE, the other in the Land of Israel about 400 CE.

The Mishnah (with the Tosefta) is important in Judaism because it is represented, from the time of its closure onward, as part of “the one whole Torah of Moses, our rabbi,” that is, as revealed to Moses at Sinai by God. The Mishnah and all of the documents flowing from it later on, beginning with the Tosefta and the two Talmuds, thus form an integral part of the canon of Torah, that is, of Judaism. The Torah myth distinguishes two Torahs of Sinai. One is in written form, the other, oral. This oral Torah, encompassing the Mishnah and its continuators and successors, was revealed alongside the written Torah. But it was transmitted in a different way. While, as its name indicates, the one was written down, the other was formulated for memorization, and it was then transmitted in this easily memorized form.

Viewed structurally, the two Torahs of Judaism may be compared to the conception of an old and a new testament in Christianity, thus:

Old Testament = Written Torah (Hebrew scriptures)
New Testament = Oral Torah (Mishnah and its continuators)

The top line on both sides speaks of the same holy book, but with the words particular to Christianity and Judaism, respectively. That is to say, the biblical books that Christians know as the “Old Testament,” Judaism knows as the “written Torah.” The Mishnah is the first and principal expression

of this other Torah, the oral Torah revealed to Moses at Sinai. It thus is as important to Judaism as the New Testament is to Christianity.

CONTENTS. Six divisions, or orders, comprise the Mishnah's system: Zera'im (Seeds, or Agriculture), Mo'ed (Appointed Times), Nashim (Women), Neziqin (Damages, i.e., civil law), Qodashim (Holy Things, i.e., cultic law), and Tohorot (Purities, i.e., cultic taboos). Each division is divided into tractates, and each tractate into chapters and paragraphs. There are, in all, 63 tractates, divided into some 531 chapters.

The critical issue in economic life (i.e., in farming) is treated in the Mishnah's first division, Agriculture, or Seeds. This is in two parts. First, Israel, as tenant on God's holy land, maintains the property in the ways God requires, keeping the rules that mark the land and its crops as holy. Next, the hour at which the sanctification of the land comes to form a critical mass, namely, in the ripened crops, is the moment ponderous with danger and heightened holiness. Israel's will so affects the crops as to mark a part of them as holy, the rest of them as available for common use. The human will is determinative in the process of sanctification.

In the second division, Appointed Times, what happens in the Land of Israel at certain special times, especially in the lunar year, marks off areas of the land as holy in yet another way. The center of the Land of Israel and the focus of its sanctification is the Temple. There the produce of the land is received and given back to God, the one who created and sanctified the Holy Land. At these unusual moments of sanctification, the inhabitants of the Holy Land in their social being in villages enter a state of spatial sanctification. That is to say, the village boundaries mark off holy space, within which one must remain during the holy time. This is expressed in two ways. First, the Temple itself observes and expresses the special, recurring holy time. Second, the villages of the Holy Land are brought into alignment with the Temple, forming a complement and completion to the Temple's sacred being. The advent of the appointed times precipitates a spatial reordering of the land, so that the boundaries of the sacred are matched and mirrored in village and in Temple. At the heightened holiness marked by these appointed times, therefore, the occasion for an affective sanctification is worked out. Like the harvest, the advent of an appointed time, a pilgrim festival, also a sacred season, is made to express that regular, orderly, and predictable sort of sanctification for Israel that the system as a whole seeks.

If for the moment we now leap over the next two divisions, the third and fourth, we come to the counterpart of the divisions of Agriculture and Appointed Times. These are the fifth and sixth divisions, Holy Things and Purities. They deal with the everyday and the ordinary, as against the special moments of harvest, on the one side, and special time or season, on the other.

The fifth division, Holy Things, is about the Temple on ordinary days (i.e., not during appointed times). The

Temple, the locus of sanctification, is conducted in a wholly routine and trustworthy, punctilious manner. The one thing that may unsettle matters is the intention and will of the human actor. This actor, the priest, is subjected to carefully prescribed limitations and remedies.

The division of Holy Things generates its companion, the sixth division, Purities, the one on cultic cleanness. In the sixth division, once we speak of the one place of the Temple, we address, too, the cleanness that pertains to every place. A system of cleanness, taking into account what imparts uncleanness and how this is done, what is subject to uncleanness, and how that state is overcome—that system is fully expressed in response to the participation of the human will. Without the wish and act of a human being, the system does not function. It is inert. Sources of uncleanness, which come naturally and not by volition, and modes of purification, which work naturally, and not by human intervention, remain inert until human will has imparted susceptibility to uncleanness, until, that is, human will introduces into the system some object of uncleanness—food and drink, bed, pot, chair, or pan—that becomes subject to contamination. The movement from sanctification to uncleanness takes place when human will and work initiate it.

This now brings us back to the middle divisions, the third and fourth, Women and Damages, respectively. They take their place in the structure of the whole by showing the congruence, within the larger framework of regularity and order, of human concerns of family and farm, politics and workaday transactions among ordinary people. For without attending to these matters, the Mishnah's system does not encompass what, at its foundations, it is meant to comprehend and order: Israel's whole life. So what is at issue is fully cogent with the rest.

In Women, the third division, attention focuses upon the point of disorder marked by the transfer of that disordering anomaly, woman, from the regular status provided by one man to the equally trustworthy status provided by another. That is the point at which the Mishnah's interests are aroused: once more, predictably, the moment of disorder.

In Damages, the fourth division, are two important concerns. First, there is the paramount interest in preventing the disorderly rise of one person and fall of another, in sustaining the status quo of the economy, of the house and household, of Israel, the holy society in eternal stasis. Second, there is the necessary concomitant in the provision of a system of political institutions to carry out the laws that preserve the balance and steady state of persons.

The third and fourth divisions take up topics of concrete and material concern, the formation and dissolution of families and the transfer of property in that connection, the transactions, both through torts and through commerce, that lead to exchanges of property and the potential dislocation of the state of families in society. They deal with the concrete locations in which people make their lives, household and

street and field, the sexual and commercial exchanges of a given village.

So the six components of the Mishnah's system insist upon two things: first, stability, second, order. They define as a problem something out of line, therefore dangerous. Laws for a woman must be made, in particular, when she changes hands, moving from father to husband, or, in divorce, from husband to father. Laws for the governance of civil transactions must make certain that all transactions produce equal and opposite results. No one emerges larger than when he entered; none is diminished. Equal value must be exchanged, or a transaction is null. The advent of sacred time, as we shall see, not only imposes the opposite of the Temple's rules upon the village. The holy day also has the effect of linking the Israelite to one place, a particular place, his or her village. So for a moment sacred time establishes a tableau and creates a diorama, a still place of perfection in a silent and perfected moment.

CONTEXT. The Mishnah came into being during the first and second centuries of the common era. The document contains ideas likely to have circulated even before the destruction of the Temple in 70 CE, among people whose traditions were carried forward and ultimately written down in the Mishnah itself. But the structure of the system presented by the Mishnah is well attested only after the Bar Kokhba War (c. 132–135). It is attributed principally to authorities who flourished in the middle of the second century. Accordingly, using antecedent ideas and laws, the document came into being at the end of two wars—the first war against Rome (66–73), culminating in the destruction of the Temple, and the second, Bar Kokhba's. Since the Mishnah emerges after a time of wars, the one thing we should expect to find is a message about the meaning of history, an account of events and their meaning. Central to the Mishnah's system might well be a picture of the course of Israel's destiny, in the tradition of the biblical histories—*Samuel*, *Kings*, or *Chronicles*, for instance—and in the tradition of the prophets of ancient Israel, the several Isaiahs, Jeremiah, and the rest.

The Mishnah's principal point of insistence is the opposite. It speaks of what is permanent and enduring: the flow of time through the solar seasons, marked by lunar festivals and Sabbaths; the procedures of the cult through the regular and enduring sacrifices; the conduct of the civil society through norms of fairness to prevent unjust change; the pursuit of agricultural work in accord with the rules of holiness; the enduring, unchanging, invisible phobias of cultic uncleanness and cleanness. The Mishnah has no division devoted to the interpretation of history. There is no pretence even at telling what had just happened. There is scarcely a line to address the issue of the meaning of the disasters of the day.

The Mishnah does not address one-time events of history. Its laws express recurrent patterns, eternal patterns as enduring as the movement of the moon and sun around the earth (as people then understood it) and as regular as the lap-

ping of the waves on the beach. These are laws on plowing, planting, harvesting; birth, marriage, procreation, death; home, family, household; work, rest; sunrise, sunset—private lives, not the stuff of history. The laws speak of the here and now, not of state or of tradition, past or future. Since, in the time in which the ideas of the Mishnah took shape, most other Jews expressed a keen interest in history, the contrast cannot be missed. The Mishnah imagines a world of regularity and order in the aftermath of the end of ancient certainties and patterns. It designs laws after the old rules all were broken. It speaks of an eternal present—generally using the continuous present tense and describing how things are—to people beyond all touch with their own past, its life and institutions.

Since, as we know, in the aftermath of the war against Rome in 132–135, the Temple was declared permanently prohibited to Jews, and Jerusalem was closed off to them as well, the Mishnah's laws in part speak of nowhere and not now. Why not? There was no cult, no Temple, no holy city, to which at this time the description of the Mishnaic laws applied. Much of the Mishnah deals with matters to which the sages had no material access. They had no practical knowledge at the time of their work on cultic law. They themselves were not members of the priestly caste. Yet we have seen that the Mishnah contains a division on the conduct of the cult, namely, the fifth, as well as one on the conduct of matters so as to preserve the cultic purity of the sacrificial system along the lines laid out in the *Book of Leviticus*, the sixth division.

There is a further point of unreality. Many of the tractates of the first division, on agriculture, deal with the rations provided for the priests by the Israelite farmers out of the produce of the holy land. The interests of the division overall flow from the Levitical taboos on land use and disposition of crops; the whole is an exercise of most acute interest to the priests.

Furthermore, a fair part of the second division, on appointed times, takes up the conduct of the cult on special days, the sacrifices offered on Yom Kippur, Passover, and the like. Indeed, what the Mishnah wants to know *about* appointed seasons concerns the cult far more than it does the synagogue, which plays a subordinate and trivial role.

The fourth division, on civil law, for its part, presents an elaborate account of a political structure and system of Israelite self-government based on Temple, priesthood, and monarchy, in tractates *Sanhedrin* and *Makkot*, not to mention *Shavu'ot* and *Horayot*. This system speaks of king, priest, Temple, and court. Not the Jews, kings, priests, and judges but the Romans conducted the government of Israel in the Land of Israel in the time in which the second-century authorities did their work.

Well over half of the document—the first division, the second, part of the fourth, all of the fifth, and most of the sixth—speaks of cult, Temple, government, priesthood. But

these things did not yet exist. They derived, moreover, from other groups in Israelite society. The Mishnah takes up a profoundly priestly and Levitical conception of sanctification as the principal statement on Israel's condition. Sages had no control of these matters. Furthermore, in the very time the document was written, the Temple lay in ruins, the city of Jerusalem was prohibited to all Israelites, and the Jewish government and administration, which had centered on the Temple and based its authority on the holy life lived there, were in ruins. So the Mishnah's sages could not report any facts they had observed on their own. Much of the Mishnah speaks of matters not current at the time it was created because the Mishnah's sages wished to make a statement on what really matters: the holiness of Israel as they defined it.

LATER DEVELOPMENTS. From what has been said, we should never be able to account for the persistence of the Mishnah as half of the whole "Torah" of Judaism. The bulk of the document was irrelevant to its own time, all the more so to the ages that would follow. The two Talmuds, indeed, pick and choose what they want from the Mishnah, and, in so doing, revise the system of the whole. The Talmud of the Land of Israel, for example, provides elaboration and commentary for only thirty-nine of the Mishnah's sixty-two tractates, omitting reference to the fifth and nearly the whole of the sixth division. The Babylonian Talmud, for its part, treats the fifth division but ignores nearly all of the first. What both Talmuds do in common is ignore the system and structure of the whole and divide the Mishnah into tiny bits and pieces. These were then subjected to close and thorough analysis. The upshot is that the two Talmuds took up the whole. By continuing what Yehudah ha-Nasi' had treated as concluded, they carried forward the unending process of revelation and canon. That is to say, the heirs of the Mishnah revered the document but also took responsibility for interpreting it. In the very process of their quite accurate and careful reading, they in fact accomplished a considerable reformation of the Mishnah itself.

Tosefta

The best edition is Saul Lieberman's *Tosefta*, 3 vols. (New York, 1955–1967), including *Zera'im* (1955), *Mo'ed* (1962), and *Nashim* (1967), together with a monumental commentary by the same scholar. For the other three divisions, M. S. Zuckerman's *Tosefta'* (1881) is available. I have made an English translation of the second through the sixth divisions in *The Tosefta, Translated from the Hebrew*, vols. 2–6 (New York, 1977–1981). A brief scholarly account is Moshe David Heer's "Tosefta," in *Encyclopaedia Judaica*, vol. 15 (Jerusalem, 1971).

Mishnah

The best available edition, including a commentary, is Chanoch Albeck's *Shishah Sidrei Mishnah* (Tel Aviv, 1952ff.). No critical edition exists. Herbert Danby has made a one-volume translation in *The Mishnah* (London, 1933), and I have

made a complete translation and commentary on the second through the sixth divisions of the Mishnah and Tosefta in *A History of the Mishnaic Law* (Leiden, 1974–); included in the latter work are *Appointed Times*, 5 vols. (1981ff.), *Women*, 5 vols. (1980), *Damages*, 5 vols. (1983–1984), *Holy Things*, 6 vols. (1979–1980), and *Purities*, 22 vols. (1974–1977). An account of how the Mishnah has been studied in classical and modern times is given in my edition of *The Modern Study of the Mishnah* (Leiden, 1973), and the religious world view of the Mishnah is described and interpreted in my book *Judaism: The Evidence of the Mishnah* (Chicago, 1981). A brief introduction, presenting a quite different approach, is E. E. Urbach's "Mishnah," in *Encyclopaedia Judaica*, vol. 12 (Jerusalem, 1971).

MISSIONS: MISSIONARY ACTIVITY

Many records and some suggestive studies of the foundations, motivations, dynamics, techniques, and sociocultural effects of missionary activity in specific locales exist. Most of them are written from the perspective of the missionaries or are based on the study of records, letters, or fund-raising reports they have left. Certain encounters between the major religious orientations in various parts of the world have also been documented, but few systematic, cross-cultural, and comparative studies of missions and missionary activities have been produced.

There is no lack of material dealing with the dissemination of and conversion to a specific religion from the standpoint of that religion's advocates, nor of the theological warrants or mandates given by a particular faith for its propagation. Cultural historians and social scientists have also studied the effects of religious change in specific periods,

and psychologists have attempted to identify the psychodynamics of conversion. Still, systematic overviews of organized proselytism and the basic ideational, social, and institutional foundations on which it rests remain sparse.

In the nineteenth century, to be sure, certain evolutionary theories of the development of “high” cultures offered rather triumphalist accounts of the spread of “ethical religions” over territories where “animistic” or “polytheistic” faiths previously claimed the loyalties of the people. And in the early twentieth century certain theories of religio-cultural “diffusion” attempted to comprehend world historical development in ways that would also account for the spread of religions by analogy with the spread of artifacts such as the plow or the clock. Theories of political-economic and cultural imperialism have gained considerable prominence as a framework for interpreting missionary activity, a fact that will require comment here. None of these efforts, however, has resulted in a compelling account of the nature, character, and dynamics of missionary activities that bear cross-cultural scrutiny.

Near the end of the twentieth century, after the end of the cold war that occupied much of the world’s attention, many became aware that governments, policies, and economic systems pass away, but that religions endure and seem to be able to renew themselves, even in areas where they were thought to be surpassed. The idea that modernization meant “progress” and inevitable secularization seems to have died a thousand deaths. In fact, the religions have undergone a substantial resurgence and have amazed and troubled no small number of social theorists, historians, and liberal religious scholars. The troubling part of this resurgence for many is that the world religions have reasserted themselves in conservative and fundamentalist forms. Some religions are local, tribal, or ethnic in character, and they often seek to recover eroding identity in the face of globalizing developments. More amazing is the fact that an enormous range of peoples have converted to Christianity and, to a somewhat lesser degree, to the other great world religions in the age that was assumed to be, according to enlightened orthodoxy, an age in which the religious illusions of the past were demystified by scientific fact. It turns out that the facts suggest that the religions in their conservative forms are engaging in vigorous missionary activity and converting the world. Why this is so is not altogether clear to observers and critics. Yet the evidence is rather clear. Evangelical, Pentecostal, fundamentalist, and heterodox (e.g., “Mormonism”) forms of Christianity have been growing around the world at a record pace, as have the more militant forms of Islam, Hinduism, and Buddhism. Tribal religions, reemerging as ethnic identity religions, have erupted into fits of violence and “ethnic cleansing.” The study of these dynamics continues, with many dynamics being obvious, though the are causes not.

FOUNDATIONS AND MOTIVATIONS. Nonetheless it is possible to venture some generalizations about missionary activity that seem relevant for all the great missionizing religions.

The first point is that they all seem to be impelled by a unique revelation or a great discovery about the nature of being and existence, the discovery of which prompts a momentous personal transformation and a revitalization of social and cultural purpose given by an awareness of transcendence that brings spiritual and moral renewal. This generates a salvific metaphysical-moral vision that is not only of intense personal meaning but also thought to be of universal import for humanity. This vision induces a passion that intellectually, morally, and emotionally is felt by those grasped by it from magical practices of local deities and cults, from familial, clan, caste, or ethnic loyalties, from feeble or dysfunctional political-economic conditions, and from “meaningless” or ineffective rites and rituals. The missionary impulse that grows from this source becomes “homeless,” for it finds its true home in a realm that relativizes all that is understood to be natural or conventional, which it then tries either to escape or to transform. It further evokes a desire to bring about the universal acceptance and application of the vision, which it holds to be universally true in principle, even if it is not universally accepted.

Every missionizing religion thus is by definition trans-cultural; where it is not entirely transmundane, it is cosmopolitan. It endows its advocates with a transcendental, ecumenical, cross-cultural, and global perspective, and it understands humanity to be trapped in chaotic states of mental, spiritual, social, or physical oppression from which humanity must be delivered by accepting a new foundation of meaning and a new discipline. It thereby promises to liberate humanity from evil and falsehood and bind humans to the good and true—although the precise definitions of the causes of the evil and the nature of the good, the marks of falsehood and the indicators of the true, and the means that are able to move humanity from one to the other are what divide these religions from each other.

A missionary is one who seizes or is seized by a universalistic vision and who feels a mandate, a commission, or a vocation to bring the vision and its benefits to “all.” Thus missionary activity, both domestic and foreign, is the most intense in those moments when the metaphysical-moral vision of a religion is engendered or revitalized and held to be particularly pertinent in changing conditions. “Home” missions often take the form of new programs for youth, “purification” of religious and cultural practice, proselytism of marginal groups, protest against lax practices among the social elite (including the established clergy), and often moral or spiritual attempts to put domestic social, political, and economic policies on a new foundation. “Foreign” missions attempt to take the vision beyond the land of origin and thereby to lay the foundations for a new spiritual world order by transforming the souls and minds of individuals and the social habits of society. Missionary activity always alienates its converts from previous belief and practice to some degree, for it introduces a different way of organizing faith and life. Both domestic and foreign missionary activity is marked by

intense intellectual activity, for the whole of reality has to be reconsidered from the new perspective. It also is the breeding ground of freedom, for in conversion a person finds that he or she can make an ultimate choice about, or be drawn by grace into, a new relationship to the truly divine. Such a person no longer has an identity determined by age, gender, class, custom, status, ethnicity, or the dictate of any lesser authority—parental or political, cultural or economic. Having been drawn into freedom, all other areas of life are subject to reevaluation and reconstruction.

One or another universalistic vision has provided the foundations and motivations for Buddhism, Christianity, Islam, and that fading secular “civil religion,” Communism, to name but four of the most obvious missionizing faiths. Certain strands and periods of Judaism, Zoroastrianism, and “syncretistic” religions, such as Baha’i, Sikhism, and the Unification Church (Moonies) have a similar dynamic. A universalistic metaphysical-moral vision is less pronounced, however, in the beliefs of the primal religions, Daoism and Shintōism, and is less overt in Confucianism and most strands of Judaism and Zoroastrianism. However great their spiritual, moral, and intellectual achievements, these latter religions are constitutively tied to specific sociopolitical contexts and often to ethnic particularities. These religions may also claim to possess a universalistic message—they may welcome converts, and aspects of their metaphysical-moral visions may be honored or adopted by other religions, but they spread more by the migrations of peoples or by the gradual incorporation of immediate neighbors than by organized missionary activities. They are, as some say, the “staying” religions, in contrast to the “going” religions.

Hinduism represents a special and exceedingly complex case, for while it is similar to nonmissionizing traditions in many respects, and while it seems to have spread essentially by a process called sanskritization (the gradual adoption of Vedic practices and Brahmanic authority by non-Aryan peoples on the Indian subcontinent), it has had periods of vigorous missionary activity. Indeed, active missions have not only been carried out by “evangelical” forms of Hinduism, such as the Ramakrishna Mission, the International Society for Krishna Consciousness (ISKCON), and the organizations supporting the teachings and charitable works of Sai Baba, but are being actively pursued in another way by the *Hindutva* movement. Represented in its political mode by a Hindu nationalist party that presently heads the Indian government, a series of related “safran” groups (made up of priests and “holy men”) and lay militant activists are seeking to “convert” Dalit and tribal groups into their “original” status as part of the religious and cultural fabric of the “Indic” peoples and to “deconvert” former Hindus who have become Muslim, Christian, or neo-Buddhist. Their methods often include persuasion, aid in building local temples, and promised access to educational and medical opportunity, but they also sometimes use violence against mosques, churches, and *stūpas*; against minorities who resist their efforts; or against

missionaries from such religions. Many see this movement as a threat not only to other faiths but to the democracy, socialism, and human rights guaranteed by the Indian constitution, principles that, since Gandhi, have been held by many as almost sacred.

Most initial efforts to spread the faith focus rather strictly on the message of salvation, presented in its simplest forms. This is partly a matter of conviction. It is often also a matter of necessity—in authoritarian cultures, it is dangerous to begin pointing out all the social implications that a conversion might eventually entail. This is not to say that when missionizing religions expand they cease to have cultural, political, ethnic, or economic content and become purely transcendental, for that is seldom the case. Rather, missionaries often believe that they have a message based on a salvific metaphysical-moral vision, which is in fundamental respects separable from accidental sociohistorical trappings and thus able to be transplanted into new cultural settings. This is true even if the bearers of the message believe that at its core are implications for ethical changes in society that ought also to be spread for the well-being of humanity. Those living religions that claim the most universalistic visions and evidence the most extensive missionary zeal beyond the place of origin—Buddhism, Christianity, Islam, and indeed Communism—have never been able to extricate themselves fully from the social contexts in which they were developed nor from the unintended consequences that follow from the transplanting of the faith.
